The verb "to list," most commonly found in the imperative, meaning "hark!" is another form of "listen," and is to be referred, as to its ultimate origin, to an Indo-European root klu-, seen in Gr. λίστος, to hear, λίστος, glory, renown, and in the English "louder." The same root is seen in Welsh lêst, and Irish leas, etc. Another word "list," meaning pleasure, delight, or, as a verb, meaning "to please, choose," is chiefly found in such phrases as "the wind was listeth." This is from the O. E. lyston, cf. Dut. lusten, and is connected with the root listed, and with the English doublet "lust," now always used in the sense of an evil or more particularly sexual desire. It is probably an application of this word, in the sense of "inclination," that has given rise to the nature of "list," as in "to list the head," to list for pleasure; "list" for pain, "to list a head," and the like.

LISTA Y ARAGON, ALBERTO (1775-1848), Spanish poet and educationalist, was born at Seville on the 15th of October 1775. He began teaching at the age of fifteen, and when little over twenty was made professor of elocution and poetry at Seville university. In 1813 he was exiled, on political grounds, but pardoned in 1817. He then returned to Spain and, after teaching for three years at Bilbao, started a critical review at Madrid. Shortly afterwards he founded the celebrated college of San Mateo in that city. The liberal character of the San Mateo educational system was not favoured by the government, and in 1823 the college was closed. Lista after some time spent in Bayonne, Paris and London was recalled to Spain in 1853 to edit the official Madrid Gazette. He was one of the founders of the Ateneo, the free university of Madrid, and up till 1840 was director of a college at Cadiz. All the leading spirits of the revolution of 1820, statesmen, writers, soldiers and diplomats came under his influence. He died at Seville on the 5th of October 1848.

LISTER, JOSEPH LISTER, 1st BARON (1827-1912), English surgeon, was born at Upton, in Essex, on the 5th of April 1827. His father, Joseph Jackson Lister, F.R.S., was eminent in science, especially in optical science, his chief claim to remembrance being that by certain improvements in lenses he raised the compound microscope from the position of a scientific toy, "distorting as much as it magnified," to its present place as a powerful engine of research. Other members of Lord Lister's family were eminent in natural science. In his boyhood Joseph Lister was educated at Quaker schools; first at Hitchin in Hertfordshire, and afterwards at Totterdown, near Bristol. In 1847 he entered University College, London, as a student in arts, and took his B.A. degree at the University of London in 1847. He continued at University College as a medical student, and became M.B. and F.R.C.S. in 1852. The keen young student was not long in bringing his faculties to bear upon pathology and the practice of medicine. While house-surgeon at University College Hospital, he had charge of certain cases during an outbreak of hospital gangrene, and carefully observed the phenomena of the disease and the effects of treatment upon it. He was thus early led to suspect the parasitic nature of the disorder, and searched with the microscope the material of the spreading sore, in the hope of discovering in it some invading fungus; he soon convinced himself of the cardinal truth that its causes were purely local. He also minutely investigated cases of pyaemia, another terrible scourge of hospitals at that time,
and made camera lucida sketches of the appearances revealed by the microscope.

To realize Lister's work it is necessary to remember the condition of surgical practice at that date. About the middle of the 19th century the introduction of anaesthetics had relieved the patient of much of the horror of the knife, and the surgeon of the duty of speed in his work. The agony of the sufferer had naturally and rightly compelled the public to demand rapid if not slapdash surgery, and the surgeon to pride himself on it. Within decent limits of precision, the quickest craftsman was the best. With anaesthetics this state of things at any rate was changed. The pain of the operation itself no longer counted, and the surgeon was enabled not only to be as cautious and seluous as dexterous, but also to venture upon long, profound and intricate operations which before the introduction of anaesthetics were unhappily too frequently in every sense the death warrant of the old; and even scrupulous care in ventilation and housemaids' cleanliness failed to prevent the devastation. Surgery had enlarged its freedom, but only to find the weight of its new responsibilities more than it could bear.

When Lister was appointed to the chair of surgery in Glasgow the infirmary of that city was a hotbed of septic disease; so much so that his hospital visits evidently distressed him greatly. Windows were widely opened, piles of clean towels were supplied, but still the pestilence stalked through the wards. The building stands to-day as it stood then, with no substantial alteration; but by the genius of Lister its surgical wards are now as free from septic accidents as the most modern hospital in the land. James Simpson, early in the 'sixties, pathetically denounced the hospital surgery to the public and the officers and surgeons uttered desperate protests against the hospital system itself; yet, not long afterwards, Lister came to prove that it was not in the hospital that the causes of that mortality lay hidden, but in the operator himself, his tools and his assistants. Happily this beneficent discovery was made in time to preserve the inestimable boon of the hospital system from the counsels of despair. When Lister took up the task speculation was on the wrong tack; the oxygen of the air was then supposed to be the chief cause of the dissolution of the tissues, and to prevent access of air was impossible. For instance, a simple fracture, as of a bone of the leg, would do perfectly well, while in the very next bed a compound fracture—one, that is, where the skin is lacerated, and access to the seat of injury opened out—would go disastrously wrong. If the wound was amputated, and the amputated stump of such cases of amputation succumbed to septic poisoning.

On graduation as bachelor of medicine, Lister went to Edinburgh, where he soon afterwards became house-surgeon to Mi Syme; and he was much impressed by the skill and judgment of this great surgeon, and also by the superiority of his method of dressing recent wounds with dry lint, as compared with the "water dressing" in use at University College. Yet under these more favourable conditions the amelioration was only one of degree; in most wounds indeed "union by first intention" was rendered impossible by the presence of the silk ligatures employed for restringing bleeding, for these could come away only by a process of suppuration. On the expiry of his house-surgery in Edinburgh, Lister started in that city an extra-academical course of lectures on surgery; and in preparation for these he entered on a series of investigations into inflammation and allied subjects. These researches, which were detailed fully in three papers in Phil. Trans. (1859), and in his Croonian lecture at the Royal Society in 1863, testified to an earnestness of purpose, a persevering accuracy of observation and experiment and an insight of scientific conception which show that if Lister had never developed the aseptic method of surgery, he would have taken a very high place in pathology. In his speech in Paris at the Thirteenth International Congress of Medicine in 1900, Lord Lister said that he had done no more than seize upon Pasteur's discoveries and apply them to surgery. But though Lister saw the vast importance of the discoveries of Pasteur, he saw it because he was watching on the heights; and he was watching there alone. From Pasteur Lister derived no doubt two fruitful ideas: first, that decomposition in organic substances is a "germ" process, and secondly that these slowly decomposing minute forms of vegetable life spring always, like higher organisms, from parents like themselves, and cannot arise de novo in the animal body. After his appointment to the Glasgow chair in 1860, Lister had continued his researches on inflammation; and he had long been led to suspect that decomposition of the blood in the wound was the main cause of suppuration. The two great theories established by Pasteur seemed to Lister to open out the possibility of what had before appeared hopeless—namely, the prevention of putrefaction in the wound, and consequently the forestalling of suppuration. To exclude the oxygen of the air from wounds was impossible, but it might be practicable to protect them from microbes.

The first attempt to realize this idea was made upon compound fractures; and the means first employed was carbolic acid, the remarkable efficacy of which in deodorizing sewage made Lister regard it as a very powerful germicide. It was applied to the wound undiluted, so as to form with the blood a dense crust, the surface of which was painted daily with the acid till all danger had passed. The results, after a first failure, were in the highest degree satisfactory, so that, as Lister said in his presidential address to the British Association in Liverpool, he "had the joy of seeing these formidable injuries follow the same safe and tranquil course as simple fractures." The caustic property of undiluted carbolic acid, though insignificant in comparison with the far greater evils to be avoided in compound fracture, made it unsuited for general surgery. To make it applicable to the treatment of abscesses and incised wounds, it was necessary to concentrate it by boiling with some inorganic body; and the endeavour to find the best medium for this purpose, such as to combine perfect antiseptic efficiency with the least possible irritation of the tissues, formed the subject of experiments continued for many years in the laboratory and in the ward. At one stage in these inquiries an attempt was made to provide an atmosphere free from living organisms by means of a fine spray of a watery solution of carbolic acid; for it was then supposed by Lister to be necessary not only to purify the surgeon's hands and instruments and the skin of the patient about the seat of operation, but also to wage war with the microbes which, as Pasteur had shown, people every cubic inch of the air of an inhabited room. Under the use of the spray better results were obtained than ever before, and this success encouraged its application by large and systematic examination of the relations of the blood to micro-organisms led Lister to doubt the harmfulness of the atmospheric dust. At the London Congress in 1881 he narrated experiments which proved that the serum of the blood is a very unfavourable soil for the development of the bacteria diffused through the air, and others which showed that the cells of an organizing blood-clot have a very remarkable power of disposing of microbes and of limiting their advance. Hence he considered it probable that in surgical operations the atmosphere might be disregarded altogether. As long, however, as this was only a matter of probability, he did not dare to discard the spray. But at length, at the Berlin Congress in 1890, he was able to announce that the certainty he had so long desired had been arrived at. A careful consideration of the physical

1 See Trans. of the International Medical Congress (1881), vol. ii. p. 373.
constitution of the spray had shown him that the microbes of the dust involved in its vortex could not possibly have their vitality destroyed or even impaired by it. Such being the case, the uniform success obtained when he had trusted the spray implicitly as an aseptic atmosphere, abandoning completely certain other precautions which he had before deemed essential, proved conclusively to his mind that the air might safely be left entirely out of consideration in operating.\(^1\) Thus he learnt that not the spray only, but all antiseptic irrigations or washings of the wound also, with their attendant irritation of the cut surfaces, might be dispensed with—a great simplification, indirectly due to experiments with the spray. The spray had also served a very useful purpose by maintaining a pure condition of the entourage of the operation; not indeed in the way for which it was devised, but as a very mild form of irrigation. And Lister took care to emphasize the necessity for redoubled vigilance on the part of the surgeon and his assistants when this "unconscious caretaker," as he called it, had been discarded.

The announcement that he had given up the spray was absurdly interpreted in some quarters to mean that he had virtually abandoned his theory and his antiseptic methods. The truth is that the spray was only one of many devices tried for an end in themselves for the long-continued endeavour to apply the antiseptic principle to the best advantage, and abandoned in favour of something better. Two main objects were always kept steadily in view by him—during the operation to guard the wound against septic microbes by such means as existing knowledge indicated, and afterwards to protect it against their introduction, avoiding at the same time all needless irritation of the tissues by the antiseptic. Upon the technical methods of attaining these ends this is not the place to enlarge; suffice it to say that the endowments and the industry of the discoverer, as seen in the rapidity and flexibility of mind with which he seized upon and selected the best means, were little less remarkable than the activity of the same faculties in his original ideas.

To illustrate this opinion, his work on the ligature may be taken. It had long been the universal practice of surgeons to employ threads of silk or flax for tying arteries, long ends being left to provide escape of the pus (invariably formed during the tedious process of the separation of the ligature) together with the portion of the arterial coats included in the knot. Lister thought if, by antiseptic means, the thread were deprived of living material, that would no longer cause suppuration, and he left with short cut ends to become embedded permanently among the tissues of the wound, which thus would be allowed to heal by primary union throughout. A trial of this method upon the carotid artery of a horse having proved perfectly successful, he applied it in a case of aneurism in the human subject; and here again the immediate results were all that could be desired. But a year later, the patient having died from other causes, the necropsy showed remnants of the silk thread incompletely absorbed, with appearances around them which seemed to indicate that they had been acting as causes of disturbance. Thus was suggested to him the idea of employing for the ligature some material susceptible of more speedy absorption; and the antiseptic treatment of contused wounds having shown that dead tissue, if protected from putrefaction, is removed by the surrounding structures without the intervention of suppuration, he resolved to try a thread of some such nature. Catgut, which is prepared from one of the constituents of the small intestine of the sheep, after steeping in a solution of carbolic acid, was used in a preliminary trial upon the carotid artery of a calf. The animal was killed a month later, when, on dissection, a very beautiful result was disclosed. The catgut, though removed had not been simply absorbed; pari passu with its gradual removal, fibrous tissue of new formation had been laid down, so that in place of the dead catgut was seen a living ligature embracing the artery and incorporated with it. The wound meanwhile had healed without a trace of suppuration. This success appeared to justify the use of the catgut ligature in the

\(^1\) See Verhandlungen des X internationalen Congresses, Bd. i. p. 33.

human subject, and for a while the results were entirely satisfactory. But though this was the case with the old samples of catgut first employed, which, as Lister was afterwards led to believe, had been "seasoned" by long keeping, it was found that when catgut was used fresh as it comes from the makers, it was unsuited in various ways for surgical purposes. The attempt by special preparation to obtain an article in all respects trust-worthy engaged his attention from time to time for years afterwards. To quote the words of Sir Hector Cameron, who was for several years assistant to Lord Lister, it required "labour and toilsome investigation and experiment of which few can have any adequate idea."

In 1869 Lister succeeded his father-in-law, Syme, in the chair of clinical surgery of Edinburgh. In 1877 he accepted an invitation to the chair of surgery at King's College, London, in the anticipation that here he would be more centrally placed for communication with the surgical world at home and abroad, and might thus exercise his beneficent mission to more immediate advantage. In 1886 Lister retired from practice, but not from scientific study. From 1895 to 1900 he was President of the Royal Society. In 1893 he was created a baronet, and in 1897 he was raised to the peerage as Baron Lister of Lyme Regis. The appointment in Connaught house, in 1901, he was nominated an original member of the new Order of Merit.

In England Lister's teaching was slow in making its way. The leading surgeons of Germany were among the first to seize upon the new idea with avidity and practical success; so early as 1875, in the course of a tour he made on the Continent, great festivals were held in his honour in Munich and Leipzig. The countrymen of Pasteur did not lag far behind; and it is no exaggeration to speak of Lister's appearances in foreign countries at this time as triumphant.

The relation of Semmelweiss to Lister is of historical importance. Lister's work on the antiseptic system began in 1861; his first publication on the subject was in March 1867. At this date, and for long afterwards, Semmelweiss was unknown, or ignored, not only by French and Germans, but also by his own Hungarian people; and this neglect broke his heart. The French Academy pronounced against his opinions, and so did the highest pathological authority in Germany. In England, till long after his death, probably his name was not so much as mentioned. In the early 'seventies Lister's method was in full operation in Hungary as elsewhere, yet none of the surgeons of Budapest ever mentioned Semmelweis; nor even when in 1885 they gave a great banquet to Lister. It was after this occasion that Dr Duka, a Hungarian physician practising in London, wrote a biography of Semmelweis, which he sent to Lister, and thus brought Semmelweis before him for the first time. Thenceforward Lister generously regarded Semmelweis as in some measure his forerunner; though Semmelweis was not aware of the microbial origin of septic poisons, nor were his methods, magnificent as was their success in lying-in hospitals, suitable for surgical work.

In public Lord Lister's speeches were simple, clear and graceful, avoiding rhetorical display, earnest for the truth, jealous for his science and art, forgetful of himself. His writings, in like manner plain, lucid and forcible, scarcely betray the labour and thought of their production. With the courtesy and serenity of his carriage he combined a passionate humanity, so often characteristic of those who come of the Society of Friends, and a simple love of truth which showed itself in his generous encouragement of younger workers.

(L. C. A.)

**LISTER, MARTIN** (c. 1638–1712), English naturalist and physician, was born at Radcliffe, near Buckingham. He was nephew of Sir Matthew Lister, physician to Anne, queen of James I, and to Charles I. He was educated at St John's College, Cambridge, 1655, graduated in 1658/9, and was elected a fellow in 1660. He became F.R.S. in 1671. He practised medicine at York until 1683, when he removed to London. In 1684 he received the degree of M.D. at Oxford, and in 1687 became F.R.C.P. He contributed numerous articles on natural history, medicine and antiquities to the **Philosophical**
LISTON, J.—LISZT

Transactions. His principal works were Historiae animalium Anglociae (1787), Historiae Conchyliorum (1825—1826), and Conchyliorum Brevilium (1826). As a conchologist he was held in high esteem, but while he recognized the similarity of fossil mollusca to living forms, he regarded them as inorganic imitations produced in the rocks. In 1783 he communicated to the Royal Society (Phil. Tran. 1684). An ingenious proposal for a new sort of maps of countries; together with tables of sands and clays, such as are chiefly found in the north parts of England. In this essay he suggested the preparation of a soil or mineral map of the country, and thereby is justly credited with being the first to realize the importance of a geological survey. He died at Epsom, the 2nd of February 1792.

LISTON, John (c. 1776—1846), English comedian, was born in London. He made his public début on the stage at Weymouth as Lord Duberley in The Heir-at-law. After several dismal failures in tragic parts, some of them in support of Mrs Siddons, he discovered accidentally that his forte was comedy, especially in the personation of old men and country boys, in which he displayed a fund of drollery and broad humour. An introduction to Charles Kemble led to his appearance at the Haymarket on the 10th of June 1805 as Sheepface in the Village Lawyer, and his association with this theatre continued with few interruptions until 1830. Paul Pry, the most famous of all his impersonations, was first presented on the 13th of September 1825, and soon became, thanks to his creative genius, a real personage. Liston remained on the stage till 1837; during his last years his mind failed, and he died on the 22nd of March 1846. He had married in 1807 Miss Tyrer (d. 1845), a singer and actress. Several pictures of Liston in character are in the Garrick Club, London, and one as Paul Pry in the South Kensington Museum.

LISTON, Robert (1794—1847), Scottish surgeon, was born on the 28th of November 1794 at Ecclesmachan, Linlithgow, where his father was parish minister. He began the study of anatomy under Dr John Barclay (1758—1826) at Edinburgh in 1810, and soon became a skilful anatomist. After eight years, he became a lecturer on anatomy and surgery in the Edinburgh School of Medicine; and in 1827 he was elected one of the surgeons to the Royal Infirmary. In 1835 he was chosen professor of clinical surgery in University College, London, and this appointment he held until his death, which occurred in London on the 7th of December 1847. Liston was a teacher more by what he did than by what he said. He taught simplicity in all operative procedures; fertile in expedients, of great nerve and of powerful frame, he is remembered as an extraordinarily bold, skilful and rapid operator. He was the author of The Elements of Surgery (1831—1832) and Practical Surgery (1837), and made several improvements in methods of amputation, and in the dressing of wounds.

LISZT, Franz (1811—1886), Hungarian pianist and composer, was born on the 22nd of October 1811, at Raiding, in Hungary. His appeal to musicians was made in a threefold capacity, and we have, therefore, to deal with Liszt the unrivalled pianoforte virtuoso (1829—1848); Liszt the conductor of the “music of the future” at Weimar, the teacher of Tausig, Bülow and a host of lesser pianists, the eloquent writer on music and musicians, the champion of Berlioz and Wagner (1848—1861); and Liszt the prolific composer, who for some five-and-thirty years continued to put forth pianoforte pieces, songs, symphonic orchestral pieces, cantatas, masses, masses and oratorios (1847—1882). As virtuoso he held his own for the entire period during which he chose to appear in public; but the militant conductor and prophet of Wagner had a hard time of it, and the composer’s place is still in dispute. Liszt’s father, a clerk to the agent of the Esterhazy estates and an amateur musician himself, was Hungarian by birth and ancestry, his mother an Austrian-German. The boy’s gifts attracted the attention of certain Hungarian magnates, who furnished 600 gulden annually for some years to enable him to study music at Vienna and Paris. At Vienna he had lessons in pianoforte playing from Carl Czerny of “Velocity” fame, and from Salieri in harmony and analysis of scores. In his eleventh year he began to play in public there, and Beethoven came to his second concert in April 1823. During the three years following he played in Paris, the French provinces and Switzerland, and paid three visits to England. In Paris he had composition lessons from Paër, and a six months’ course of lessons in counterpoint from Reicha. In the autumn of 1825, the handsome and fascinating enfant gâté of the salons and ateliers —“La Neuvième Merveille du monde”—had the luck to get an opérette (Don Sancho) performed three times at the Académie Royale. The score was accidentally destroyed by fire, but a set of studies à la Czerny and Cramer, belonging to 1826 and published at Marseilles as 12 Études, op. 1, is extant, and shows remarkable precocity. After the death of his father in 1828 young Liszt led the life of a teacher of the pianoforte in Paris, got through a good deal of miscellaneous reading, and felt the influence of the religious, literary and political aspirations of the time. He attended the meetings of the Saint-Simons, lent an ear to the romantic mysticism of Père Enfantin and later to the teaching of Abbé Lamennais. He also played Beethoven and Weber in public—a very courageous thing in those days. The appearance of the violinist Pagani in Paris, 1831, marks the starting-point of the supreme eminence Liszt ultimately attained as a virtuoso. Pagani’s marvellous technique inspired him to practise as no pianist had ever practised before. He tried to find equivalents for Pagani’s effects, transcribed his violin caprices for the piano, and perfected his own technique to an extraordinary degree. After Pagani he received a fresh impulse from the playing and the compositions of Chopin, who arrived in 1831, and yet another impulse of equal force from a performance of Berlioz’s “ Symphonie Fantastique, the episode of la vie d’un artiste,” in 1832. Liszt transcribed this work, and its influence ultimately led him to the composition of his “Pépôles symphoniques” and other examples of orchestral programme-music.

From 1835 to 1848—when he gave up playing in public—he was greeted with frantic applause as the prince of pianists. Five years (1835—1840) were spent in Switzerland and Italy, in semi-retirement in the company of Madame la comtesse d’Agoult (George Sand’s friend and would-be rival), known in literary circles as “Daniel Stern,” by whom Liszt had three children, one of them afterwards Frau Cosima Wagner); these years were devoted to further study in playing and composition, and were interrupted only by occasional appearances at Geneva, Milan, Florence and Rome, and by annual visits to Paris, when a famous contest with Thalberg took place in 1837. The enthusiasm aroused by Liszt’s playing and his personality—the two are inseparable—reached a climax at Vienna and Budapest in 1839—1840, when he received a patent of nobility from the emperor of Austria, and a sword of honour from the magnates of Hungary in the name of the nation. During the eight years following he was heard at all the principal centres—including London, Leipzig, Berlin, Copenhagen, St Petersburg, Moscow, Warsaw, Constantinople, Lisbon and Madrid. He gained much money, and gave large sums in charity. His munificence with regard to the Beethoven statue at Bonn made a great stir. The subscriptions having come in but spasmodically, Liszt took the matter in hand, and the monument was completed at his expense, and unveiled at a musical festival conducted by Spohr and himself in 1845. In 1848 he settled at Weimar with Princess Sayn-Wittgenstein (d. 1887), and remained there till 1861. During this period he acted as conductor at court concerts and on special occasions at the theatre, gave lessons to a number of pianists, wrote articles of permanent value on certain works of Berlioz and the early operas of Wagner, and produced those orchestral and choral pieces upon which his reputation as a composer mainly depends. His ambition to found a school of pianists met with complete success on the one hand and partial failure on the other. His efforts on behalf of Wagner, who was then an exile in Switzerland, culminated in the first performance of Lohengrin on the 28th of August 1850, before a special audience assembled from far and near. Among the works produced for the first time or rehearsed with a view to the furtherance of musical art were
Wagner's Tannhäuser, Der fliegende Holländer, Das Liebesmahl der Apostel, and Eine Faust Overture, Berlioz's Benvenuto Cellini, the Symphonie Fantastique, Harold en Italie, Romeo et Juliette, La Damnation de Faust, and L'Enfance du Christ—the last two conducted by the composer—Schumann's Genovea, Paradise and the Peri, the music to Manfred and to Faust, Weber's Euryanthe, Schubert's Alfonso et Estrella, Raiff's König Alfred, Cornelius's Der Barbier von Bagdad and many more. It was Liszt's habit to recommend novelties to the public by explanatory articles or essays, which were written in French (some for the Journal des débats and the Gazette musicale of Paris) and translated for the journals of Weimar and Leipzig—thus his two masterpieces of sympathetic criticism, the essays Lohengrin et Tannhäuser à Weimar and Harold en Italie, found many readers and proved very effective. They are now included, together with articles on Schumann and Schubert, and the elaborate and rather high-flown essays on Chopin and Des Bohémiens et de leur musique en Hongrie (the latter certainly, and the former probably, written in collaboration with Madame de Wittgenstein), in his Gesammelte Schriften (6 vols., Leipzig). The compositions belonging to the period of his residence at Weimar comprise two pianoforte concertos, in E flat and in A, the "Todtentanz," the "Concerto pathétique" for two pianos, the solo sonata "An Robert Schumann," sung by "Totentanz," the "Totentanz," the "Rhapsodies Hongroises," twelve symphonic poems, "A Faust Symphony," "Eine Faust Symphonie," and "Eine Symphonie de Dante's 'Divina Commedia,' " the "13th Psalm" for tenor solo, chorus and orchestra, the choruses to Herder's dramatic scenes "Prometheus," and the "Missa solennis" known as the "Grazer Fest Messes." Liszt retired to Rome in 1861, and joined the Franciscan order in 1865. From 1869 onwards Abbe Liszt divided his time between Rome and Weimar, where during the summer months he received pupils—gratis as formerly—and, from 1875 up to his death at Bayreuth on the 31st of July 1886, he also taught for several months every year at the Hungarian Conservatoire of Budapest.

About Liszt's pianoforte technique in general it may be said that it derives its efficiency from the teaching of Czerny, who brought up his pupil on Mozart, a little Bach and Beethoven, a good deal of Clementi and Hummel, and a good deal of his (Czerny's) own work. Classicism in the shape of solid, respectable Hummel on the one hand, and Carl Czerny, a trifle flippant, perhaps, and inclined to appeal to the gallery, on the other, gave the musical parentage of young Liszt. Then appears the Parisian Incroyable and grand seigneur—"Monseur Lits," as the Parisians called him. Later, we find him imitating Pagani. In the course of time making a real composition and deep study of Beethoven, Weber, Schubert, Berlioz. Thus gradually was formed the master of style—whose command of the instrument was supreme, and who played like an inspired poet. Liszt's strange musical nature was long in maturing its fruits. At the pianoforte his achievements culminate in the two books of studies, twice rewritten, and finally published in 1852 as Études d'exécution transcendante, the Études de concert, and the Paganini Studies; the two concertos and the Todtentanz, the Sonata in B minor, the Hungarian Rhapsodies and the fine transcriptions of Beethoven's symphonies (the 9th for two pianoforte as well as solo), and of Berlioz's Symphonie fantastique, and the symphony, Harold en Italie. In his orchestral pieces of Liszt appears—next to Berlioz—as the most conspicuous and most thorough-going representative of programmatic music, i.e. instrumental music expressly contrived to illustrate in detail some musical or some succession of ideas or pictures. It was Liszt's aim to bring about a direct alliance or amalgamation of instrumental music with poetry. To effect this he made use of the means of musical expression for purposes of illustration, and relied on points of support outside the pale of music proper. There is always danger of failure when an attempt is thus made to connect instrumental music with conceptions not in themselves musical, for the order of the ideas that serve as a programme is apt to interfere with the order which the musical exposition naturally assumes—and the result in most cases is but an amalgam of irreconcilable materials. In pieces such as Liszt's "Poesies symphoniques," Ce qu'on entend sur la montagne (1848-1856), after a poem by Victor Hugo, and Die Ideale (1853-1857), after a poem by Schiller, the hearer is bewildered by a series of startling orchestral effects which succeed one another apparently without rhyme or reason. The music does not conform to any sufficiently definite musical plan—it is hardly intelligible as music without reference to the programme. Liszt's masterpiece in orchestral music is the Dante Symphony (1847-1855), the subject of which was particularly well suited to his temperament, and offered good chances for the display of his peculiar powers as a master of instrumental effect. By the side of it ranks the Faust Symphony (1854-1857), in which the moods of Goethe's characters—Faust, Gretchen and Mephistopheles—are depicted in three instrumental movements, with a chorus of male voices, supplying a kind of commentary, by way of close. The method of presentation in both symphonies is by means of representative themes (Leitmotive), and their combination and interaction. Incidents of the poem or the play are illustrated or alluded to as may be convenient, and the exigencies of musical form are the unfettered dictation of inspiration, and special conditions of orchestral effect.

Of the twelve Poesies symphoniques, Orphée is the only one consistent from a musical point of view, and is exquisitely scored. Melodious, effective, readily intelligible, with a dash of the commonplace, Les Préludes, Tasso, Mazepa and Fest-Klage bid for popularity. In these pieces, as in almost every production of his, in lieu of melody Liszt offers fragments of melody—touching and beautiful, it may be, or passionate, or tinged with triviality; in lieu of a rational distribution of centres of harmony in accordance with some definite plan, he presents clever combinations of chords and ingenious modulations from point to point; in lieu of musical logic and consistency of design, he is content with rhapsodical improvisation. The power of persistance seems wanting. The musical growth is spoilt, the development of the themes is stopped, or prevented, by some reference to extraneous ideas. Everywhere the programme stands in the way. In much of Liszt's vocal music, particularly in the songs and choral pieces written to German words, an annoying discrepancy is felt to exist between the true sound of the words and the musical accents. The music is generally emotional, the expression direct and passionate; there is no lack of melodic charm and originality, yet the total effect is frequently disfigured. Liszt's orchestral effects, and in the oratorios Die Heiligen Elisabeth und Christus, the rarity of fugal polyphony acts as a drawback. It almost complete absence in some of these works makes for monotony and produces a sense of dullness, which may not be inherent in all the details of the music, but is none the less distinctly present.

Omitting trilles and all publications that have been cancelled, the following list of compositions taken as being fairly comprehensive:

**Pianoforte Pieces.**—Études d'exécution transcendante; Études de concert; Zwei Studien, Walserauschen, Gnomewatz; Ab Irato; Paganini Studies; Andante con Schumann; 3 caprices, etc. Harmonies poétiques et religieuses, 1-10; Consolations, 1-6; Ave Maria in E; Sonata in B minor; Konzert-Solo in E minor; Scherzo und Marsch; Ballades, I. II.; Polonaises, I. II.; Apparitions, 1-3; Berceuse; Valse-Slow-Chor; Marscapone; 3 Caprices, etc. Galop chromatique; Mephisto-Waltzer; I, II., III. and Polka; Zwei Legenden; Die Vogelfreund; Der heilige Francis in auf einen Wagen schreitend; Der Weihnachtsbaum; 1-12; Sarabande und Chaconne ('Almira'); Legatges, I., II. and III.; La lugubre Gondola; Den Anden; Roman; Harmonie poétique; obliques; Valse-obliques, 1-3; Liebesträume, 1-3 (originally songs); Hexameron; Rhapsodies Hongroises, 1-18.

**Pianos for Two Pianos.**—Concerto pathétique (identical with the Konzert-Solo in E minor); Dante symphony; Poesies symphoniques, 1-12; Beethoven's 9th symphony.

**Pianoforte with Orchestra.**—Concertos I. in E flat, II. in A; Todtentanz; Fantaisie ueber Motiv aus Beethovens "Rurken von Arben"; Fantasie uber Ungarische National Schen; Schubert's Fantasie in C; Weber's Polacca in E.
LITANY

Fantaisies de Concert for Piano Solo.—Don Juan; Norma; Sonnambula; I Puritani; Lucia, I., II.; Lucrezia, I., II.; La Juive; Robert le Diable; Les Huguenots; Le Prophète, I–4. Paraphrases, Aufer, Tarantella di brava (Masaniello); Verdi, Rigoletto, Ernani, II Tarantella; Béatrice; La Fille du Rerain; Nabucco; Giovanna; Valse de Faust, Les Adieux de Roméo et Juliette; Tschaikowsky, Polonaise; Dargomijsky, Tarantelle; Cui, Tarantella; Saint-Saëns, Danse macabre; Schubert, Sérénades de Vienne, vælgesen i 9. Transcriptions.—Beethoven’s Nine Symphonies; Berlioz’s “Symphonie fantastique,” “Harold in Italy”; Bénédictin et Serment (Bvenemuto Cellini); Danse des Syphons (Damnation de Faust); Weber, Oberon; Beethoven’s and Hummel’s Septets; Schubert’s Divertissement à la Hongroise; Beethoven’s Concertos in C minor, G and E flat (orchestra for a second piano); Wagner’s Tannhäuser overture, murgery of Berg, Khoren; Lohengrin, Festzug and Burlesk, Elsa’s Bautgang, Elsa’s Traum, Lohengrin’s Vorweiss an Elsa; Flower Holländer, Spinnlled; Rienzi, Gebet; Rheingold, Walthall; Meistersinger, “Am stillen Herd”; Tristan, Isolde’s Liebestod; Chopin’s six Chants Polonais; Meyerbeer’s Schillermes; Bach’s six organ Preludes and Fugues; Preludes and Fugue in G minor; Beethoven, Adelaide; 6 miscellaneous and 6 Geistliche Lieder; Liederkreis; Rossini’s Les Soirées musicales, Schubert, 59 songs; Schumann, 13 songs; Mendelssohn, 8 songs; Robert Franz, 13 songs.

Organ Pieces.—Missa pro organo; Fantasia and Fugue, “Ad nos, ad salutarem undam”; B-A-C-H Fugue; Variations on Bach’s Bach; Bach’s Fughetta; Kuhnau’s Koch Fugue, “Ich habe viel Bekümmerniss”; Bach’s Choral Fugue, “Lob und Ehr”; Nicolai’s Kirchliche Festouvertüre, “Ein fest borg” Allegri’s Miserere; Mozart’s Ave Verum; Arcadelt’s Ave Maria; Lassus’s L’Homme armé.

Variations.—Leopoldun; *Le Monde des Songes*; Missa rote der Heiligen Elisabeth; “Christus”; Stanislaus (unfinished). Masses: Missa solennis for the inauguration of the cathedral at Grün; Ungarische Krönungs-messe; Missa choralis (with organ); Missa and Requiem for male voices (with organ); Psalms, 13, 17, 23 and 18; 12 Kirchen-Chor-Gesänge (with organ). Cantatas: Prometheus-chör; “Beethoven Cantata”; “An die Künstler”; Die Glänsen des Straßburg-Münsters; 12 Chöre für Männersgesang, Songs, 8 beboccas, Stimmungsmusik, etc., au bebeau.

Mélodramatique Pieces for Declaration, with Pianoforte Accompaniment.—Leonore (Bürger); Der treue Mönch (Lenau); Des todten Dichter’s Liebe (Jokail); Der blinde Singer (Tolstoy).

Ecclesiastic Pieces.—La Passion; Lassus’s Concert de Concert et Sonatas; Schubert Fantasia, 4 Sonatas, Improptus, Valses and Moments musicaux.

See also L. Ramaun, Fr. Litz as Künstler und Mensch (1880–1894); E. Dannebürger, Oxford Hist. of Music, vol. VI (1905).

LITANY.

This word (Aurelia), like ärøy (both from Xeioa), is used by Eusebius and Chrysostom, commonly in the plural, in a general sense, to denote a prayer or prayers of any sort, whether public or private; it is similarly employed in the law of Arcadius (Cod. Theod. xvi. tit. 5. leg. 50), which forbids heretics to hold assemblies in the city “ad litaniam laciandam.” But some trace of a more technical meaning is found in the epistle (Ep. 63) of Basil to the church of Neoacarea, in which he argues, against those who were objecting to certain innovations, that neither were “litaniés” used in the time of Gregory Thaumaturgus.

The nature of the recently introduced litanies, which must be assumed to have been originated in the city of Rome, cannot be conjectured; probably they had many points in common with the “rogationes,” which, according to Sidonius Apollinaris, had been coming into occasional use in France about the beginning of the 5th century, especially when rain or fine weather was desired, and, so far as the three fast days before Ascension were concerned, were fixed, for one particular district at least, by Mamertus or Marmuricus of Vienne (A.D. c. 450).

We gather that they were penitential and intercessory prayers offered by the community while going about in procession, fasting and clothed in sackcloth. In the following century the manner of making litanies was to some extent regulated for the entire Eastern empire by one of the Novels of Justinian, which forbade their celebration without the presence of the bishops and clergy, and ordered that the crosses which were carried in procession should not be deposited elsewhere than in churches, nor be carried by any but duly appointed persons. The first synod of Orleans (A.D. 511) enjoins for all Gaul that the “litaniés” before Ascension be celebrated for three days; on these days all menials are to be exempt from work, so that every one may be free to attend divine service. The diet is to be the same as in Qu Begesima; clerks not observing these rogations are to be punished by the bishop. In A.D. 517 the synod of Gerunda provided for two sets of “litaniés”; the first were to be observed for three days (from Thursday to Saturday) in the week after Pentecost with fasting, the second for three days from November 1. The second council of Vaison (529), consisting of twelve bishops, ordered the kyrie eleison—now first introduced from the Eastern Church—to be sung at matins, mass and vespers.

A synod of Paris (573) ordered litanies to be held for three days at the beginning of Lent, and the fifth synod of Toledo (636) appointed litanies to be observed throughout the kingdom for three days from December 14. The first mention of the word litiy in connexion with the Roman Church goes back to the pontificate of Pelagius I. (555), but implies that the thing was at that time already old. In 590 Gregory I., moved by the pestilence which had followed an inaudition, ordered a “litania septiformis,” sometimes called litania major, that is to say, a sevenfold procession of clergy, laity, monks, virgins, matrons, widows, poor and children. It must not be confused with the litaniæ septimae used in church on Easter Even. He is said also to have appointed the processions or litanies of April 25 (7 St Mark’s day), which seem to have come in the place of the ceremonies of the old Regalia. In 517 the synod of Cloveshoe ordered the litanies or rogations to be gone about on April 25 “after the manner of the Roman Church,” and on the three days before Ascension “after the manner of our ancestors.” The latter are still known in the English Church as Rogation Days. Games, horse racing, junketings were forbidden; and in the litanies the name of Augustine was to be inserted after that of Gregory. The reforming synod of Mainz in 813 ordered the major litanies to be observed by all for three days in sackcloth and ashes, and barefoot. The sick only were exempted.

As regards the form of words prescribed for use in these “litaniés” or “supplications,” documentary evidence is defective. Sometimes it would appear that the “procession” or “litany did nothing else but chant Kyrie eleison without variation. There is no reason to doubt that from an early period the same words in various churches all had the common features which are now regarded as essential to a litany, in as far as they consisted of (1) invocations, (2) deprecations, (3) intercessions, (4) supplications. But in details they must have varied immensely.

The offices of the Roman Catholic Church at present recognize two litanies, the “Litaniae majores” and the “Litaniae breves,” which differ from one another chiefly in respect of the fullness with which details are entered upon under the heads mentioned above. It is said that in the time of Charlemagne the angels Orihel, Raguel, Tobiel were invoked, but the names were removed by Pope Zacharias as really belonging to demons. In some medieval litanies there were special invocations of S. Fides, S. Spes, S. Charitas. The litanies, as given in the Breviary, are at present required to be recited on bended knee, along with the penitential psalms, in all churches. At Mass the recitation of these litanies is optional. Without the psalms they are said on the feast of Saint Mark and on the three rogation days. A litany is chanted in procession before mass on Holy Saturday. The “litany” or “general supplication” of the Church of England, which is appointed “to be sung or said after morning prayer upon Sundays, Wednesdays and Fridays, and at other times when it shall be commanded by the ordinary,” closely follows the “Litaniae majores” of the Breviary, the invocations of saints being of course omitted. A similar German litany will be found in the works of Luther.
In the Roman Church there are a number of special litanies peculiar to particular localities or orders, such as the "Litanies of Mary" or the "Litanies of the Sacred Name of Jesus." There was originally a close connexion between the litany and the liturgy. The ninefold Kyrie eleison at the beginning of the Roman Mass is a relic of a longer litany of which a specimen may still be seen in the Stowe missal. In the Ambrosian liturgy, the threefold Kyrie eleison or Lesser Litany occurs thrice, after the Gloria in excelsis, after the gospel and at the end of Mass; and on the first five Sundays in Lent a missal litany is placed before the Oratio super populum, and on the same five Sundays in the Mozarabic rite before the epistle. In Eastern liturgies litanies are a prominent feature, as in the case of the deacon's litany at the beginning of the Missa fidelis in the Clementine liturgy, immediately before the Anaphora in the Greek liturgy of St James, &c.

**LITCHFIELD**, a township and the county-seat of Litchfield county, Connecticut, U.S.A., about 28 m. 6 ft. from Hartford, and including the borough of the same name. Pop. of the township (1800) 3204; (1805) 3214; (1810) 3005; of the borough (1800) 1058; (1805) 1120; (1810) 903. Area of the township, 48-6 sq. m. The borough is served by the New York, New Haven & Hartford railroad. It is situated on elevated land, and is one of the most attractive of southern New England summer resorts. The principal elevation in the township is Mt. Prospect, at the base of which there is a vein of pyrrhotite, with small quantities of nickel and copper. On the southern border of the borough is Lake Bantam (about 900 acres, the largest lake in the state) whose falls, at its outlet, provide water power for factories of carriages and electrical appliances. Dairying is the most important industry, and in 1869 the county ranked first among the counties of the state in the value of its dairy products—$1,373,057, from 3465 farms, the value of the products of the entire state being $7,095,005.

The landowners in the township of Litchfield (originally called Bantam) were bought from the Indians in 1715-1716 for £15, the Indians reserving a certain part for hunting. The township was incorporated in 1719, was named Litchfield, after Litchfield in England, and was settled by immigrants from Hartford, Windsor, Wethersfield, Farmington and Lebanon (all within the state) in 1720-1721. In 1791 it became the county-seat of Litchfield county, and at the same time the borough of Litchfield (incorporated in 1879) was laid out. From 1776 to 1780 two depôts for military stores and a workshop for the Continental army were maintained, and the leaden statue of George III., erected in Bowling Green, New York City, in 1770, and torn down by citizens on the 6th of July 1776, was cut up and taken to Litchfield, where, in the house (still standing) of Oliver Wolcott it was melted into bullets for the American army by Wolcott's daughter and sister. Aaron Burr, whose only sister, Tapping Reeve (1744-1823), lived in Litchfield with Reeve in 1774-1775. In 1780 Reeve established here the Litchfield Law School, the first of its kind in America. In 1788 he associated himself with James Gould (1755-1848), who, after Reeve's retirement in 1826, continued the work, with the assistance of Jabez W. Huntington (1788-1847), until 1833. The school was never incorporated, it had no buildings, and the lectures were delivered in the law offices of its instructors, but among its 1000 or more students were many who afterwards became famous, including John C. Calhoun; Levi Woodbury (1790-1851), United States senator from New Hampshire in 1825-1831 and in 1841-1845, secretary of the navy in 1831-1834 and of the treasury in 1834-1841, and a justice of the United States Supreme Court from 1845; John Y. Mason; John M. Clayton; and Henry Baldwin (1780-1844), a justice of the United States Supreme Court from 1836. In 1892 Mrs Sarah Pierce made one of the first efforts toward the higher education of women in the United States; by opening in Litchfield her Female Seminary, which had an influential career of about forty years, and numbered among its alumnæ Harriet Beecher Stowe, Mrs Marshall O. Roberts, Mrs Cyrus W. Field and Mrs Hugh McCulloch. Litchfield was the birthplace of Ethan Allen; of Henry Ward Beecher; of Harriet Beecher Stowe, whose novel, *Poganuc People*, presents a picture of social conditions in Litchfield during her girlhood; of Oliver Wolcott, Jr. (1765-1833); of John Pierpoint (1785-1866), the poet, preacher and lecturer; and of Charles Loring Brace, the philanthropist. It was also the home, during his last years, of Oliver Wolcott (1726-1792); of Colonel Benjamin Tallmadge (1774-1835), an officer on the American side in the War of Independence and later (from 1805 to 1817) a Federalist member of Congress; and of Lyman Beecher, who was pastor of the First Congregational church of Litchfield from 1810 to 1826.

**LITCHFIELD**, a city of Montgomery county, Illinois, U. S. A., about 50 m. N.E. of St Louis, Missouri. Pop. (1900) 5188; (1910) 5971. Its principal importance is as a railway and manufacturing centre; it is served by the Chicago, Burlington & Quincy, the Chicago & Alton, the Cleveland, Cincinnati, Chicago & St Louis, the Illinois Central, the Western, and the Litchfield & Madison railways, and by electric lines connecting with St Louis and the neighbouring towns. In the vicinity are deposits of bituminous coal, fire-clay and moulding sand. There are various manufactures in the city. Litchfield was incorporated as a town in 1856, and was first chartered as a city in 1859.

**LITCHI**, or LEE-CHEE, the fruit of *Nephelium Litchi*, a small tree, native of southern China and one of the most important indigenous fruits. It is also cultivated in India. The tree bears large compound leaves with two to four pairs of leathery lanceolate pointed leaflets about 3 in. long, and panicles of small flowers without petals. The fruits are commonly roundish, about 1½ in. in diameter, with a thin, brittle, red shell which bears rough protuberances. In the fresh state they are filled with a sweet white pulp which envelops a large brown seed, but in the dried condition the pulp forms a blackish fleshy substance. The pulp is of the nature of an aril, that is, an additional seed-coat.

*Nephelium Longana*, the longan tree, also a native of southern China, is cultivated in that country, in the Malay Peninsula, India and Ceylon for its fruit, which is smaller than that of the litchi, being half an inch to an inch in diameter with a nearly smooth yellow-brown brittle skin, and containing a pulpy aril resembling that of the litchi in favour. Another species, *N. lappaceum*, a tall tree native of the Malay Peninsula, whose name is known under the names Rambutan or Ramboesteen, is also cultivated for its pleasantly acid pulpy aril. The fruit is oval, bright red in colour, about 2 in. long and covered with long fleshy hairs.

*Nephelium* belongs to the natural order Sapindaceae, and contains about twenty-two species.

**LITERATURE**, a general term which, in default of precise definition, may stand for the best expression of the best thought reduced to writing. Its various forms are the result of race peculiarities, or of diverse individual temperaments, or of political circumstances securing the predominance of one social class which is thus enabled to propagate its ideas and sentiments. In early stages of society, the classes which first attain a distinct literary utterance are priests who compile the chronicles of tribal religious development, or rhapsodes who celebrate the prowess of tribal chiefs. As man feels before he reasons, so poetry generally precedes prose. It embodies more poignantly the sentiment of unsophisticated man. Hence sacred books and war-songs are everywhere the earliest literary monuments, and both are essentially poetic compositions which have received a religious or quasi-religious sanction. The recitation of the Homeric poems at the Panathenaea corresponds to the recitation elsewhere of the sacred texts in the temple; the statement of Phemius (*Odyssey*, xxii. 347) that a god inspired his soul with all the varied ways of so long threatened the oratory; Emily's early historical tales. Verses of the sacred chronicles, or fragments of epic poems, were learned by heart and supplied a standard of popular literary taste. The public declamation of long chosen passages by priests, and still more by contending rhapsodes, served to evoke the
latent sense of literary criticism; and, at a later stage, the critical spirit was still further stimulated by the performance of dramatic pieces written by competing poets. The epic record of the past was supplemented by the lyrical record of contemporary events, and as the Homeric poets had immortalized the siege of Troy, so Pindar commemorated Salamis. Prose of any permanent value would first show itself in the form of oratory, and the insertion of speeches by early historians indicates a connexion with rhetoric. The development of abstract reasoning would tend to deprive prose of its superfluous ornament and to provide a simpler and more accurate instrument.

No new genre has been invented since the days of Plato. The evolution of literature is completed in Greece, and there its subdivisions may best be studied. Epic poetry is represented by the Homeric cycle, lyrical poetry by Tyrtaeus, dramatic poetry by Aeschylus, history by Herodotus, oratory by Pericles, philosophy by Plato, and criticism by Zolus, the earliest of slashing reviewers; and in each department there is a long succession of illustrious names. Roughly speaking, all subsequent literature is imitative. Ennius transplanted Greek methods to Rome; in his contemporary L. Fabius Pictor, the earliest Roman historian, wrote in Greek; and many Roman poets from Lucretius to Horace abounded in imitations of Greek originals. The official adoption of Christianity as the state religion changed the spirit of literature, which became more and more provincial after the downfall of the empire. Literature did not perish during the “dark ages” which extend from the sixth century to the beginning of the 11th, but it was subordinate to scholarship. The dissolution of Latin was not complete till about the middle of the 9th century, and the new varieties of Romance did not become ripe for literary purposes till a hundred years later. Meanwhile, not a single literary masterpiece was produced in western Europe for five centuries; by comparison only do Boethius and Venantius Fortunatus seem to be luminous points in the prolonged night; the promise of a literary renaissance at the court of Charlemagne was unfilled, and the task of creating a new literature devolved upon the descendants of the barbarians who had destroyed the old. The Celtic and Teutonic races elaborated literary methods of their own; but the fact that the most popular form of Irish verse is adopted from Latin prosody is conclusive evidence that the influence of Roman—and therefore of Greek—models persisted in the literature of the outlying provinces which had attained political independence. The real service rendered to literature by the provincials lay in the introduction and diffusion of legends freighted with a burden of mystery which had disappeared with Pan, and these new valuable materials went to form the substance of the new poetry.

The home of modern European literature must be sought in France, which assimilated the best elements in Celtic and Teutonic literature. From the 11th to the 14th century, France was the centre of intellectual life in Europe, as Greece and Rome had been before, and as Italy was to be afterwards. The *chansons de geste*, inspired by the sense of patriotism and the yearning for religious unity, inculcate feudal and Catholic doctrine, and as society in the western world was universally committed to feudalism and Catholicism, these literary expressions of both theories were widely accepted, and copied. The Germanic origin of the French epic is long lost sight of, and imitators are attracted by the French execution, and by the creative power of the *chansons de geste*. Again, France takes the stories of the Arthurian court from Welsh texts or from the lips of Welsh settlers, handles the romantic element, and, through Marie de France and Chrétien de Troyes, imparts to the whole a touch of personal artistry which is absent from the *chansons de geste*. The *matière de Bretagne* goes forth to Italy, Germany and England—later to Portugal and Spain—bearing the imprint of the French genius. Thus France internationalizes local subjects, and first assumes a literary function which, with few interruptions, she has since discharged. She further gives to Europe models of allegory in the *Roman de la rose*, founds the school of modern history through Villehardouin, inaugurates the religious drama and the secular theatre. She never again dominated the literatures of Europe so absolutely.

The literary sceptre passed from France to Italy during the 14th century. Brunetto Latini, who wrote in French as well as in Italian, is the connecting link between the literatures of the two countries; but Italy owes its eminence not so much to a general diffusion of literary accomplishment as to the emergence of three great personalities. Dante, Boccaccio and Petrarch created a new art of poetry and of prose. England yielded to the fascination in the person of Chaucer, Spain in the person of her chancellor López de Ayala, and France in the person of Charles d’Orléans, the son of an Italian mother. Petrarch, once ambassador to Italy, alleged that there were no poets out of Italy, and indeed there were no living poets to compare with him elsewhere. But in all countries he raised up rivals—Chaucer, Marot, Garcilaso de la Vega—and Sannazaro did a century and a half later. Sannazzaro’s *Aradia* captured the Portuguese Monemöör, whose pastoral novel the *Divina*, written in Spanish, inspired d’Urfe no less than Sidney, and, as d’Urfe’s *Astére* is considered the starting-point of the modern French novel, the historical importance of the Italian original cannot be exaggerated.

Spain never produced any intellectual movement corresponding to that exercised by France and Italy, or to her political authority during the 16th and 17th centuries. This may be attributed partly to her geographical position which lies off the main roads of Europe, and partly to the fact that her literature is essentially local. Cervantes, indeed, may be said to have influenced all subsequent writers of fiction, and the influence of Spanish literature is visible in the body of European picaresque tales; but, apart from Corneille and a few other dramatists who preceded Molière in France, and apart from the Restoration drama in England, the influence of the Spanish drama was relatively small. In some respects it was too original to be imitated with success. Much the same may be said of England as of Spain. Like Spain, she lies outside the sphere of continental influence; like Spain, she has innumerable great names in every province of literature, and, in both cases, to Europe at large these long remained names and nothing more; but Spain, she is prone to reproduce borrowed materials in shapes so transformed and rigid as to be unrecognizable and unadaptable. Moreover, the Reformation isolated England from literary commerce with the Latin races, and till the 18th century Germany was little more than a geographical expression. Even when Germany recovered her literary independence, Lessing first translated Shakespeare through Voltaire. Neither Shakespeare nor Milton was read in France before the 18th century—the first translated by Ducis, the second by Dupré de Saint-Maur—and they were read with curiosity rather than with rapture. On the other hand, Boileau, Rapin and Le Bossu were regarded as oracles in England, and through them French literature produced the “correctness” of Queen Anne’s reign. Horace Walpole is half a Frenchman, Hume imitates Montesquieu’s cold lucidity, Gibbon adapts Bossuet’s majestic periods to other purposes. On the other hand Voltaire takes ideas from Locke, but his form is always intensely personal and inimitably French. After the 16th century English literature, as a whole, is refractory to external influence. Waves of enthusiasm pass over England—for Shakespeare, for Goethe—but leave no abiding trace on English literature. During the latter half of the 18th century France resumed something of her old literary supremacy; the literatures of Italy and Spain at this period are purely derivative, and French influence was extended still further on the continent as the result of the Romantic movement. Since that impulse was exhausted, literature everywhere has been in a state of flux: it is less national, and yet fails to be cosmopolitan. All writers of importance, and many of no importance, are translated into other European languages; the quick succession of diverse and violent impressions has confused the scheme of literature. Literature suffers likewise from the competition of the newspaper press, and as the press has multiplied it has grown less literary. The diversities of modern interests, the want of leisure for concentrated thought, suggest that literature
may become once more the pleasure of a small ceste. But the desire for the one just form which always inspires the literary artist visits most men sometimes, and it cannot be doubted that literature will continue to accommodate itself to new conditions.

LITERNUM, an ancient town of Campania, Italy, on the low sandy coast between Cumae and the mouth of the Volturinus. It was probably once dependent on Cumae. In 104 B.C. it became a Roman colony. It is mainly famous as the residence of the elder Scipio, who withdrew from Rome and died here. His tomb and villa are described by Seneca. Augustus is said to have conducted here a colony of veterans, but the place never had any great importance, and the lagoons behind it made it unhealthy, though the construction of the Via Domitiana through it must have made it a posting station. It ceased to exist in the 5th century.

No remains are visible.

See J. Beloch, Campanien, ed. ii. (Breslau, 1890), 377.

LITHGOW, William (1582-1650), Scottish traveller and writer, was born and educated in Lanark. He was caught in a love-adventure, mutilated of his ears by the brothers of the lady (hence the sobriquet "Cut-lugged Willie"), and forced to leave Scotland. For nineteen years he travelled, mostly on foot, through Europe, the Levant, Egypt and northern Africa, covering, according to his estimate, over 30,000 m. The story of his adventures may be drawn from The Totall Discourse of the Rare Adventures and Painfull Perjuries of long nineteenth Years (London, 1614; fuller edition, 1632, &c.); A True and Experientiall Discourse upon the last siege of Breda (London, 1637); and a similar book giving an account of the siege of Newcastle and the battle of Marston Moor (Edinburgh, 1645). He is the author of a Present Surveigh of London (London, 1643). He left six poems, written between 1618 and 1640 (reprinted by Malden, Edinburgh, 1863). Of these "Scotland's Welcome to King Charles, 1639" has considerable antiquarian interest. His writing has no literary merit; but its excessively aureate style deserves notice.

The best account of Lithgow and his works is by F. Hindes Groome in the Dict. Nat. Biog. The piece entitled Scotland's Parneseness to King Charles II. (1660), ascribed to him in the catalogue of the Advocates' Library, Edinburgh, cannot, from internal evidence, be his.

LITHGOW, a town of Cook county, New South Wales, Australia, 66 m. W.N.W. of Sydney by rail. Pop. (1901) 3568. The town is situated at an altitude of 3000 ft., in a valley of the Blue Mountains. It has pottery and terra-cotta works, breweries, a tweed factory, iron-works, saw-mills, soap-works and brickfields. Coal, kerosene shale, iron ore and building stone are found in the district.

LITHIUM [symbol Li, atomic weight 7-00 (O = 16)], an alkali metal, discovered in 1817 by J. A. Arfwedson (Ann. chim. phys., ro, p. 82). It is only found in combination, and is a constituent of the minerals petalite, tripylite, spodumene and lepidolite or lithia mica. It occurs in small quantities in sea, river and spring water, and is also widely but very sparingly distributed through the geologic globe. It may be obtained (in the form of its chloride) by fusing lepidolite with a mixture of barium carbonate and sulphate, and potassium sulphate (L. Troost, Comptes rendus, 1856, 43, p. 921). The fused mass separates into two layers, the upper of which contains a mixture of potassium and lithium sulphates; this is liquified with water and converted into the mixed chlorides by adding barium chloride, the solution evaporated and the lithium chloride extracted by a mixture of dry alcohol and ether. The metal may be obtained by heating dry lithium hydroxide with magnesium (H. N. Warren, Chem. News, 1866, 74, p. 6). L. Kahlenberg (Jour. phys. Chem., 3, p. 601) obtained it by electrolysis of the chloride in pyridine solution, a carbon anode and an iron or platinum cathode being used. O. Ruff and O. Johannesen (Zeit. electrochem., 1906, 55, p. 337) electrolyse a mixture of brome and chloroide which melts at 520°. It is a soft, silvery-

white metal, which readily tarnishes on exposure. Its specific gravity is 0.50, and it melts at 180° C. It burns on ignition in air, and when strongly heated in an atmosphere of nitrogen it forms lithium nitride, Li₃N. It decomposes water at ordinary temperature, liberating hydrogen and forming lithium hydroxide.

Lithium hydride, LiH, obtained by heating the metal in a current of hydrogen at a red heat, or by heating the metal with ethylene to 700° C. (M. Guntz, Comptes rendus, 1896, 122, p. 244; 123, p. 1273), is a white solid which inflames when heated in chlorine. With alkali metals it forms lithium compounds closely allied to those of sodium. Lithium oxide, Li₂O, is obtained by burning the metal in oxygen, or by ignition of the nitrate. It is a white powder which readily dissolves in water to form the hydroxide, LiOH, which is almost water-white. Its solution is bleached by boiling with sodium carbonate and forms a white caustic mass, resembling sodium hydroxide in appearance. It absorbs carbon dioxide, but is not deliquescent. Lithium chloride, LiCl, prepared by heating the metal in chlorine, or by dissolving the oxide or carbonate in hydrochloric acid, is exceedingly deliquescent, melts below a red heat, and is very soluble in alcohol. Lithium carbonate, Li₂CO₃, obtained as a white amorphous precipitate, by adding sodium carbonate to a solution of lithium chloride, is sparingly soluble in water. Lithium hydroxide, LiOH, is formed by boiling with sodium hydroxide and resembles sodium hydroxide in many of its properties. Lithium chloride, LiCl, obtained by heating lithium carbonate and carbon in the electric furnace, forms a transparent crystalline mass of specific gravity 1.65, and is readily decomposed by boiling water giving acetylene (H. Groome, ibid., 1896, 122, p. 362). Lithium is also detected by a faint yellow line of wave-length 6104 and the bright red line of wave-length 6708, shown in its flame spectrum. It may be distinguished from sodium and potassium by the sparing solubility of its carbonate and phosphate. The atomic weight of lithium was determined by a combination of the analysis of the chloride, and also by the analysis of the chloride into the nitrate, the value obtained being 7-03 (O = 16).

The preparations of lithium used in medicine are: Lithii Carbonis, doses 5 to 10 gr.; Lithii Citalis, doses 5 to 10 gr.; and Lithii Citalis effervescens, a mixture of citric acid, lithium citrate, tartaric acid and sodium bicarbonate, dose 60 to 120 grs. Lithium salts render the urine alkaline and are in virtue of their action diuretic. They are much more powerfully active in acid or chronic gout, and as a solvent or uric acid calculi or gravel, but their action as a solvent of uric acid has been certainly overrated, as it has been shown that the addition of medicinal doses of lithium to the blood serum does not increase the solubility of uric acid. Lithium salts are used in the treatment of acute and chronic uric acid gout, and in uricosuric diuretics. Lithium salts cause vomiting and diarrhoea, due to a gastro-enteritis set up by their action. In medical use they should therefore be always freely diluted.

LITHOGRAPHY (Gr. Λίθος, a stone, and γράφειν, to write), the process of drawing or laying down a design or transfer, on a specially prepared stone or other suitable surface, in such a way that impressions may be taken therefrom. The principle on which lithography is based is the antagonism of grease and water. A chemically pure surface having been secured on some substance that has an equal affinity for both grease and water, in a method hereafter to be described, the principle is explained. Lithography is a means of reproducing a drawing or a written document, and the rest of the surface is moistened, so that when a greasy roller is applied, the portion which resists the grease and that in which an affinity for grease has been set up readily accepts it; and from the surface thus treated it will be seen that it is an easy thing to secure an impression on paper or other material by applying suitable pressure.

The inventor of lithography was Alois Senefelder (1771-1834); and it is remarkable what a grip he at once seemed to get of his invention, for whereas the invention of printing seems almost a matter of evolution, lithography seems to come upon the scene fully equipped for the battle of life, so that it would be a bold craftsman at the present day who would affirm that he knew more of the principles underlying his trade than Senefelder (q.v.) did within thirty years of its invention. Of course practice has led to dexterity, and the great volume of trade has induced many mechanical improvements and facilities, but the principles have not been taken any further, while some valuable methods

1. Mommsen in C.I.L. x. 243 does not accept this statement, but an inscription found in 1885 confirms it.
LITHOGRAPHY

have been allowed to fall into desuetude and would well repay some experimentially disposed person to revive.

Lithography may be divided into two main branches—that which is drawn with a greasy crayon (rather illogically called “chalk”) on a grained stone, and that which is drawn in “ink” on a polished stone. Whatever may be thought in regard to the original work of the artists of various countries who have used lithography as a means of expression, there can be little doubt that in the former method the English professional lithographer has always held the pre-eminence; while French, German and American artists have surpassed them in the latter.

Chalk lithography subdivides itself into work in which the black predominates, although it may be supported by 5 or 6 shades of modified colour—this branch is known as “black and tint” work—and that in which the black is only used locally like any other colour. Frequently this latter class of work will require a dozen or more colours, while some of the finest examples have had some twenty to thirty stones employed in them. Work of this description is known as chromo-lithography. Each colour requires a separate stone, and work of the highest quality may want two or three blues with yellows, reds, greys and browns in proportion, if it is desired to secure a result that is an approximate rendering of the original painting or drawing. The question may perhaps be asked: “If the well-known three-colour process” (see Process) “can give the full result of the artist’s palette, why shouldn’t it take so many more colours in lithography to secure the same result?” The answer is that the stone practically gives but three gradations—the solid, the half tint and the quarter tint, so that the combination of three very carefully prepared stones will give a very limited number of combinations, while a moderate estimate of the shades on a toned block would be six; so that a very simple mathematical problem will show the far greater number of combinations that the three blocks will give. Beyond this, the chromolithographer has to exercise very great powers of colour analysis; but the human mind is quite unable to settle on the exact proportion of red, blue and yellow necessary to produce some particular class say of grey, and this the camera with the aid of colour filters does with almost perfect precision.

Notwithstanding these disadvantages, lithography has these strong points: (1) its utility for small editions on account of its, at present, smaller prime cost; (2) its suitability for subjects of large size; (3) its superiorit for subjects with outlines, for in such cases the outline can be done in one colour, whereas to secure this effect by the admixture of the three colours requires marvellously good registration, the absence of which would produce a very large proportion of “waste” or faulty copies; (4) capacity for printing on almost any paper, whereas, at the time of writing, the tri-colour process is almost entirely limited to printing on coated papers that are very heavy and not very enduring.

With regard to the two branches of chalk lithography, the former maintained the English supremacy for black and tint work in the early days were Hulemandel, Day and Haghe and Maclure, while the best chromo-lithographic work in the same period was done by Vincent Brooks, the brothers Hanhart, Thomas Kell and F. Kell. In reference to the personal work of professional lithographers during the same period, the names of Louis Haghe, J. D. Harding, J. Needham, C. Baugniet, L. Gheem, William Simpson, R. J. Lane, J. H. Lynch, A. Maclure and Rimnaceous stand for black and tint work; while in chromo-lithography J. M. Carrick, C. Risdon, William Bunney, W. Long, Samuel Hodson, Edwin Buckman and J. Lewis have been conspicuous among those who have maintained the standard of their craft. In the foregoing list will be recognized the names of several who have had admirable works on the walls of the Royal Academy and other exhibitions; Mr Lane, who exhibited lithographs from 1842 to 1872, was for many years the doyen of lithographers, and the only one of their number to attain academic rank, but Lynch and John Cardwell Bacon were his pupils, and Bacon’s son, the painter John H. F. Bacon, was elected to the Royal Academy in 1903. In the first decade of the 20th century the number of firms doing high-class work, and the artists who aided them in doing it, were more numerous than ever, and scarcely less able, but it would be outside the present purpose to differentiate between them.

The raison d’être of “stipple” work is its capacity for retransferring without serious loss of quality, for it can scarcely be contended that it is as artistic as the methods just described. Retransferring is the process of pulling impressions from the original stones with a view to making up a large sheet of one or more small subjects, or where it is desired to print a very large number without deterioration of the original or matrix stone. The higher class work in this direction has been done in France, Germany and the United States, where for many years superiority has been shown in regard to the excellence and rapidity of retransferring. To this cause may be attributed the fact that the box tops and Christmas cards on the English market were so largely done abroad until quite recent times. The work of producing even a small face in the finest hand stipple is a lengthy and tedious affair, and the English craftsman has seldom shown the patience necessary for this work; but since the American invention known as Ben Day’s shading medium was introduced into England the trade has largely taken it up, and thereby much of the tedium has been avoided, so that it has been found possible by its means to introduce a freedom into stipple work that had not before been found possible, and in this a very much better class of work has since been produced in this country.

About the year 1868 grained paper was invented by Maclure, Macdonald & Co. This method consists in impressing on ordinary Scotch transfer or other suitable paper a grain closely allied to that of the lithographic stone. It appears to have been rather an improvement than a new invention, for drawing paper and even canvas had been coated previously with a material that adhered to a stone and left on the stone the greasy drawing that had been placed thereon; but this is the beautifully prepared paper that was placed on the market by the firm of which the late Andrew Maclure was the head was a great advance, and although the first use was by the ordinary craftsman it was not long before artists of eminence saw that a new and convenient mode of expression was opened up to them.

On the first introduction of lithography the artists of every nation hastened to avail themselves of it, but soon the cumbrous character of the stone, and the fact that their subjects had to be drawn backwards in order that they might appear correctly on the paper, wore down their newly-born zeal, and it was only when the grained paper system was perfected, by which they could make their drawings in the comfort of their studios without reversing, that any serious revival took place. Although excellent work on grained paper had been done by Andrew Maclure, Rimnaceous, John Cardwell Bacon, Rudofsky and other craftsmen, the credit for its furtherance among artists must be given to Thomas Way and his son T. R. Way, who did much valuable printing in this direction. The advantage of such artists of eminence as Whistler, Legros, Frank Short, Charles Shannon, Fantin Latour, William Strang, Will Rothenstein, Herbert Railton and Joseph Pennell, did not a little to aid lithography in resisting the encroachments of other methods into what may still be considered its sphere. As a means of reproducing effects which an artist would otherwise get by pencil or crayon, it remains entirely unequalled, and it is of obvious advantage to art that twenty-five or fifty copies of an original work should exist, which, without the aid of lithography, might have only been represented by a single sketch, perhaps stowed away among the possessions of one private collector.

In regard to grained paper work, undue stress has often been placed upon the rapid deterioration of the stone, some contending that only a few dozen first-class proofs can be taken; this has led to the feeling that it is unsuited to book illustration, and damage has been done to the trade of lithography thereby. It may be mentioned that quite recently about two auto-lithographs in black and three colours, the combined work of Mr and
Mrs Herbert Riallion have been treated by the Ebcole system of etching described below, and although an infinitesimal loss of quality may have arisen, such as occurs when a copper etching is steel faced, some 2000 to 3000 copies were printed without further deterioration, and an edition of vignetted sketches was secured, far in advance of anything that could have been attained from the usual screen or half-toned blocks.

Grained paper is much used in the ordinary lithographic studio for work such as the hill shading of maps that can be done without much working up, but the velvety effects that in the hands of Louis Haghe and his contemporaries were so conspicuous, cannot be secured by this method. The effects referred to were obtained by much patient work of a “tinter,” who practically laid a ground on which the more experienced and artistic craftsman did his work either by scraping or accentuation. Where fine rich blacks and other tones of grey were required by the firm carrying on the “tint” and “wash” methods described by Senefelder in his well-known treatise, and afterwards practised with great skill by Hulemandel.

Lithography is of great service in educational matters, as its use for diagrams, wall pictures and maps is very general; nor does the influence end with schooldays, for in the form of pictures at a moderate price it brings art into homes and lives that need brightening, and even in the form of posters on the much-abused hoardings does something for those who have to spend much of their time in the streets of great cities.

According to the census of 1901, 4,686 people in the United Kingdom found their occupation within the trade, while according to the London Office return (1906), 29,957 persons other than lithographic printers are employed in the printing business. As it may be assumed that an equal number are employed in France, Germany, the United States of America and the world at large, it is clear that a vast industrial army is employed in a trade that, like letterpress printing, has a very beneficial influence upon those engaged in it.

Technical Details.—The following description of the various methods of lithography is such as may be considered of interest to the general reader, but the serious student who will require formulas and more precise directions will do well to consult one of the numerous text-books on the subject.

Stone and Stone Substitutes.—The quality of stone first used by Alois Senefelder, and discovered by him at the village of Sollenhofen in the Swabian Alps, was a softish white limestone, the name of which is misleading in some respects. This stone contains a very large area and underlies the villages of Sollenhofen, Moerheim and Langenlaufheim, has often been described, sometimes for interested motives, as nearly exhausted; but a visit in 1906 revealed that the output—estimated at the current rate of 10,000 tons a year—has remained little short of a century—was very unimportant when compared to the great mass of carbonaceous limestone existing in the neighbourhood. The strong point in favour of this source of supply, in addition to its utility as the current source of supplies, is the fact that after the removal of the surface deposits, which are very thin, the stones come out of large size, in thickness of 3 to 4 in., and thus just suited for lithographic purposes and needing only to be wrought in the vertical direction. Other deposits of suitable stone have been found in France, Spain, Italy and Greece, but transit and the absence of suitable stratification have restricted them to little more than local wants. The deposits other than in the neighbourhood of Sollenhofen have been discovered at the exact depth of density necessary, and the heavier varieties do not receive the grease with sufficient readiness. The desire to find other sources of supply has led to a search through the southern part of Bavaria, for the quarries are largely owned by peasants who have very well-defined business habits of their own which make transactions difficult. Among other things, they will seldom supply the highest grades and the largest sizes to those who will not take their proportion of lower quality and smaller sizes; and this is in view of the very expensive transit down the Rhine to Rotterdam, with a railway journey at one end and a sea journey at the other, is a source of expense.

The earliest substitute for lithographic stone was zinc, which has been used from early days and is now more in demand than ever; it requires very careful printing as the grease only penetrates the metal to a very slight extent, and the same must be said in regard to the water mark. Whether the current zinc trouble is likely to arise; and when this has occurred, remedial methods are much more difficult than with stones. When put away for storage, a dry place is very essential, as corrosion is easily set up. At first the plates were quite thick, and almost invariably grained by a zinc “muller” and acid; now a bath of acid is more generally used, and the operation is known as “passing,” while the plates are quite thin, which renders them suitable for bending round the cylinders of rotary machines.

So far we have been dealing with plain zinc, but variations are carried out by the addition of the surface or by coating the plate with a composition closely allied to lithographic stone and applied in a form of semi-solution. This class of plate was first invented by Messrs C. & E. Layton, and a modification was invented by Messrs W. & S. Layton, which has been carried on by Mr W. Layton himself. The process of perfection for transferred work such as Christmas cards. A treatment of iron plates by exposing them to a high temperature has recently been patented, and has had some measure of success, while the same treatment for printing on a stone is patented by Mr H. S. Inman, who has treated the stone so as to secure greater porosity and freedom from oxidization, rapidly securing a good position as a stone substitute.

Preparation of the Stones.—In this department the cleanliness so necessary is brought to light through the greater number of stones observed, and a leading point is to secure a level surface and to ensure that the front and back of the stone are strictly parallel, i.e., that the stones stand the test of both the straight edge and the callipers. A good plan to ensure evenness on the surface is to mark the front with two diagonal lines of some non-gracey substance till the top stone (which should not be too small, and should be constantly revolved on the larger one) has entirely removed them. The application of the straight edge from time to time will end in securing the desired flatness, on which so much of the future printing quality depends. The usual method is to rub out with sand, and then rub with pumice and polish with water of Ayr or slate stone. For chalk work, the stone is covered with a thin coat of gum, and left to dry slowly. A muller on the surface with exceedingly fine sand or powdered glass. Many applications (some very expensive) have been devised for doing the principal part of this work by machine—one more effective than others—consists in rotating a plate, with a piece of mica on a rod attached to the ceiling, guided by hand over all parts of the stone; but for large surfaces the ceiling needs to be rather high so as to allow of a long expanding rod reaching the surface at a moderate angle. With this method the degree of accuracy of the plates, in which wide variations of speed are possible, and the machine can be driven so slowly and evenly as to secure a very fair (but not first class) grain, in addition to speedy rubbing out, which is the chief aim of this method.

Preparing a Subject in Chalk or Chalk and Tints.—This branch of work is much less in demand than formerly. A grey stone having been selected and finely grained with sand or powdered glass passed over it, as a rule, the subject is only of moderate size and the one being worked being made his tracing, this tracing is reversed upon the stone with the interposition of a piece of paper coated with red chalk, and the chalk side towards the surface; the lines on the tracing are then gone over with a tracing point, so that a reproduction in red chalk is left upon the stone. It will then be desirable to secure a stock of pointed Lemercier chalks of at least two grades, hard and soft: the point is a matter that requires experience, and is done by the worker drawing two straight lines, the lower one being curved to fit the curve of the stone. The writer's plan is to put a point upon a piece of cheese. Care should be taken that the falling pieces are gathered into a box, or they may do irreparable mischief to the work. The work of outlining is done with No. 1 or 2 chalk, but the finer and more delicate work is generally done with No. 3, and chiefly on this grade, securing rich dark effects by tinting or going over the stone in various directions and then finishing with lithographic ink where absolute blacks are required. This ink (Vanhuyseocck's or Lemercier's are two good makes) needs careful preparation, the method being to warm a saucer and rub the ink dry upon it, then add a little distilled water and incorporate with the finger. It is of great importance not to use any ink left over for the day, for it is almost always to have a fresh daily supply.

When the drawing is thus completed, it will require what is termed etching, by which the parts intended to receive the printing ink, and which are etched or etched thoroughly, are marked for greasing, to be left above the unprotected surface. The acid and gum mixture varies according to the quality of the work and the character of the stone. A patiently executed specimen will, for instance, stand more etching than a less well-executed one. The debouche is sometimes settled by experience, a safe course being to watch the action that occurs when a small quantity is placed on the unused margin of the stone. Many put the etching mixture on with a flat camel-hair brush. The writer's own preference is to pour the mixture on to the stone and let it in a slanting position; or it is perhaps better to have an etching trough, a strong box linied with pitch, with bearers at the bottom to prevent bumping, in which the stone remaining in contact with it, and a hole through which the diluted acid is poured. Experience in etching is then done with acid and water poured over the stone while in a sloping position, and the subsequent pouring of a solution of gum arabic completes the preparation. The late Mr William Simpson, whose work in lithographs is well known, once stated to the Society of Arts that in his opinion Mr Louis Haghe's reproduction
of David Robert's great picture of 'The Taking of Jerusalem,' was the most important piece of chalk lithography ever executed, and that he well remembered that it took two years to execute it, and that all the combined talent of Messrs Day & Hague's establishment was used in its production. He also said that the first stone was not etched, on which precaution, it was under-etched, and that after half a dozen impressions the great beauty and brilliancy of the work had departed. This incident indicates sufficiently the serious nature of this part of the process. In Lithography, the work is so delicate that it may be impossible to do it with the required accuracy.

If the chalk drawing has to have tints, it will be necessary to make as many dusted offsets as there are colours to be used; in this class of work there are generally only two, one warm or sandy shade and the other a quiet blue, and those with the black colour secured by the superposition of the two shades, give an excellent result, of which Hague's sketches in Belgium may be taken as a leading example.

In printing subjects suitable for present-day printing in the machine, the paper will require to be of a good "rag" quality, free from size and damp before printing. To secure accuracy of register the paper must be kept in a damp cloth to prevent the edges drying, and other machines should be kept available for each of the tints so that all work printed in black in the morning may be completed the same night. In this way large editions might be printed of either original or retransferred work at prices rendering the prints suitable for high-class magazines.

Preparing a Chromo Lithograph.—For this purpose the proceedings will be much the same as those suggested for the black and tint work, but the preliminary tracing will be done in lithographic ink on tracing paper, and the stone will be engraved. The plate will be finally etched in the usual manner, and the ink and water of the stone to be transferred. On receiving the dilute ink, the stone is washed with water and the open parts of the stone are filled with India ink, and then left to dry. The ink is then wiped off and the stone washed with water, and the process is repeated until the stone is thoroughly etched. The ink is then placed on the stone, and the stone is then placed in the press and the paper is placed on the stone. The work is then pressed and the paper is removed, and the stone is then placed in the press and the process is repeated until the stone is thoroughly etched.

The next step is to print the work on the stone, and this is done by placing the paper on the stone and then passing it under the press. The paper is then removed, and the stone is washed with water and the open parts of the stone are filled with India ink, and then left to dry. The ink is then wiped off and the stone washed with water, and the process is repeated until the stone is thoroughly etched. The ink is then placed on the stone, and the stone is then placed in the press and the paper is placed on the stone. The work is then pressed and the paper is removed, and the stone is then placed in the press and the process is repeated until the stone is thoroughly etched.

In regard to paper, a description made of rag or rag and esparto is most desirable for all work on grained stones, but for work in ink and water, a good coated paper with a "sight" size in it is frequently desirable; this paper is generally called "chromo" paper.

There is at present very little encouragement for the high class of chromo lithography that was so much in evidence from 1865 to 1875, but there is little doubt that the work could be done equally well by the present-day craftsmen if the demand revived. Belonging to the period mentioned, distinguished examples of chromo-lithographic work, such as "Peasants" and the Lumley Portrait of Shakespeare, by Risdon; "Queen Victoria receiving the Guards," by W. Burney, after John Gilbert; and the series of chinos after John Leech, produced under the direction of Dr. Llewellyn-Williams, published by the Arundel Society, were executed in England, but many reproductions of water-colours after Birket Foster, Richardson, Wainwright and others were executed by Samuel Hodson, James Leckie, and others. In the modern times has been the reproduction of Pellegrini's and Leslie Ward's drawings for Vanity Fair, which from 1870 to 1906 were with very few exceptions executed by the firm of Victor Brooks, Day & Son.

Transfers.—A very large proportion of work is got on to the stone by transfer, and there is no more important part of the business perhaps at the present time. When there is so much original lithographic done on grained paper by artists of every degree, the necessity of a perfectly executed paper drawing is the most important. The stone most desirable for this purpose will be neither a grey nor a light yellow, but one that stands mid-way between the two; it should be very carefully polished so as to be quite free from scratches, and brought to blood heat by being gradually heated in an iron cup board prepared with the necessary apparatus. The methods that sometimes prevail of pouring boiling water over the stone, heating with the flame of an ordinary plumber's lamp, or even heating the surface in front of a fire, are ineffective substitutes, for the surface may thus be altered beyond the control of the artist, and so may be disfigured, and the work, and nearly all the composition comes up in the stone; it should then be pulled through twice, after which it should be dampened on the back and pulled through several times; after this has again been well dampened the paper will be found to peel complete off the stone. By following this method, the protecting medium round the base of each grain of work and of a very vigorous "etch" being applied. As before stated it is not unusual to secure 2000 to 3000 good copies in the machine after the rollers, the ink, and the superintendence must be of the best.

When the artist who is not a proficient lithographer desires to make tints to his work, a reversed offset on grained paper should be made, and the stone cut up as described below. It is usual to have one or two tints to a stone, but by this method a large number of tints to a single stone can be made. In the usual way on a hard piece of paper, and while it is yet wet this should be red and a piece of grained paper and pulled through again, when the grained paper will be found to have received the greater part of the tint which it is desired to transfer. When the stone is pulled the powder of a red shade to prevent the grease passing into the paper, and the drawing of the tints should then be proceeded with in the usual way. Another method of transferring work is to pull impressions from the stone by putting a sheet of paper on the stone, and then melting the protecting medium round the base of each grain of work and of a very vigorous "etch" being applied. As before stated it is not unusual to secure 2000 to 3000 good copies in the machine after the rollers, the ink, and the superintendence must be of the best.

Machinery.—The chief items are the hand presses and the machines, which in this country the trade of manufacture being Leeds, Otley and Edinburgh. Stimulated by American competition, the standard of excellence in the United Kingdom has been very considerably raised of late years. The rotary machines have only very rarely adopted the use of aluminium and zinc, but these materials are more suitable to the general use of an office, the chief reason being that corrections on stone are more easily accomplished and more lasting when done. Presses of all kinds are so frequently done on the stone and transferred to plates for the machine.
The following treatises may be referred to with advantage by those in search of more detailed information: A Complete Course of Lithography, by Alois Semper and L. Richmond; Grammar of Lithography, by W. D. Richmond (13th edition, E. Menken, London); Handbook of Lithography, by David Cumming (London, A. & C. Black). The first of these will only be found in libraries of importance; the others are present-day text-books.

LITHOSPHERE (Gr. λίθος, a stone, and σφαιρα, a sphere), the crust of the earth surrounding the earth's nucleus. The superficial soil, a layer of loose earthy material from a few feet to a few hundreds of feet in thickness, lies upon a zone of hard rock, many thousands of feet in thickness but varying in character, and composed mainly of sandstones, shales, clays, limestones and metamorphic rocks. These two layers form the lithosphere. All the tectonic movements of the solid nucleus produce changes in the mobile lithosphere. Volcanic and seismic activity is manifested, mountains are folded, levels change, fresh surfaces are exposed to denudation, erosion and deposition. The crust is thus subject to constant change while retaining its more or less permanent character.

LITHUANIANS and LETTS, two kindred peoples of Indo-European origin, which inhabit several western provinces of Russia and the north-eastern parts of Poland and Prussia, on the shores of the Baltic Sea, and in the basins of the Niemen and of the Duna. Large colonies of Lithuanian and Lettic emigrants have been established in the United States. The two races number about 3,500,000, of whom 1,500,000 are Letts. Little is known about their origin, and nothing about the time of their appearance in the country they now inhabit. Ptolemy mentions (iii. 5) two clans, the Galindae and Sudeni, who probably belonged to the western subdivision of this racial group, the Borussians. In the 10th century the Lithuanians were already known under the name of Litva, and, together with two other branches of the same stem—the Borussians and the Letts—occupied the south-eastern coast of the Baltic Sea from the lakes Vierzi-järvi and Peipus, south-east to the watershed between the affluents of the Baltic and those of the Black Sea, and south to the middle course of the Vistula (Brest Litovsk)—a tract bounded by Finnish tribes in the north, and by Slavs elsewhere.

Inhabiting a forested, marshy country the Lithuanians have been able to maintain their national character, notwithstanding the vicissitudes of their history. Their chief priest, Krīve-Krīvietis (the judge of the judges), under whom were seventeen classes of priests and elders, worshipped in the forests; the Waidelots brought their offerings to the divinities at the foot of oaks; even now, the veneration of great oaks is a widely spread custom in the villages of the Lithuanians, and even of the Letts.

Even in the 10th century the Lithuanian stem was divided into three main branches—the Borussians or Prussians; the Letts (who call themselves Latvis, whilst under the name which they are known in Russian chronicles, Letyghia, is an abbreviation of Latin-salas, “the confines of Lithuania”); and the Lithuanians, or rather Lithuanians, Litva or Leteviminālas,—these last being subdivided into Lithuanians proper, and Zhmudź (Zmuds, Samogitians or Zemaitien), the “Lowlanders.” To these main branches must be added the Yadzygas, or Yadzvingi, a warlike, black-haired people who inhabited the forests at the upper tributaries of the Niemen and Bug, and the survivors of whom are easily distinguishable as a mixture with White-Russians and Mazurs in some parts of Grodno, Potsk, Lonza and Warsaw. Nestor’s chronicle distinguishes also the Zhemgola, who later became known under the name of Sermgaļa, and in the 10th century inhabited the left bank of the Duna. Several authors consider also as Lithuanians the Kurs of Russian chronicles, or Courons of Western authors, who inhabited the peninsula of Courland, and the Golod, a clan settled on the banks of the Parnava, tributary of the Moskva river, which seems to have been thrown far from the main stem during its migration to the north. The Krīve-Krīvieti, who inhabited what is now the government of Smolensk, seem to belong to the same stem. Their name recalls the Krīve-Krīevyto, and their ethnological features distinguish the Lithuanians; but they are now as much Slavonic as Lithuanian.

All these peoples are only ethnographical subdivisions, and each of them was subdivided into numerous independent clans and villages, separated from one another by forests and marshes; they had no towns or fortified places. The Lithuanian territory thus lay open to foreign invasions, and the Russians as well as the German crusaders availed themselves of the opportunity. The Borussians soon fell under the dominion of Germans, and ceased to constitute a separate nationality, leaving only their name to the state which later became Prussia. The Letts were driven farther to the north, mixing there with Livs and Ehsts, and fell under the dominion of the Livonian order. Only the Lithuanians proper, together with Samogitians, succeeded in forming an independent state. The early history of this state is imperfectly known. During the continuous petty war carried on against Slavonic invasions, the military chief of one of the clans, Ryngold, acquired, in the first half of the 13th century, a certain preponderance over other clans of Lithuania and Black Russia (Yatvyagy), as well as over the republics of Red Russia. At this time, the invasions of the Livonian order becoming more frequent, and always extending southward, there was a general feeling of the necessity of some organization to resist them, and Ryngold’s son, Mendowg, availed himself of this opportunity to pursue the policy of his father. He made different concessions to the order, ceded to it several parts of Lithuania, and even agreed to be baptized, in 1259, at Novograd Litovsk, receiving in exchange a crown from Innocent IV., with which he was crowned king of Lithuanians. He also ceded the whole of Lithuania to the order in case he should die without leaving offspring. But he had accepted Christianity only to increase his influence among other clans; and, as soon as he had consolidated a union between Lithuanians, Samogitians and Cours, he relapsed, proclaiming, in 1260, a general uprising of the Lithuanian order. Mendowg was driven by the Letts and the Samogitians to the lakes Vierzi-järvi and Peipus, south-east, and was thrown into the waters, but internal wars followed, and three years later Mendowg was killed. About the end of the 13th century a new dynasty of rulers of Lithuania was founded by Lutuwere, whose second son, Gedymyn (1316–1341), with the aid of fresh forces he organized through his relations with Red Russia, established something like regular government; he at the same time extended his dominions over Russian countries—over Black Russia (Novogradok, Zitolit, Grodno, Slonim and Volkovysk) and the principalities of Polotsk, Touroukov, Pinsk, Vitkebat and Volynia. He named himself Rex Lithuanorum et molitvarum Rutheniorum. In 1323 he concluded a treaty with Poland against the Livonian order, which treaty was the first step towards the union of both countries realized two centuries later. The seven sons of Gedymyn considered themselves as quite independent; but two of them, Olgierd and Keistut, soon became the more powerful. They were divided amongst themselves by several dispositions which existed at that time in Lithuania. Olgierd, whose family relations attracted him towards the south, was the advocate of union with Russia; rather politician than warrior, he increased his influence by diplomacy and by organization. His wife and sons being Christians, he also soon agreed to be baptized in the Greek Church. Keistut represented the revival of the Lithuanian nationality. Continually engaged in wars with Livonia, and remaining true to the national religion, he became the national legendary hero. In 1345 both brothers agreed to re-establish the great principality of Lithuania, and, after having taken Vilna, the old sanctuary of the country, all the brothers recognized the supremacy of Olgierd. His son, Jagielo, who married the queen of Poland, Jadwiga, after having been baptized in the Latin Church, was crowned, on the 14th of February, 1386, king of Poland. At the beginning of the 15th century Lithuania extended her dominions as far east as Vyazma on the banks of the Moskva river, the pretendent government of Kazlje and Poutivl, and as far south as Pollava, the shores of the Sea of Azov, and Haji-Ley (Odesa), thus including Kiev and Lutsk. The union with
LITHUANIANS AND LETTS

Poland remained, however, but nominal until 1569, when Sigismund Augustus was king of Poland. In the 16th century Lithuania did not extend its power so far east and south-east as two centuries before, but it constituted a compact state, including Polotsk, Moghilev, Minsk, Grodno, Kovno, Vilna, Brest, and reaching as far south-east as Chernigov. From the union with Poland, the history of Lithuania becomes a part of Poland's history, Lithuanians and White-Russians partaking of the fate of the Polish kingdom (see Poland: History). After its three partitions, they fell under the dominion of the Russian empire.

In 1792 Russia took the provinces of Moghilev and Polotsk, and in 1793 those of Vilna, Troki, Novgorod-Syversk, Brest and Vitebsk. In 1797 all these provinces were united together, constituting the "Lithuanian government" (Litovskaya Gubernia). But the name of Lithuanian provinces was usually given only to the governments of Vilna and Kovno, and, though Nicholas I prohibited the use of this name, it is still used, even in official documents. In Russia, all the White-Russian population of the former Polish Lithuania are usually considered as Lithuanians, the name of Zhmud being restricted to Lithuanians proper.

The ethnographical limits of the Lithuanians are undefined, and their number is variously estimated. The Letts occupy a part of the Courland peninsula of Livonia and of Vitebsk, a few other territories being spread also in the governments of Kovno, St Petersburg and Moghilev. The Lithuanians proper inhabit the governments of Kovno, Vilna, Suvalki and Grodno; while the Samogitians or Zhmud inhabit the governments of Kovno and Suvalki. To these must be added about 200,000 Borussians, the whole number of Lithuanians and Letts in Russia being, according to the census of 1897, 3,094,496. They are slowly extending towards the south, especially the Letts; numerous emigrants have penetrated into Slavonic lands as far as the government of Voronezh.

The Lithuanians are well built; the face is mostly elongated, the features are prominent; the very fair hair, blue eyes and delicate skin distinguish them from Poles and Russians. Their dress is usually plain in comparison with that of Poles, and the predominance in it of greyish colours has been frequently noticed. Their chief occupation is agriculture. The trades in towns are generally carried on by men of other races—mostly by Germans, Jews or Poles. The only exception is afforded to some extent by the Letts. The Samogitians are good hunters, and all Lithuanians are given to apiculture and cattle-breeding. Lithuanian and Lettish versifications differ as much as in the central ones, were not until the most recent time proprietors of the soil they tilled. They have given a few families to the Russian nobility, but the great mass of the people became serfs of foreign landowners, German and Polish, who reduced them to the greatest miseries. The liberation, the emancipation of the Lithuanian has given to the Lithuanians the land of the Polish proprietors on much easier terms than in central Russia; but the allotments of soil and the redemption taxes are very unequally distributed; and a not insignificant number of peasants (the chinkiski) were even deprived of the land they had for centuries considered their own.

The Letts remain in the same states as before, and are restrained from emigrating en masse only by coercive measures.

The Letts of Courland, with the exception of about 50,000 who belong to the Greek Church, are Lutherans. Nearly all can read. Those of the government of Vitebsk, who were under Polish dominion, are Roman Catholics, as well as the Lithuanians proper, a part of whom, in the time of Pope Sixtus V, returned to the Church, and were before the union with Poland. The Samogitians are Roman Catholics; they are more than other Lithuanians have conserved their national features. But all Lithuanians have maintained much of their old religion, preserved the names of pagan divinities, very numerous in the former mythopoeia, are continually mentioned in songs, and also in common speech.

Language and Literature.—The Lithuanian, Lettish or Lettish and Borussian or Old Prussian languages together constitute a distinct linguistic subdivision, commonly called the Baltic subdivision, within the Indo-European family. They have many affinities to the Slavonic languages, and are sometimes included with them in a single linguistic group, the Balto-Slavic. In their phonology, however, though not in their structure, the Baltic languages appear to be more primitive than the Slavonic. Lithuanian, for example, retains the archaic diphthongs which disappeared in Slavonic—Lith. vidas, face, Gr. ὑώδης, O.S. vīdū. Among other noteworthy phonological characteristics of Lithuanian are the conversion of k into a sibilant, the loss of k and change of all aspirates into tenues and the retention of primitive consonantal noun-terminations, e.g. the final s in Sans. Vīdūs, Lith. vīkus, O.S. vīkūtē. Lettish is phonologically less archaic than Lithuanian, although in a few cases it has preserved Indo-European forms which have been changed in Lithuanian, e.g. the s and z which have become Lith. ši (sh) and z (ch). The accent in Lithuanian is free; in Lettish, and apparently in Old Prussian, it ultimately became fixed on the first syllable. In its morphology Lettish represents a later stage of declension than Lithuanian, the first declension ending variously analogous to that between Old High German and Gothic. Both languages have preserved seven out of the eight Indo-European cases; Lithuanian has three numbers, but Lettish has lost the dual (except in dvi, "two" and abi, "both"); the neuter gender, which still appears in Lithuanian, has been entirely lost in Lettish; in Lithuanian there are four simple tenses (present, future, imperfect, preterite), but in Lettish the imperfect is wanting. In both languages the number of periphrastic verb-forms and of diminutives is large; in both there are many suffixes which are either absent or infrequent in the other. There is a tendency to a simplification of grammatical categories, and to many words became attached that were originally used only in the local dialects, Low (spoken in N.W. Courland and Middle (the literary language). Old Prussian ceased to be a spoken language in the 17th century; its literary remains, consisting chiefly of devotional works and two brief vocabularies, date almost entirely from the period 1517-1561 and are insufficient to permit of any thorough reconstruction of the grammar.

The literary history of the Lithuanians and Letts dates from the Reformation and comprises three clearly defined periods. (1) Up to 1700 the chief printed books were of a liturgical character. (2) During the 18th century a vigorous educational movement began; dictionaries, grammars and other instructive works were compiled, and written poems began to take the place of songs preserved by oral tradition. (3) The revival of national sentiment at the beginning of the 19th century resulted in the establishment of newspapers and the compilation and publication of the national folk-poetry. In both literatures, works of a religious character predominate, and both are rich in popular ballads, folk-tales and fables.

The first book printed in Lithuanian was a translation of Luther's shorter Catechism (Konigsberg, 1547); other translations of devotional or liturgical works followed, and by 1701 59 Lithuanian books had appeared, the most noteworthy being those of the preacher J. Brektun (1555-1602). The spread of Calvinism led to the publication, in 1701, of a Lithuanian New Testament. The first dictionary was printed in 1749. But perhaps the most remarkable work of the second period was The Four Seasons, a pastoral poem in hexameters by Christian Donalitius (1714-1750), which was edited by Nesselmann (Konigsberg, 1860) with a German translation and notes. In the 19th century various collections of fables and folk-tales were published, and an epic, the Onikisha Grove, was written by Bishop Baranowski. But it was in journalism that the chief originative work of the third period was done. F. Kelch (1801-1877) founded the first Lithuanian newspaper, and between 1834 and 1895 no fewer than 34 Lithuanian periodicals were published in the United States alone.

Luther's Catechism (Konigsberg, 1548) was the first book printed in Lettish, as in the sister speech. In the 17th century various translations of psalms, hymns and other religious works were published, the majority being Calvinistic in tone. The educational movement of the 18th century was inaugurated by G. F. Stender (1714-1760), author of a Lettish dictionary and grammar, of poems, tales and of a Book of Wisdom which treats of elementary science and history. Much educational work was subsequently done by the Lettish Literary Society, which publishes a magazine (Magazin, Mitau, from 1827), and by the "Young Letts," which published various periodicals and translations of foreign classics, and endeavoured to free
their language and thought from German influences. Somewhat similar tasks were undertaken by the "Young Lithuanians," whose movement was fostered by the book Auza ("Dawn") was founded in 1881. From 1890 to 1910 the literature of both peoples was marked by an ever-increasing nationalism; among the names most prominent during this period may be mentioned those of the dramatist Stepaner and the poet Martin Lap, both of whom wrote in Lettish.

**LITMUS** (apparently a corruption of *laucus*, Dutch *laacoe, lac, lac, and moes, pulp, due to association with lit, an obsolete word for dye, colour; the Ger. equivalent is Lackmus, Fr *tourcasol*), a colouring matter which occurs in commerce in the form of small blue tablets, which, however, consist mostly, not of the pigment proper, but of calcium carbonate and sulphate and other matter devoid of tintorial value. The reaction is extremely important as an indicator for the detection of free acids and free alkaalis. An aqueous infusion of litmus, when exactly neutralized by an acid, exhibits a violet colour, which by the least trace of free acid is changed to red, while free alkaali turns it to blue. The reagent is generally used in the form of test paper—bibulous paper dyed red, purple or blue by the respective kind of infusion. Litmus is manufactured in Holland from the same kinds of lichens (species of *Roccuela* and *Lecanora*) as are used for the preparation of archil (q.v.).

**LITOPTERNA,** a suborder of South American Tertiary ungulate mammals typified by *Macrochaenith, and taking their name ("smooth-heel") from the presence of a flat facet on the heel-bone, or calcaneum for the articulation of the fibula. The more typical members of the group were digitigrade animals, reduced to small size. The limbs were of the same length as those of horses; there were no rudimentary trochanters, and a facet on the calcaneum for the fibula. The cheek-dentition approximates or more to the perissodactyle type. Both the terminal faces of the cervical vertebrae is flat, the femur carries a third trochater, the bones of both the carpus and tarsus are arranged in linear series, and the number of toes, although commonly three, varies between one and five, the third or middle digit being invariably the largest. Of the two families, the first is the *Proterotheridae*, which exhibits, in respect of the reduction of the digits, a curious parallelism to the equine line among the Perissodactyla; in this feature, as well as in the reduction of the teeth, it is more specialized than the second family, a near relative of the *Palaecotherium* type, but have a more or less strongly developed median longitudinal cleft. The three-toed type is represented by *Diadophorus*, in which the dental formula is *i*, 4, 1, p, 4, /, and the teeth are very like those of *Hippopotram*.

The cervical vertebrae are of normal form, the orbit (as in the second family) is encircled by bone, the last molar has a third lobe, the single pair of upper incisors are somewhat elongated, and have a gap between and behind them, while the outer lower incisors are larger than the inner pair, the canines dull small. The skull has a short muzzle, with elongated nasals. Remains of this and the other representatives of the group are found in the Patagonian Miocene. In *Proterotherium*, which includes smaller forms having the same, or nearly the same, dental formula, the molar teeth differ from those of *Diadophorus* by the deeper median longitudinal cleft, which completely divides the crown into an inner and an outer moiety, the two cones of the inner half being united. According to the description given by Argentine palaeontologists, *Macrochaenith* is also three-toed, the single-toed representative of the family being *Theatherium*, in which the lateral metapodials, or splint-bones, are even more reduced than in the *Equidae*.

In the second family—*Macrochaenithiidae*—the dentition is complete (forty-four) and without a gap, the crowns of nearly all the teeth being of nearly uniform height, while the upper molars are distinguished from those of the *Proterotheridae* by a peculiar arrangement of their two inner cones, and the elevation of the antero-posterior portion of the cingulum so as to form an extra pit on the crown. To describe this arrangement in detail is impossible, here, but it may be stated that the two inner cones are closely approximated, and separated by a narrow V-shaped notch on the inner side of the crown. The elongated cervical vertebrae are peculiar in that the arch is perforated by the artery in the same manner as in the llamas.

In the Santa Cruz beds of Patagonia the family is represented by the generalized genus *Oxyodontotherium* (in which *Theosodon* may apparently be included). It comprises animals ranging up to the size of a tapir, in which the nostrils were more or less in the normal anterior position, and the cheek-teeth short-crowned, with the inner cones of the upper molars well developed and separated by a notch, and the pits of moderate depth. The last upper premolar is simpler than the molars, and the canine, which may be double-rooted, is like the earlier premolars. The radius and ulna, like the tibia and fibula, are distinct, and the limb-bones rudimentary. On the other hand, the *Macrochaenithias* was a much larger llama-like animal, the skull is elongated and narrow, with rudimentary nasals, and the aperture of the nose placed nearly on the line of the eyes and directed upwards, the muzzle not improbably terminating in a short trunk. Deep pits on the forehead probably served for the attachment of special muscles connected with the latter. Very curious is the structure of the cheek-teeth, which are high-crowned, with the inner cones reduced to mere points, and the crowns on the crown-surface large and funnel-shaped. In fact, the perissodactyle type is almost lost. The cervical vertebrae and limb-bones are very long, the radius and ulna being completely, and the tibia and fibula partially, united. The typical *M. patagonica* is a Pleistocene form as large as a camel, ranging from Patagonia to Brazil, but remains of smaller species have been found in the Pliocene (q.v. of Bolivia and Argentina.

The imperfectly known *Scalabrinia* of the Argentine Pliocene appears to occupy a position intermediate between *Oxyodontotham* and *Macrochaenithia*, having the nasal aperture situated in the middle of the length of the skull, and the crowns of the cheek-teeth nearly as tall as in the latter, but the lower molars furnished with a projecting process in the hinder valley, similar to one occurring in those of the former.

In this place may be mentioned another strange ungulate from the Santa Cruz beds of Patagonia, namely, *Astrapotham*, sometimes regarded as typifying a suborder by itself. This huge ungulate had cheek-teeth singularly like those of a rhinoceros, and an enormous pair of tusk-like upper incisors, recalling the upper jaw of *Macrochaenithias* on an enlarged scale. In the lower jaw two large tusk-like canines, between which are three pairs of curiously-formed spatulate incisors, and in both jaws there is a long diastema. The dental formula appears to be *i,j*, *c,j*, *p,j*, *m,j*.

Next *Astrapotham* may be provisionally placed the genus *Homalodontotham*, of which the teeth have much lower crowns, and are of a less decidedly rhinocerotic type than in *Astrapotham*, and the whole dentition forms an even and unbroken series. The bodies of the cervical vertebrae are short, with flattened articular
surfaces, the humerus has an enormous deltoid crest, suggestive of fossorial powers, and the femur is flattened, with a third trochanter. According to the Argentine palaeontologists, the carpus is of the alternating type, and the terminal phalanges of the pentadactyle feet are bifid and very like those of Edentata. Indeed, this type of foot shows many edentate resemblances. The astragalus is square and flattened, articulating directly with the navicular, although not with the cuboid, and having a slightly convex facet for the calcaneus, with which it has no direct attachment. The middle of foot, which is stated to have been found in association with the skull, it has been suggested that *Homalodontotherium* should be placed in the *Ancylopus* (q.v.), but, to say nothing of the different form of the cheek-teeth, all the other South American Santa Cruz ungulates are so different from those of other countries that this seems unlikely.

It may be suggested that we have rather to deal with an instance of parallelism—*a view supported by the parallelism to the Equidae as presented by certain members of the *Prototheriidae*. (R. L.)

**LITOTES** (Gr. ἐξοτέρησις, plainness, ἐξόσ, plain, simple, smooth), a rhetorical figure in which emphasis is secured for a statement by turning it into a denial of the contrary, e.g. “a citizen of no mean city,” *i.e.* a citizen of a famous city, “A is not a man to be neglected.” Litotes is sometimes used for what should be more strictly called “meliosis” (Gr. μελίωσις, lessening, diminution, μελίων, lesser), where the expressions used apparently are worse than the condition in order to heighten the effect. The most familiar instance of this is the familiar saying: “It is not so bad but that,” which is really a Litotes.

**LITTER** (through O. Fr. littere or littere, mod. litière from Med. Lat. lectaria, classical lectica, lectus, bed, couch), a word used of a portable couch, shut in by curtains and borne on poles by bearers, and of a bed of straw or other suitable substance for animals; hence applied to the number of young produced by an animal at one birth, and also to any disordered heap of waste material, rubbish, &c. In ancient Greece, prior to the influence of Asiatic luxury after the Macedonian conquest, the litter (φορείω) was only used by invalids or by women. The Romans, when the *lectica* was introduced, probably about the latter half of the 2nd century B.C. (Gellius x. 3), used it only for travelling purposes. Like the Greek or Asiatic litter, it had a roof of skin (pellis) and side curtains (vela, plagae). Juvenal (iv. 20) speaks of transparent sides (latae *specularisibus*). The slaves who bore the litter on their shoulders (suggallare) were termed *lecticarii*, and it was a sign of luxury and wealth to employ six or even eight bearers. Under the Empire the litter began to be used in the streets of Rome, and its use was restricted and graded in the *Privilegium* of Augustus. Claudius, *mod.* (the terracings). Litter must be distinguished from the much earlier *lectica funebris* or *ceretum*, the funeral bier on which the dead were carried to their burial-place.

**LITTLE FALLS**, a city and the county-seat of Morrison county, Minnesota, U.S.A., on both banks of the Mississippi river, about 88 m. N.W. of Minneapolis. Pop. (1890) 2354; (1900) 5774, of whom 1559 were foreign-born, chiefly Germans and Swedes; (1903) 3856; (1910) 6078. It is served by the Northern Pacific railway. The city is situated in a prosperous farming region, and has excellent water-power and various manufactures. Little Falls was settled about 1850, was chartered as a city in 1889 and adopted a new charter in 1902. Here was buried the Chippewa chief, Hole-in-the-Day (c. 1827–1868), or Bagwunagigik, who succeeded his father, also named Hole-in-the-Day, as chief of the Chippewas in 1836. Like his father, the younger Hole-in-the-Day led his tribe against the Sioux, and he is said to have prevented the Chippewas from joining the Siouan tribes rising in 1862. His body was subsequently removed by his relatives.

**LITTLE FALLS**, a city of Herkimer county, New York, U.S.A., on the Mohawk river, 21 m. E. S.E. of Utica. Pop. (1890) 8783; (1900) 10,381, of whom 1915 were foreign-born; (1910 census) 12,273. It is served by the New York Central & Hudson River, the West Shore, the Utica & Mohawk (electric), and the Little Falls & Dolgeville railways (the last named being 13 m. long and running only to Salisbury Center and by the Erie canal). The Mohawk river falls here by a series of rapids 45 ft. in less than a mile, furnishing water power. Among the manufactures are cotton yarn, hosiery and knit goods, leather, &c. In 1905 the city’s factory products were valued at $4,477,680. The city has one of the largest cheese-markets in the United States. The manufacture of flour and gist-mill products was formerly an important industry; a mill burned in 1872 by Tories and Indians had supplied almost the entire Mohawk Valley, and particularly Forts Herkimer and Dayton. Near the city is the grave of General Nicholas Herkimer, to whom a monument was erected in 1896. Little Falls was settled by Germans in 1782, and was almost immediately destroyed by Indians and Tories. It was resettled in 1790, and was incorporated as a village in 1811 and as a city in 1895.

See George A. Hardin, *History of Herkimer County* (Syracuse, 1893).

**LITTLEHAMPTON**, a seaport and watering-place in the Chichester parliamentary division of Sussex, England, at the mouth of the Arun, 62 m. S. by W. from London by the London, Brighton & South Coast railway. Pop. of urban district (1901) 7363. There is a beach of firm sand. The harbour is easily accessible in all weathers, and has a small general trade.

**LITTLE ROCK**, the capital of Arkansas, U.S.A., and the county-seat of Pulaski county, situated near the centre of the state and on the S. bank of the Arkansas river, at the E. edge of the Ozark foothills. Pop. (1890) 25,874; (1900) 38,307; of which 88% were negroes and 20% were foreign-born; (1910 census) 42,099. The Regions is in the Chicago, Rock Island & Pacific, the St Louis South Western, and the St. Louis, Iron Mountain & Southern railways and by river boats. It occupies a comparatively level site of 11 sq. m. at an altitude of 250 to 400 ft. above sea-level and 50 ft. or more above the river, which is crossed here by three railway bridges and by a county bridge. The city derived its name (originally “le Petit Roche” and “The Little Rock”) from a rocky peninsula in the Arkansas, distinguished from the “Big Rock” (the site of the army post, Fort Logan H. Roots), 1 m. W. of the city, across the river. The Big Rock is said to have been first discovered and named “Le Rocher Français” in 1722 by Sieur Bernard de la Harpe, who was in search of an emerald mountain; the Little Rock is now used as an abutment for a railway bridge. The state capitol, the state insane asylum, the state dead mate institute, the state school for the blind, a state reform school, the penitentiary, the state library and the medical and law departments of the state university are at Little Rock; and Little Rock is the seat of the United States court for the eastern district of Arkansas. The city is the seat of the Arkansas state land office, of Little Rock College, of the St Mary’s Academy of a Roman Catholic orphanage and a Roman Catholic convent, and of two schools for negroes—the Philander Smith College (Methodist Episcopal, 1857), co-educational, and the Arkansas Baptist College. The city is the seat of Protestant Episcopal and Roman Catholic bishops. Little Rock has a Carnegie library (1908), an old ladies’ home, a Florence Crittenton rescue home, a children’s home, St Vincent’s infirmary, a city hospital, a Catholic hospital, a physicians’ and surgeons’ hospital and the Arkansas hospital for nervous diseases. A municipal park system includes City, Forest, Wonderland and West End parks. Immigration from the northern states has been encouraged, and northern men control much of the business of the city. In 1905 the value of factory products was $4,685,787, being 38.5% greater than the value in 1900. Cotton and lumber industries are the leading interests; the value of cotton-seed oil and cake manufactured in 1905 was $697,043, and planing-mill products $835,049, and of lumber and timber products $342,134. Printing, job work publishing and the manufacture of foundry and machine shop products and of furniture are other important industries. Valuable deposits of bauxite are found in Pulaski county, and the mines are the most important in the United States.

Originally the site of the city was occupied by the Quapaw Indians. The earliest permanent settlement by the whites was about 1813–1814; the county was organized in 1818 while still a part of Missouri Territory; Little Rock was surveyed in 1821, was incorporated as a town and became the capital of Arkansas in 1821, and was chartered as a city in 1836. In 1850 its population was only 2167, and in 1860 3727; but in 1870
it was 12,380. Little Rock was enthusiastically anti-Union at the outbreak of the Civil War. In February 1861, the United States Arsenal was seized by the state authorities. In September 1863 the Federal generals William Steele (1819-1885) and John W. Davidson (1824-1881), operating against General Sterling Price, captured the city, and it remained throughout the rest of the war under Federal control. Constitutional conventions met at Little Rock in 1836, 1864, 1868 and 1874, and also the Secession Convention of 1861. The Arkansas Gazette, established at Arkansas Post in 1819 and soon afterwards removed to the new capital, was the first newspaper published in Arkansas and one of the first published west of the Mississippi.

**LITTLETON** (or LYTTLETON), EDWARD, BARON (1589-1645), son of Sir Edward Littleton (d. 1621) chief-justice of North Wales, was born at Munsloe in Shropshire; he was educated at Oxford and became a lawyer, succeeding his father as chief-justice of North Wales. In 1625 he became a member of parliament and acted in 1628 as chairman of the committee of grievances upon whose report the Petition of Right was based. As a member of the party opposed to the arbitrary measures of Charles I. Littleton had shown more moderation than some of his colleagues, and in 1634, three years after he had been chosen recorder of London, the king attached him to his own side by appointing him solicitor-general. In the famous case about ship-money Sir Edward argued against Hampden. In 1640 he was made chief-justice of the common pleas and in 1641 lord keeper of the great seal, being created a peer as Baron Lyttleton. About this time, the lord keeper began to display a certain amount of indifference to the royal cause. In January 1642 he refused to put the great seal to the proclamation for the arrest of the five members and he also incurred the displeasure of Charles by voting for the militia ordinance. However, he assured his friend Edward Hyde, afterwards earl of Clarendon, that he had only taken this step to allay the suspicions of the parliamentary party who contemplated deprivings him of the seal, and he undertook to return to the king. He fulfilled his promise, and in May 1642 he himself joined Charles at York, but it was some time before he regained the favour of the king and the custody of the seal. Littleton died at Oxford on the 27th of August 1645; he left no sons and his barony became extinct. His only daughter, Anne, married her cousin Sir Thomas Littleton, Bart. (d. 1681), and their son Sir Thomas Littleton (c. 1647-1710) was speaker of the House of Commons from 1698 to 1700, and treasurer of the navy from 1700 to 1710. Macaulay thus sums up the character of Speaker Littleton and his relations to the Whigs: “He was one of their ablest, most zealous and most steadfast friends; and had been, both in the House of Commons and at the board of treasury, an invaluable second to Montague” (the earl of Halifax).

**LITTLETON, SIR THOMAS DE** (c. 1407-1481), English judge and legal author, was born, as is supposed, at Blankney Manor House, Worcestershire, about 1407. Littleton's surname was that of his mother, who was the sole daughter and heiress of Thomas de Littleton, lord of Frankley. She married one Thomas Westcote. Thomas was the eldest of four sons of the marriage, and took the name of Littleton, or, as it seems to have been more commonly spelt, Lutettton. The date of his birth is uncertain; a MS. pedigree gives 1422, but it was probably earlier than this. If, as is generally accepted, he was born at Blankney Manor, it could not have been before 1407, in which year Littleton's grandfather recovered the manor from a distant branch of the family. He is said by Sir E. Coke to have attended one of the universities,” but there is no corroboration of this statement. He was probably a member of the Inner Temple, and lectured there on the statute of Westminster II. De Donis Conditionalibus. His name occurs in the Paston Letters (ed. J. Gairdner, i. 60) about 1445 as that of a well-known counsel and in 1481/2 he received a grant of the manor of Sheriff Hales, Shropshire, from Sir William Trussell as a reward for his services as counsel. He appears to have been recorder of Coventry in 1450; he was made escheator of Worcestershire, and in 1447/8 was under-sheriff of the same county; he became serjeant-at-law in 1453 and was afterwards a justice of assize on the northern circuit. In 1466 he was made a judge of the common pleas, and in 1475 a knight of the Bath. He died, according to the inscription on his tomb in Worcester cathedral, on the 23rd of August 1481. He married, about 1444, Joan, widow of Sir Philip Chetwind of Ingestre in Staffordshire, and by her he had three sons, through whom he became ancestor of the families holding the peerages of Cobham (formerly Lyttleton, q.e.) and Hatherton.

His *Treatise on Tenures* was probably written after he had been appointed to the bench. It is addressed to his second son Richard, who went to the bar, and whose name occurs in the year books of the reign of Henry VII. The book, both historically and from its intrinsic merit, may be characterized as the first text-book upon the English law of property. The law of property in Littleton's time was mainly concerned with rights over land, and it was the law relating to this class of rights which Littleton set himself to digest and classify. The time was ripe for the task. Ever since the Conquest regular courts of justice had been at work administering a law which had grown out of an admixture of Teutonic custom and of Norman feudalism. Under Henry II. the courts had been organized, and the practice of keeping regular records of the proceedings had been carefully observed. The centralizing influence of the royal courts and of the justices of assize, working steadily through three centuries, had made the rules governing the law of property uniform throughout the land; local customs were confined within certain prescribed limits, and were only recognized as giving rise to certain well-defined classes of rights, such, for instance, as the security of tenure acquired by villeins by virtue of the custom of the manor, and the rights of freeholders, in some towns, to dispose of their land by will. Thus, by the time of Littleton (Henry VI. and Edward IV.), an immense mass of material had been acquired and preserved in the rolls of the various courts. Reports of important cases were published in the "year books." A glance at Statham's *Abridgment*, the earliest digest of decided cases, published nearly at the same time as Littleton's *Tenures*, is sufficient to show the enormous bulk which reported cases had already attained as materials for the knowledge of English law.

Littleton's treatise was written in that peculiar dialect compounded of Norman-French and English phrases called law French. Although it had been provided by a statute of 36 Edward III. that *viva voce* proceedings in court should no longer be conducted in the French tongue, "which was much unknown in the realm," the practice of reporting proceedings in that language, and of using it in legal treatises, lingered till a much later period, and was at length prohibited by a statute passed in the time of the Commonwealth in 1659. Unlike the preceding writers on English law, Glanville, Bracton and the authors of the treatises known by the names of Britton and Fleta, Littleton borrows nothing from the sources of Roman law or the commentators. He deals exclusively with English law.
The work of Littré occupies a place in the history of typograph as well as of law. The earliest printed edition seems to be that by John Letou and William de Machlinia, two printers who probably came from the Continent, and carried on their business in partnership, as the note to the edition of Littré's *Tenures*, "in civitate Londinorum, juxta ecclesiam omnium sanctorum." The date of this edition is uncertain, but the most probable conjecture, based on typographical grounds, places it about the latter part of 1481. The next edition is one by Machlinia, probably about two or three years later than the former. Machlinia was then in business alone. "Juxta pontem quae velul dicatur Fleta brigge. The next was a Rouen edition, erroneously stated by Sir E. C. Wambaugh, to have been printed about 1533. It was, however, of a much earlier date. Tomlins, the last editor of Littré, gives reasons for thinking that it cannot have been later than 1490. It is stated in a note that has been printed at the beginning of Sir E. C. Wambaugh's edition that original, uncorrected editions of these editions are in the British Museum. In all these editions the work is styled *Tenores Novelli*, probably to distinguish it from the *Old Tenures*.

There are three main MSS. of Littré in the University Library at Cambridge. Some of these formerly contained a note on its first page to the effect that it was bought in St Paul's Churchyard on July 20, 1607. It was therefore in circulation in Littré's lifetime. The modern reissue of Littré's work is based, however, as has been said, on MSS. that contain what is known to be the English translation of the Tenures, and is probably not later than 1500.

In the 16th century editions of Littré followed in rapid succession French and English editions. The successive French editions of which we are aware are those of Pierre de Mesmes, Paris, 1511; Peter du Blay, Lyons, 1513; and Jean Lefèvre, Huy, 1515. The practice of annotating the text caused several additions to be introduced, which, however, are rarely detected by comparison of the earlier copies. In 1571 a French edition was printed with large margins for purposes of annotation, of which we are aware in Lincoln's Inn Library. The practice of annotating Littré was very general, and was adopted by many eminent lawyers besides Sir E. C. A., among others by Sir M. Hale. One commentary of this kind, by an unknown hand of earlier date than Sir E. C. A., was edited by Cary in 1829, following the general practice of dealing with Littré as the great English authority. This edition is the first of a series of works on law, the text of which was ever written in any human science," Sir E. C. A. made it in 1628 the text of that portion of his work which he calls the first part of the institutes of the law of England, in other words, the law of property.

The first printed English translation of Littré was by Rastell, who seems to have combined the professions of author, printer and serjeant-at-law, between 1514 and 1533. Many English editions by various editors followed, the best of which is Tottel's in 1561. Sir E. C. A. adopted some translation earlier than this, which has since been gone by the name of Sir E. C. A.'s translation. He, however, throughout his work not on the translation but on the French text; for on his commentary has to some extent obscured the intrinsic merit of the original.

**Littré, Maximilien Paul Émile** (1801-1881). French lexicographer and philosopher, was born in Paris on the 1st of February 1801. His father had been a gunner, and afterwards sergeant-major of marine artillery, in the French navy, and was deeply imbued with the revolutionary ideas of the day. Setting down as a collector of taxes, he married Sophie Johannott, a free-thinker like himself, and devoted himself to the education of his son Émile. The boy was sent to the Lycée Louis-le-Grand, where Sir E. C. A. was head of the English class. After he had completed his course at school, he hesitated for a time as to what profession he should adopt, and meanwhile made himself master of Latin and Greek. At last he determined to study medicine, and in 1822 entered his name as a student of medicine. He passed all his examinations in due course, and had only his thesis to prepare in order to obtain
LITURGY

his degree as doctor when in 1827 his father died, leaving his mother absolutely without resources. He at once renounced his degree, and, while attending the lectures of P. F. O. Rayer and taking a keen interest in medicine, began teaching Latin and Greek for a livelihood. He carried a musket on the popular side in the revolution of February 1830, and was one of the national guards who followed Charles X. to Rambouillet. In 1831 he obtained an introduction to Armand Carrel, the editor of the National, who gave him the task of reading the English and German papers for excerpts. Carrel by chance, in 1835, discovered the ability of his reader, who from that time became a constant contributor, and eventually director of the paper. In 1836 Littre began to contribute articles on all sorts of subjects to the Revue des deux mondes; in 1837 he married; and in 1839 appeared the first volume of his edition of the works of Hippocrates. The value of this work was recognized by his election the same year into the Académie des Inscriptions et Belles-Lettres. At this epoch he came across the works of Auguste Comte, the reading of which formed, as he himself said, “the cardinal point of his life,” and from this time onward appears the influence of positivism on his own life, and, what is of more importance, his influence on positivism, for he gave as much to positivism as he received from it. He soon became a friend of Comte, and popularized his ideas in numerous works on the positivist philosophy. At the same time he continued his edition of Hippocrates, which was not completed till 1862, published a similar edition of Pliny’s Natural History, and after 1841 took Fauriel’s place on the committee engaged on the Histoire littéraire de la France, where his knowledge of the early French language and literature was invaluable. It was about 1844 that he started working on his great Dictionnaire de la langue française, which was, however, not to be completed till thirty years after. In the revolution of July 1848 he took part in the repression of the extreme republican party in June 1840. His essays, contributed during this period to the National, were collected together and published under the title of Conservation, révolution et positivisme in 1852, and show a thorough acceptance of all the doctrines propounded by Comte. However, during the later years of his master’s life, he began to perceive that he could not wholly accept all the dogmas or the more mystic ideas of his friend and master, but he concealed his differences of opinion, and Comte failed to perceive that his pupil had outgrown him, as he himself had outgrown his master Saint-Simon. Comte’s death in 1858 freed Littre from any fear of embittering his master’s later years, and he published his own ideas in his Paroles de la philosophie positive in 1850, and at still greater length in his work in Auguste Comte et la philosophie positive in 1865. In this book he traces the origin of Comte’s ideas through Turgot, Kant and Saint-Simon, then eulogizes Comte’s own life, his method of philosophy, his great services to the cause and the effect of his works, and finally proceeds to show where he himself differs from him. He approved wholly of Comte’s philosophy, his great laws of society and his philosophical method, which indeed he defended warmly against J. S. Mill, but declared that, while he believed in a positivist philosophy, he did not believe in a religion of humanity. About 1863, after completing his Hippocrates and his Pliny, he set to work in earnest on his French dictionary. In the same year he was proposed for the Académie Française, but resigned, owing to the opposition of Mgr. Dupanloup, bishop of Orleans, who denounced him in his Avertissement aux pères de famille as the chief of the French materialists. He also at this time started with G. Wyrmbouff the Philosophie Positive, a review which was to embody the views of modern positivism. His life was thus absorbed in literary work till the overthrow of the empire called on him to take a part in politics. He felt himself too old to undergo the privations of the siege of Paris, and retired with his family to Brittany, whence he was summoned by M. Gambetta to Bordeaux, to lecture on history, and thence to Versailles to take his seat in the senate to which he had been chosen by the department of the Seine. In December 1871 he was elected a member of the Académie Française in spite of the renewed opposition of Mgr. Dupanloup, who resigned his seat rather than receive him. Littre’s Dictionary was completed in 1871. An authoritative interpretation is given of the use of each word, based on the various meanings it had held in the past. In 1875 Littre was elected a life senator. The most notable of his productions in these years were his political papers attacking and unveiling the confederacy of the Orleanists and legitimists, and in favour of the republic, his republication of many of his old articles and books, among others the Conservation, révolution et positivisme of 1852 (which he reprinted word for word, appending a formal, categorical renunciation of many of the Comtist doctrines therein contained), and a little tract Pour la dernière fois, in which he maintained his unalterable belief in materialism. When it became obvious that the old man could not live much longer, his wife and daughter, who had always been fervent Catholics, strove to convert him to their religion. He had long interviews with Père Millériot, a celebrated propositivist, and was much grieved at his death; but it is hardly probable he would have ever been really converted. Nevertheless, when on the point of death, his wife had him baptized, and his funeral was conducted with the rites of the Catholic Church. He died on the 2nd of June 1881.

The following are his most important works: his editions of Hippocrates (1839-1864), and of Pliny’s Natural History (1848-1860), with a translation of the later volumes (1859-1860), and Müller’s Manuel de physiologie (1851); his edition of the works of Armand Carrel, with notes (1854-1858); the Histoire de la langue française, a collection of magazine articles (1862); and his Dictionnaire de la langue française in four volumes (1851-1868). In the domain of science he must be noted his edition, with Charles Robin, of Nysten’s Dictionnaire de médecine, de chirurgie, &c. (1855); in that of philosophy, his Analyse raisonnée du cours de philosophie positive de M. A. Comte (1842); and his Applications de la philosophie positive au gouvernement (1842-1843), a notable parallel to Comte’s Conservation, révolution et positivisme (1852, 2nd ed. with supplement, 1879); Paroles de la philosophie positive (1859); Auguste Comte et la philosophie positive (1863); La Science au point de vue positiviste (1873); Fragment de philosophie et de sociologie comparatives (1876); and two interesting miscellaneous works, his Études et glanures (1880); La Vertu sur la mémoire d’Alexandre le grand (1865); Études sur les barbares et le moyen âge (1867); Médicine et médecins (1871); Littérature et histoire (1875); and Discours de réception à l’Académie française (1873).

For his life consult C. A. Sainte-Beuve, Notice sur M. Littre, sa vie et ses travaux (1863); and Nouveaux Lundis, vol. v.; also the notice by M. Durand-Greville in the Nouvelle Revue de August 1881; E. Caro, Littre et le positivisme (1885); and Pourtra, Discours de réception at the Academy, where he succeeded Littre, and a reply by E. Renan.

(L. M. S.)

LITURGY

(Low Lat. liutorgia; Gr. λειτουργία, a public servant), in the technical language of the Christian Church, the order for the celebration and administration of the Eucharist. In Eastern Christendom the Greek word λειτουργία is used in this sense exclusively, and in English-speaking countries the word “liturgy” has come to be used in a more popular sense to denote any or all of the various services of the Church, whether contained in separate volumes or bound up together in the form of a Book of Common Prayer. In this article the liturgy is treated in the former and stricter sense. (For the ancient Athenian λειτουργία, as forms of taxation, see Finance.)

In order to understand terms and references it will be convenient to give the tabular form the chief component parts of a liturgy, selecting the Liturgy of Rome as characteristic of Western, and that of Constantinople as characteristic of Eastern, Christendom; at the same time appending an explanation of some of the technical words which must be employed in enumerating those parts.

ORDER OF THE ROMAN LITURGY

Ordinary of the Mass.

1. Introit, or as it is always called in the Sarum rite, “Office,” a Psalm or part of a Psalm sung at the entry of the priest, or clergy and choir.

2. Kyrie eleison, ninefold, and sometimes lengthily farsed representing an older, now obsolete, litany.

3. Collect, i.e. the collect for the day.

4. Prophetic lesson, now obsolete, except on the Wednesday and Saturday Ember Days, Good Friday and Easter Even, and Wednesday after fourth and sixth Sundays in Lent.

5. Epistle.
6. Gradual. A few verses from the Psalms, the shrunken remainder of a whole Psalm.
7. Sequence. A hymn now obsolete except on Feast of the Seven Dolours, Easter, Pentecost, Corpus Christi and at Masses for the dead.
9. Creed.
11. Offertory. A verse or verses from the Psalms sung at the offering of the elements.
12. Secret. A prayer or prayers said at the conclusion of the Offertory.
13. Sæculum Corda. "Lift up your hearts" with following verses.
14. Preface. There are now ten proper or special prefaces and one common preface. In older missals they were extremely numerous, almost every Sunday and Holy-day having one assigned to it. Many of them were very beautiful. In older missals Nos. 13, 14 and 15 were sometimes arranged not as the concluding part of the Ordinary, but as the opening part of the Canon of the mass.
15. Sanctus, or Ternsanctus, or Triumphant Hymn, "Holy, Holy, Holy," &c., ending with the Benedictus "Blessed is he that cometh, &c.

Canons of the Mass.
1. Introductory prayer for acceptance. Te gigitur, &c.
2. Introduction for the living. Memento, Domine famulum, &c.
5. Recital of words of institution. Qui pridic quam pateretur, &c.
7. Invocation. A passage difficult of interpretation, but apparently meant to be equivalent to the Eastern Epiklesis or invocation of the Holy Ghost. Supplices te rogamus, &c.
8. Intercession for the dead. Memento eiam, Domine, famulum, &c.
9. Lord's Prayer, with a short introduction and the expansion of the last petition into a prayer known as the "Embolismus."
10. Fraction, i.e., breaking of the host into three parts, to symbolize the death and passion of Christ.
11. Communion, i.e., placing a small portion of the consecrated bread into the chalice symbolizing the reunion of Christ's body and soul at the resurrection.
12. Agnus Dei, i.e., a three-fold petition to the Lamb of God.
13. Pax, i.e., the kiss of peace. The ancient ritual of the Pax has become almost obsolete.
14. Three prayers, accompanying the Pax and preliminary to communion.
15. Communion of priest and people (if any), a short anthem called "Communio," being sung meanwhile.
17. Post-communion, i.e., a concluding prayer.
18. Dismissal. The Canon of the Mass strictly ends with No. 9; Nos. 10-18 being an appendix to it.

Liturgy of Constantinople
Mass of the Catechumens. After preparation and vesting.
1. The Deacon's Litany.
2. Three Anthems with accompanying prayers.
3. Little Entrance, i.e., ceremonial bringing in of the Book of the Gospel.
4. The Trisagion, i.e., an anthem with an accompanying prayer different from the Latin Sanctus or Ternsanctus
5. Epistle.
7. Bidding prayer.
8. Prayer for catechumens.
10. Spreading of the corporal.

Mass of the Faithful.

2. Cor. iii. 14. The invocation or Epiklesis.
3. Intercession for the dead.
4. Intercession for the living.
5. The Lord's Prayer.
6. Prayer of humble access (a) for people (b) for priest.
7. Elevation with the invitation " Holy things to holy people."
8. Fraction.
10. Thanksgiving.

In both these lists many interesting features of ceremonial, the use of incense, the infusion of warm water (Byzantine only), &c., have not been referred to. The lists must be regarded as skeletons only.

There are six main families or groups of liturgies, four of them being of Eastern and two of them of Western origin and use. They are known either by the names of the apostles with whom they are traditionally connected, or by the names of the countries or cities in which they have been or are still in use.

Group I. The Syrian Rite (St James).—The principal liturgies to be enumerated under this group are the Clementine liturgy, so called from being found in the eighth book of the Apostolic Constitutions, which claim in their title, though erroneously, to have been compiled by St Clement, the 1st-century bishop of Rome; the Greek liturgy of St James; the Syriac liturgy of St James. Sixty-four more liturgies of this group have existed, the majority being still in existence. Their titles are given in F. E. Brightman's Liturgies, Eastern and Western (1896), pp. lvi-lxi.

Group II. The Egyptian Rite (St Mark).—This group includes the Greek liturgies of St Mark, St Basil and St Gregory, and the Coptic liturgies of St Basil, St Gregory, St Cyril or St Mark; together with certain less known liturgies the titles of which are enumerated by Brightman (op. cit. pp. lxxii. lxxiv.). The liturgy of the Ethiopian church ordinances and the liturgy of the Abyssinian Jacobites, known as that of the Apostles, fall under this group.

Group III. The Persian Rite (SS. Adeaus and Maris).—This Nestorian rite is represented by the liturgy which bears the names of SS. Adeaus and Maris together with two others named after Theodore of Mopsuestia and Nestorius. This group has sometimes been called "East-Syrian." The titles of three more of its now lost liturgies have been preserved, namely those of Narses, Barsumas and Diodorus of Tarsus. The liturgy of the Christians of St Thomas, on the Malabar coast of India, formerly belonged to this group, but it was almost completely assimilated to the Roman liturgy by Portuguese Jesuits at the synod of Diamper in 1599.

Group IV. The Byzantine Rite.—The Greek liturgies of St Chrysostom, St Basil and St Gregory Dialogus, or The Pre-sanctified, also extant in other languages, are the living representatives of this rite. The Greek liturgy of St Peter is classified under this group, but it is merely the Roman canon of the Mass &c., inserted in a Byzantine framework, and seems to have been used at one time by some Greek communities in Italy. To this group also belongs the Armenian liturgy, of which ten different forms have existed in addition to the liturgy now in general use named after St Athanasius. We now come to the two western groups of liturgies, which more nearly concern the Latin-speaking nations of Europe, and which, therefore, must be treated of more fully.

Group V. The Hispano-Gallican Rite (St John).—This group of Latin liturgies, which once prevailed very widely in Western Europe, has been almost universally superseded by the liturgy of the Church of Rome. Where it survives, it has been more or less assimilated to the Roman pattern. It prevailed once throughout Spain, France, northern Italy, Great Britain and Ireland. The term "Ephesine" has been applied to this group or family of liturgies, chiefly by English liturgiologists, and the names of St John and of Ephesus, his place of residence, have been pressed into service in support of a theory of Ephesine origin, which, however, lacks proof and may now be regarded as a discarded hypothesis. Other theories represent the Gallican to be a survival of the original Roman liturgy, or as an importation
LITURGY

into Western Europe from the east through a Milanese channel. The latter is Duchesne's theory (Christian Worship, London, 1904, 2nd ed., p. 94).

We must be content with mentioning these theories without attempting to discuss them. The chief traces of oriental influence and affinity lie in the following points: (1) the omission of pronunciations made by the deacon, including that of "Silentium facit" before the epistle (Migne, Pat. Lat. tom. lxxvii. col. 534); (2) the presence of a third lesson preceding the epistle, taken from the Old Testament; (3) the occasional presence of "Ikténus" or deacon's litany; (4) the position of the kiss of peace at an early point in the service, before the canon, instead of the Roman position after consecration; (5) the exclamatory "Sancta sanctissima" in the Mozarabic rite, being the counterpart of the Eastern "Fathers" in the Gallican; (6) traces of the presence of the "Epiklesis" that is to say, the invocation of the Holy Spirit, in its Eastern position after the words of institution, in as the prayer styled the Post-pride in the Mozarabic rite, the second Sunday after the octave of the Epiphany. "We beseech thee that thou wouldest sanctify this oblation with the permixture of thy Spirit, and conform it with full transformation into the body and blood of our Lord Jesus Christ (Migne, Pat. Lat. tom. lxxvii. col. 258), that may have had thought variability of its parts, and the immense number of its proper prefaces, ally it to the Western family of liturgies.

We proceed now to give a more detailed account of the chief liturgies of this group.

1. The Mozarabic Liturgy.—This was the national liturgy of the Spanish church till the close of the 11th century, when the Roman liturgy was forced upon it. Its use, however, lingered on, till in the 16th century Cardinal Jimenes, anxious to prevent its becoming quite obsolete, had its books restored and printed, and founded a college of priests at Toledo to perpetuate its use. It survives now only in several churches in Toledo and in a chapel at Saragossa, and even there not without certain Roman modifications of its original text and ritual. Its date and origin, like the date and origin of all existing liturgies, are uncertain, and enveloped in the mists of antiquity. It is not derived from the present Roman liturgy. Its whole structure, as well as its separate details disprove such a parentage, and therefore it is strange to find St Isidore of Seville (Lib. de Eclesies. Offic. ii. 7) attributing it to St Peter. No proof is adduced, and the only value which can be placed upon such an unsupported assertion is that it shows that a very high and even apostolic antiquity was claimed for it. A theory, originating with Piccolomini, that it may have had thought by the Goths from Constantinople when they invaded Spain, is as improbable as it is unproved. It may have been derived from Gaul. The Gallican sister stood to it in the relation of twin-sister, if it could not have derived it from her. The resemblance was so great that when Charles the Bald (843-877) wished to get some idea of the character of the already obsolete Gallican rite, he sent to Toledo for some Spanish priests to perform Mass according to the Mozarabic rite in his chapel of Paris. The resemblance is so great that the Mozarabic missionaries. Christianity existed in Spain from the earliest times. Probably St Paul travelled there (Rom. xv. 24). It may be at least conjectured that its liturgy was Pauline rather than Petrine or Johannine.

2. Gallican Liturgy.—This was the ancient and national liturgy of the church in France till the commencement of the 9th century, when it was suppressed by order of Charlemagne, who had the episcopal office of the archbishop of Milan to everywhere substituted in its place. All traces of its survival for a time have been lost until three Gallican sacramentaries were discovered. They were published by Thomasius in 1680 under the titles of Missale Gothicum, Missale Gallicum and Missale Francorum, and a fourth was discovered and published by Mabillon in 1689 under the title of Missale Gallicanum. Fragmentary discoveries have been made since. More discovered fragments of eleven Gallican masques and published them at Carlsruhe in 1839. Other fragments from the library at St Gall have been published by Bunsen (Analecta Ante-Nicaeni, ii. 263-266, and from the Ambrosian library at Milan by Cardinal Mai (Script. Vet. Lat. Coll. iii. 2. 247). A single page was discovered in Conville and Ciaus College, Cambridge, published in Zeitschrift für Kath. Theologie, vi. 357.

These documents, illustrated by early Gallican canons, and by allusions in the writings of Sulpicius Severus, Cassian of Arles, Gregory of Tours, Germanus of Paris and other authors, enable us to reconstruct the greater part of this liturgy. The previously enumerated signs of Eastern origin and influence are found here as well as in the Mozarabic liturgy, together with certain other more or less minute peculiarities, which would be of interest to professed liturgiologists, but which we must not pause to specify here. They are the origin of the Epheusnene theory that the Gallican liturgy was introduced into use by Irenaeus, bishop of Lyons (c. 130-200) who had learned it in the East from St Polycarp, the disciple of the apostle St John.

3. Ambrosian Liturgy.—Considerable variety of opinion has existed among liturgical writers as to the proper classification of the "Ambrosian" or "Milanese" liturgy. If we are to accept it in its present form and to make the present position of the great intercession for quick and dead the test of its genuen, then we must classify it as "Petrine" and consider it as a branch of the Roman family. If, on the other hand, we consider the important variations from the Roman liturgy which yet exist, and the traces of still more marked variation which confront us in the older printed and MS. copies of the Ambrosian rite, we shall detect in it an original member of the Hispano-Gallican group of liturgies, which for centuries underwent a gradual but ever-increasing assimilation to Rome. We know this as a matter of history, as well as a matter of inference from changes in the text itself. Charlemagne adopted the same policy towards the Milanese as towards the Gallican church. He carried off all the Ambrosian books that he could obtain, with the view of substituting Roman books in their place, but the completion of his intentions failed, partly through the attachment of the Lombards to their own rites, partly through the intercession of a Gallican bishop named Eugenius (Mabillon, Mus. Ital. tom. i. Pars. ii. p. 106). It has been asserted by Joseph Viccomes that this is an originally independent liturgy drawn up by St Barnabas, who first preached the Gospel at Milan (De Missae Rit. i. cap. xi. ii.), and this tradition is preserved in the title and proper preface for St Barnabas Day in the Ambrosian missal (Pamellus, Liturgicon, i. 385, 386), but it has never-been proved.

We can trace the following points in which the Ambrosian differs from the Roman liturgy, many of them exhibiting traces of Eastern influences. Some of them are no longer found in recent Ambrosian missals and only survive in earlier MSS. such as those published by Pamellus (Liturgicon, tom. i. p. 293), Muratori (Lit. Rom. Vet. i. 132) and Ceriani (in his edition, 1881, of an ancient MS. at Milan). (a) The prayer entitled "oratio super sibem nominem" corresponding to the prayer after the spreading of the corporal; (b) the proclamation of silence by the deacon before the epistle; (c) the litanies said after the Ingressa (Introit) on Sundays in Lent, closely resembling the Greek Ektene; (d) varying forms of introduction to the Lord's Prayer, in Coena Domini, or Introits (i. 132) in Basil's edition; (e) the incorporation of passages in the prayer of consecration which are not part of the Roman canons and one of which at least corresponds in import and position though not in words to the Greek Invocation: "Tuam vero, omni potenti Pater, filius, et spiritui sancto; &c. (lb. p. 116); (f) the survival of a distinctly Gallican formula of consecration in the Post-sanctus, "in Sabbato Sancto." Vere sanctus, vere benedictus Dominus noster, &c. (lb. p. 125); (g) the varying nomenclature of the Sundays after Pentecost; (h) the position of the fraction or ritual breaking of bread before the Lord's Prayer; (i) the omission of the second oblation after the words of institution (Muratori, Lit. Rom. Vet. i. 133); (k) a third section or Prophethia from the Old Testament Lit. Rom. Vet. i. 133; (l) the prohibitory of the Litanies and the formulae accompanying their reception (Pamellus, Liturgicon, i. 297); (m) the position of the aubin of the hands in the middle of the canon just before the words of institution; (o) the omission of the "oratio super populum," which corresponds in matter but not in name to the collect for the day, before the Gloria in Excelsis.

4. Celtic Liturgy.—We postpone the consideration of this liturgy till after we have treated of the next main group.

VI. The Roman Rite (St Peter).—There is only one liturgy to be enumerated under this group, viz. the present liturgy of the Church of Rome which, though originally local in character and circumcised in use, has come to be nearly co-extensive with the Roman Catholic Church, sometimes superseding earlier national liturgies, as in Gaul and Spain, sometimes incorporating more or less of the ancient ritual of a country into itself and producing from such incorporation a sub-class of distinct Uses, as in England, France and elsewhere. Even these subordinate Uses have for the most part become, or are rapidly becoming, obsolete.
LITURGY

The date, origin and early history of the Roman liturgy are obscure. The first Christians at Rome were a Greek-speaking community, and their liturgy must have been Greek, and is possibly represented in the so-called Clementine liturgy. But the date when such a state of things ceased, when and by whom the present Latin liturgy was composed, whether it is an original composition, or, as its structure seems to imply, a survival of some intermediate form of liturgy—all these are questions which are waiting for solution.

One MS, exists which has been claimed to represent the Roman liturgy as it existed in the time of Leo I. (400-451). It was discovered at Verona by Bianchini in 1735, and assigned by him to the 8th century and is known as the Codex Latinus or Liberianum. However, this claim is not generally accepted, and there is the text and internal evidence which the MS. itself affords. The question is discussed at some length by Muratori (Litt. Rom. Vet. tom. i. cap. i. col. 16).

A MS. of the 7th or 8th century was found at Rome by Thomasius and published by him in 1680 under the title of Sacramentarium Galensanum. But this was written in French, and it is certain not a pure Galenian manuscript and therefore there is historical evidence of Pope Gelasius I. (492-496) having made some changes in the Roman liturgy, and although MSS. have been published which are claimed to represent the title of Gelasian, we have neither nor are likely to have any contemporary copy of the reform of the liturgy in that pope's time. The most modern and the best edition of the Gelasian Sacramentary is that by H. A. Wilson (Oxford, 1894).

The large number of MSS. of this group are copies of the Gregorian Sacramentary, that is to say, MSS. representing or purporting to represent, the state of Roman liturgy in the days of Pope Gregory the Great. But they cannot be accepted as certain evidence for the following reasons: not one of them was written earlier than the 9th century, not one of them was written in Italy, but every one north of the Alps; every one contains internal evidence of a post-Gregorian date in the shape of masses for the repose or for the intercession of St Gregory and in various other ways.

The Roman liturgy seems to have been introduced into England in the 7th century, in France in the 9th and into Spain in the 11th century, although it was known in both France and Spain some extent before these dates. In France certain features of the service and certain points in the ritual of the ancient national liturgy became interwoven with its text and formed those many varying medieval Gallican Uses which are associated with the names of different French sees.

The chief distinguishing characteristics of the Roman rite are these: (a) the position of the great intercession for quick and dead within the canon, the commemoration of the living being placed just before and the commemoration of the departed just after the words of institution; (b) the absence of an “Epiklesis” or invocation of the Holy Ghost upon the elements; (c) the position of the “Pax” or “Kiss of Peace after the consecration” and before the communion, whereas in other liturgies it occurs at a much earlier point in the service.

Liturgies of the British Islands.

Period I. The Celtic Church.—Until recently almost nothing was known of the character of the liturgical service of the Celtic church which existed in these islands before the Anglo-Saxon Conquest, and continued to exist in Ireland, Scotland, Wales and Cornwall for considerable though varying periods of time after that event. But in recent times a good deal of light has been thrown on the subject, partly by the publication or republication of the few genuine works of Patrick, Columba, Columbanus, Aidan and other Celtic saints; partly by the discovery of liturgical remains in the Scottish Book of Deer and in the Irish Books of Dimna and Mulling and the Stowe Missal, &c.; partly by the publication of medieval Irish compilations, such as the Lobair Brecc, Liber Hymnorum, Martyrology of Oengus, &c.; which contain ecclesiastical calendars, legends, treatises, &c., of considerable but very varying antiquity. The evidence collected from these sources is sufficient to prove that the liturgy of the Celtic church was of the Gallican type. In central England, the churches, with everything belonging to them, were destroyed by the heathen invaders at the close of the 5th century; but the Celtic church in the remotest parts of England, as well as in the neighbouring kingdoms of Scotland and Ireland, retained its independence for centuries afterwards.

A examination of its few extant service-books and fragments of service-books yields the following evidence of the Gallican origin and character of the Celtic liturgy: (a) the presence of collects and anthems which occur in the Gallican or Mozarabic but not in the Roman liturgy; (b) various formulae of thanksgiving after communion; (c) frequent biddings or addresses to the people in the form of Gallican Praefationes; (d) the Gallican form of consecration, being a prayer called “Post-Sanctus” leading up to the words of institution; (e) the complicated rite of “fraction” or “the breaking of bread,” as described in the Irish treatise at the end of the Slowe Missal, finds its only counterpart in the elaborate ceremonial of the Mozarabic church; (f) the presence of the Gallican ceremonial of Pedilantium or “Washing of feet” in the earliest Irish baptismal office.

For a further description of these and other features which are characteristic of or peculiar to the Celtic liturgy the reader is referred to F. E. Warren’s Liturgy and Ritual of the Celtic Church (Oxford, 1881).

Period II. The Anglo-Saxon Church.—We find ourselves here on firmer ground, and can speak with certainty as to the nature of the liturgy of the English church after the beginning of the 7th century. Information is drawn from liturgical allusions in the extant canons of numerous councils, from the voluminous writings of Bede, Alcuin and many other ecclesiastical authors of the Anglo-Saxon period, and above all from a considerable number of service-books written in England before the Norman Conquest. Three of these books are missals of more or less completeness: (1) the Leofric Missal, a composite 10th-11th century MS. presented to the cathedral of Exeter by Leofric, the first bishop of that see (1046-1072), now in the Bodleian library at Oxford, edited by F. E. Warren (Oxford, 1883); (2) the missal of Robert of Jumièges, archbishop of Canterbury (1051-1052), written probably at Winchester and presented by Archbishop Robert to his old monastery of Jumièges in the neighbourhood of Rouen, in the public library of which it now lies; edited by H. A. Wilson (London, 1896); (3) the Red Book of Derby, a MS. Missal of the second half of the 11th century, now in the library of Corpus Christi College, Cambridge.

A perusal of these volumes proves what we should have expected a priori, that the Roman liturgy was in use in the Anglo-Saxon church. This was the case from the very first. That church owed its foundations to a Roman pontiff, and to Roman missionaries, who brought, as we are told by Bede, their native liturgical codices with them (Hist. Eccles. lib. ii. cap. 18). Accordingly, when we speak of an Anglo-Saxon missal, we mean a Roman missal only exhibiting one or more of the following features, which would differentiate it from an Italian missal of the same century. (a) Rubrics and other entries of a miscellaneous character written in the vernacular language of the country. (b) The commemoration of national or local saints in the calendar, in the canon of the mass and in the litanies which occur for use on Easter Even and in the baptismal offices. (c) The presence of a few special masses in honour of those local saints, together with a certain number of collects of a necessarily local character, for the rulers of the country, for its natural produce, &c. (d) The addition of certain peculiarities of liturgical structure and arrangement interpolated into the otherwise purely Roman service from an extraneous source. There are two noteworthy examples of this in Anglo-Saxon service-books. Every Sunday and festival and almost every vespers mass has its proper preface, although the number of such prefaces in the Gregorian sacramentary of the same period had been reduced to eight. There was a large but not quite equal number of triple episcopal benedictions to be pronounced by the bishop after the Lord’s Prayer and before the communion. This custom must either have been perpetuated from the old Celtic liturgy or directly derived from a Gallican source.

Period III. Anglo-Norman Church.—The influx of numerous foreigners, especially from Normandy and Lorraine, which
preceded, accompanied and followed the Conquest, and the occupation by them of the highest posts in church as well as state had a distinct effect on the liturgy of the English church. These foreign ecclesiastics brought with them a preference for and a habit of using certain features of the Gallican liturgy and ritual, which they succeeded in incorporating into the service-books of the church of England. One of the Norman prelates, Osmund, count of Séez, earl of Dorset, chancellor of England, and bishop of Salisbury (1078–1099), is credited with having undertaken the revision of the English service-books; and the missal which we know as the Sarum Missal, or the Missal associated with the Use of Sarum, practically became the liturgy of the English church. It was not only received into use in the province of Canterbury, but was largely adopted beyond those limits—in Ireland in the 12th and in various Scottish dioceses in the 12th and 13th centuries.

It would be beyond our scope here to give a complete list of the numerous and frequently minute differences between a medieval Sarum and the earlier Anglo-Saxon or contemporaneous English liturgy. They lie mainly in differences of collects and responses, variations of ritual on Candlemas, Ash Wednesday, and throughout Holy Week; the introduction of Latin prayers and the omission of the mass in certain compartments of Gallican character or origin; the wording of rubrics in the subjunctive or imperative tense; the peculiar "Peces in prostration"; the procession of Corpus Christi on Palm Sunday; the forms of ejection and reconciliation of penitents, &c. The varying episcopal benefactions as used in the Anglo-Saxon church were retained, but the numerous proper prefaces were discarded, the number being reduced to ten.

Besides the famous and far-spreading Use of Sarum, other uses, more local and less known, grew up in various English dioceses. In virtue of a recognized diocesan independence, bishops were able to regulate or alter their ritual, and to add special masses or commemorations for use within the limits of their jurisdiction. The better known and the more distinctive of these uses were those of York and Hereford, but we also find traces of or allusions to the Use of Bangor, Lichfield, Lincoln, Ripon, St. Asaph, St. Paul's, Wells and Winchester.

Service-books.—The Eucharistic service was contained in the volume called the Missal (q.v.), as the ordinary choir offices were contained in the volume known as the Breviary (q.v.). But besides these two volumes there were a large number of other service-books. Mr. Perfect lists twenty-five different volumes of liturgical use employed by the Western Church only. It must be understood, however, that many of these ninety-one names are synonyms (Mon., Rit. Eccles. Anglic., 1882, vol. 1, p. cxccx). The list might be increased by the possibility here only to name a few of the most important of them. (1) The Agenda is the same as the Manual, for which see below. (2) The Antiphonary contained the antiphons or anthems, sung at the canonical hours, and certain services of other parts of the service. (3) The Benefactions contained those triple episcopal benefactions previously described as used on Sundays and on the chief festivals throughout the year. (4) The Collectarium contained the collects for the season, together with a few other parts of the day offices. It was an incunabula breviary, and may be taken as a generic term to include the Homitarium, Pasional and other volumes. (5) The Missal was the name usually employed in England to denote the Ritual, which contained the Mass and Office and was made up of a handy book containing the litany, and which was especially useful for public worship or semi-public worship. (6) The Pontifical contained the orders of consecration, ordination, and such other rites as could, ordinarily, only be performed by a bishop. To these we must add a book which was also known as the Office of the Ass, and which was a handy book containing the masses of the laity, and which was very popular and often very highly embellished from the 11th to the 17th century. The Book of Hours, or Horae Breviaris Miseriae Virginis, also known as the Primer or Primer of Hours, contained the canonical hours, lucernaries, the penitential Psalms, and other devotions of a miscellaneous and private character. Detailed information about all these and other books is to be found in C. Wordsworth and H. Littlehales, The Old Service Books of the English Church.

The Eastern Church too possessed and still possesses numerous and voluminous service-books, of which the chief are the following: (1) The Euchologion, containing the liturgy itself with the remaining sacramental offices bound up in the same volume. (2) The Horologion, containing the unvarying portion of the Breviary. (3) The Menaion, being equivalent to a complete Breviary. (4) The Menologion or Martyrology. (5) The Octoechos and (6) the Paraklesis, containing Troparia and answering to the Western antiphonary. (7) The Pentecostarion, containing the services from Easter Day to All Saints' Day. (8) The Triodion, containing those from Septuagesima Sunday to Easter Even. (9) The Typikon is a general book of rules, corresponding to the Ordinale or the Pie of Western Christendom.

Period IV. The Reformed Church.—The Anglican liturgy of Reformation and post-Reformation times is described under the heading of Prayer, Book of Common, but a brief description may be added here of the liturgies of other reformed churches.

The Liturgy of the Scottish Episcopal Church.—This liturgy in its present form was compiled by Scottish bishops in 1636 and imposed—so we are told, not accurately, although it was imposed—upon the Scottish people by the royal authority of Charles I., in 1637. The prelates chiefly concerned in it were Spottiswood, bishop of Glasgow; Maxwell, bishop of Ross; Wedderburn, bishop of Dunblane; and Forbes, bishop of Edinburgh. Their work was approved and revised by certain members of the English episcopal synod—probably the bishop of St. Andrews, the bishops of London; and Wern, bishop of Ely. This liturgy has met with varied fortune and has passed through several editions. The present Scottish office dates from 1764. It is now used as an alternative form with the English communion office in the Scottish Episcopal Church.

The general arrangements of its parts approximate more closely to that of the first book of Edward VI. than to the present Anglican Book of Common Prayer. Among its noteworthy features are (a) the retention in its integrity and in its primitive position after the words of institution of the invocation of the Holy Spirit. That invocation runs thus: "And we most humbly beseech thee, O merciful Father, to hear us and of thy almighty goodness vouchsafe to bless and sanctify with thy word and Holy Spirit these thy gifts and creatures of bread and wine that they may become the body and blood of thy most dearly beloved Son" (edt. 1764). This kind of petition thus placed is found in the Eastern but not in the Roman or Anglican liturgies. (b) The reservation of the sacrament is permitted, by traditional usage, for the purpose of communicating the absent sick. (c) The morning and evening offices of the communicants are fixed at one or two instead of three or four.

For fuller information see Bishop J. Dowden, The Annotated Scottish Communion Service (Edinburgh, 1884).

American Liturgy.—The Prayer Book of the "protestant Episcopal Church" in America was adopted by the general convention of the American church in 1789. It is substantially the same as the English Book of Common Prayer, but among important variations we may name the following: (a) The arrangement and wording of the order for Holy Communion rather resembles that of the Scottish than that of the English liturgy, especially in the position of the oblation and invocation immediately after the words of institution. (b) The Magnificat, Nunc dimittis and greater part of Benedictus are not included in the liturgy, but these were reinstated among the changes made in the Prayer Book in 1890. (c) Ten selections of Psalms are included for use as alternatives for the Psalms of the day. (d) Gloria in excelsis is allowed as a substitute for Gloria Patri at the end of the Psalms at morning and evening prayer. In addition to these there are many more both important and unimportant variations from the English Book of Common Prayer.

The Irish Prayer Book.—The Prayer Book in use in the Irish portion of the United Church of England and Ireland was the Anglican Book of Common Prayer, but after the disestablishment of the Irish church several changes were introduced into it by a synod held at Dublin in 1870. These changes included such important points as: (a) the excision of all lessons from the Apocrypha, (b) the rubric ordering the recitation of the Athanasian Creed, (c) of the rubric ordering the vestments of the second year of Edward VI., (d) of the form of absolution in the office for the visitation of the sick, (e) the addition to the
Catechism of a question and answer bringing out more clearly the spiritual character of the real presence.

The Presbyterian Church.—The Presbyterian churches of Scotland at present possess no liturgy properly so called. Certain general rules for the conduct of divine service are contained in the "Directory for the Public Worship of God" agreed upon by the assembly of divines at Westminster, with the assistance of commissioners from the Church of Scotland, approved and established by an act of the general assembly, and by an act of parliament, both in 1645. In 1554 John Knox had drawn up an order of liturgy closely modelled on the Genevan pattern for the use of the English congregation to which he was then ministering at Frankfort. On his return to Scotland this form of liturgy was adopted by an act of the general assembly in 1560 and became the established form of worship in the Presbyterian church until the year 1689. After this time Worship took its place. Herein regulations are laid down for the public worship, for the reading of Scripture and for extempore prayer before and after the sermon, and in the administration of the sacrament of baptism and the Lord’s Supper, for the solemnization of marriage, visitation of the sick and burial of the dead, for the observance of days of public fasting and public thanksgiving, together with a form of ordination and a directory for family worship. In all these cases, though the general terms of the prayer are frequently indicated, the wording of it is left to the discretion of the minister, with these exceptions: At the act of baptism this formula must be used—"I baptize thee in the name of the Father, and of the Son, and of the Holy Ghost"; and for the Lord’s Supper these forms are suggested, but with liberty to the minister to use "other like, used by Christ or his apostles upon this occasion". "As the holy institution, command, and example of our blessed Saviour, Jesus Christ, I take this bread, and having given thanks, break it, and give it unto you. Take ye, eat ye; this is the body of Christ which is broken for you; do this in remembrance of him." And again "According to the institution, command and example of our Lord Jesus Christ, I take this cup and give it unto you; this cup is the New Testament in the blood of Christ, which is shed for the remission of the sins of many; drink ye all of it."

There is also an unvarying form of words directed to be used before the minister by the man to the woman, and by the woman to the man in the case of the solemnization of matrimony.

The form of words on all other occasions, including ordination, is left to the discretion of the officiating minister or of the presbytery.

European Protestant Churches. The Calvinistic Churches.—Rather more of the liturgical element in the shape of a set form of words enters into the service of the French and German Calvinistic Protestants. The Sunday morning service as drawn up by Calvin was a form of the public worship of Holy Scripture and the recitation of the ten commandments. Afterwards the minister, having given the people to accompany him, proceeded to a confession of sins and supplication for grace. Then one of the Psalms of David was sung. Then came the sermon, prefaced by an extempore prayer and concluding with the Lord’s Prayer, creed and benediction. The communion service began with an exhortation leading up to the apostles’ creed; then followed a long exhortation, after which the bread and wine were distributed to the people, who advanced in reverence and order, while a flourish of the horn was repeated. "A la fin," added Mahillon, he played a lateral staff trumpet and bell.”

The Lutheran Church.—Luther was far more conservative than the Reformed in the matter of church service. He was opposed to any substitution for the Latin language in the liturgy, and the old form and order of the Roman missal were closely followed, beginning with the Confesor, Introit, Kyrie eleison, still always sung in Greek, Gloria in excelsis Deo, &c. The text of this and other Lutheran services is given in "Aegae für christliche Gemeinden des Lutherschen Bekenntnisses" (Nördlingen, 1853). At the same time Luther was tolerant and expressed a hope that different portions of the Lutheran church would from time to time make such changes or adaptations in the order of service as might be found convenient. The Lutheran churches of northern Europe have not been slow to avail themselves of this advice and permission. Most of them have drawn up liturgies for their services, sometimes very slightly varying from the original, and considerable additions have been made up, so that the service of the present time is entirely different from the liturgies in use at the time of the Reformation. In Sweden, Norway, and Denmark the liturgy of the Reformation is still in use, but is supplemented by the introduction of the confessional element and the use of the homily. In Denmark and Norway the liturgy of the Reformation is still in use, but is supplemented by the introduction of the confessional element and the use of the homily. In Denmark and Norway the liturgy of the Reformation is still in use, but is supplemented by the introduction of the confessional element and the use of the homily. In Denmark and Norway the liturgy of the Reformation is still in use, but is supplemented by the introduction of the confessional element and the use of the homily. In Denmark and Norway the liturgy of the Reformation is still in use, but is supplemented by the introduction of the confessional element and the use of the homily.
by the Atlantic Coast Line, the Seaboard Air Line, the Live Oak, Perry & Gulf and the Florida railways. There are extensive areas of pine lands in the vicinity, and large quantities of sea-
lant cotton are produced in the county. Lumber and naval
stores are also important products. The first settlement on the
site of the city was made in 1865 by John Parsley, of Massa-
chusetts, who erected a large saw-mill here. Live Oak was
first incorporated as a town in 1874, and in 1903 was chartered
as a city.

LIVER (O. Eng. lifer; cf. cognate forms, Dutch lever, Ger.
Leber, Swed. lever, &c.; the O. H. Ger. forms are libara, liporu,
&c.; the Teut. word has been connected with Gr. ἱφρον and Lat.
jejus, in anatomy, a large reddish-brown digestive gland situated
in the upper and right part of the abdominal cavity. When
hardened in situ its shape is that of a right-angled, tri-
gle prism showing four surfaces—superior, anterior, inferior, posterior and right lateral which
represents the base of the prism. It weighs about three pounds on an adult's body.

Although the liver is a fairly solid organ, it is
plastic, and moulds itself to even hollow neighbouring
viscerca rather than they to it. The
superior surface is in contact with the diaphragm, but has
peritoneum between (see COELOM and SEROUS MEMBRANES). At its posterior margin the peri-
toneum of the great sac is reflected on to the
diaphragm to form the anterior layer of the coro-
nary ligament. Near the mid line of the body,
and at right angles to the last, another reflection, the
falciform ligament, runs forward, and the line of
attachment of this indicates the junction of the right
and left lobes of the liver. The anterior surface is
in contact with the diaphragm and the anterior
abdominal wall. The attachment of the falciform
ligament is continued down it. The posterior sur-
face is more complicated (see fig. 1); starting from
the right and working toward the left, a large
triangular area, uncovered by peritoneum and in
direct contact with the diaphragm, is seen. This is
bound on the left by the inferior vena cava,
which is sunk into a deep groove in the liver, and
into the upper part of this the hepatic veins open.
Just to the right of this and at the lower part of the
bare area is a triangular depression for the right suprare-
renal body. To the left of the vena cava is the
Spigelian lobe, which lies in front of the bodies of
the tenth and eleventh thoracic vertebrae, the lesser
sac of peritoneum, diaphragm and thoracic aorta
 intervening. To the left of the liver is the ductus venosus, and to the left of this again, the left
lobe, in which a broad shallow groove for the
oesophagus may usually be seen. Sometimes the left
lobe stretches as far as the left abdominal wall, but
more often it ends below the apex of the heart,
which is 3/4 in. to the left of the mid line of the
body. The relations of the lower surface can
only be understood if it is realized that it looks
backward and to the left as well as downward (see fig. 1).
Again starting from the right side, two impressions are seen;
the anterior one is for the hepatic flexure of the colon, and the
posterior for the upper part of the right kidney. To the left of
the colic impression is a smaller one for the second part of the
duodenum. Next comes the gall bladder, a pear-shaped bag,
the fundus of which is in front and below, the neck behind and
above. From the neck passes the cystic duct, which is often
twisted into the form of an S. To the left of the gall bladder is
the quadrato lobe, which is in contact with the pylorus of
the stomach. To the left of this is the left lobe of the liver, separated
from the quadrato lobe by the umbilical fissure in which lies
the round ligament of the liver, the remains of the umbilical vein
of the foetus. Sometimes this fissure is partly turned into
tunnel by a bridge of liver substance known as the pons hepatis.

The under surface of the left lobe is concave for the interior
surface of the stomach (see ALIMENTARY CANAL: Stomach
Chamber), while a convexity, known as the tuber omentale, fits
into the lesser curvature of that organ. The posterior boundary
of the quadrato lobe is the transverse fissure, which is little
more than an inch long and more than half an inch wide. This
fissure represents the hilum of the liver, and contains the right
and left hepatic ducts and the right and left branches of the
hepatic artery and portal vein, together with nerves and lymphatics,
the whole being enclosed in some condensed subperitoneal
tissue known as Glisson's capsule. Behind the transverse fissure
the lower end of the Spigelian lobe is seen as a knob called the
tuber papillare, and from the right of this a narrow bridge runs
forward and to the right to join the Spigelian lobe to the right

From A. Birmingham Cunningham's Text-book of Anatomy.

Fig. 1.—The Liver from below and behind, showing the whole of the visceral
surface and the posterior area of the parietal surface. The portal fissure has
been slightly opened up to show the vessels passing through it; the other fissures
are represented in their natural condition—closed. In this liver, which was
hardened in situ, the impressions of the succulations of the colon are distinctly
visible at the colic impression. The round ligament and the remains of the
ductus venosus are hidden in the depths of their fissures.

Portion of the liver enclosed in the capsule formed by the
peritoneum. The cut surface shows the layers of subperitoneal
fat and fibrous tissue, the triangular-shaped spaces covered
by the peritoneum, and the lesser sac. The liver is divided
into left and right lobes by the transverse fissure. The
portal fissure is open, showing the left and right hepatic
ducts, the ductus venosus, and the vessels of the liver. The
upper end of the liver is directed upward and to the right,
the lower end downward and to the left. The liver is
covered with a thin layer of peritoneum, which is
continuous with the diaphragm. The anterior surface
is smooth and slightly convex, while the posterior surface
is irregular and concave. The right lobe is larger than
the left, and the gall bladder lies in a shallow groove on
the right side. The liver is a soft, spongy organ, which
contains numerous blood vessels, nerves, and lymphatic
vessels. The liver is divided into lobules, which are
organized into functional units called hepatic acini.

The right and left hepatic ducts, while still in the transverse
fissure, unite into a single duct which joins the cystic duct from
the gall bladder at an acute angle. When these have united

liver and to shut off the transverse fissure from that for the vena
cava. This is the caudate lobe. The right surface of the liver is
covered with peritoneum and is in contact with the diaphragm,
outside which are the pleura and lower ribs. From its lower
margin the right lateral ligament is reflected on to the diaphragm.
A similar fold passes from the tip of the lobe as the left
lateral ligament, and both these are the lateral margins of the
coronary ligament. Sometimes, especially in women, a tongue-
shaped projection downward of the right lobe is found, known
as Riedel's lobe; it is of clinical interest as it may be mistaken
for a tumour or floating kidney (see C. H. Leaf, Proc. Anat.

The right and left hepatic ducts, while still in the transverse
fissure, unite into a single duct which joins the cystic duct from
the gall bladder at an acute angle. When these have united

The right and left hepatic ducts, while still in the transverse
fissure, unite into a single duct which joins the cystic duct from
the gall bladder at an acute angle. When these have united
the
duct is known as the common bile duct, and runs down to the second part of the duodenum (see ALIMENTARY CANAL).

Minute Structure of the Liver.—The liver is made up of an enormous number of lobules of a conical form (see Fig. 3). If the portal vein is followed from the transverse fissure, it will be seen to branch and rebranch until minute twigs called interlobular veins (fig. 2, i) ramify around the lobules. From these interlobular capillaries arise the centre of the lobule, forming a network among the polygonal hepatic cells. On reaching the core of the conical lobule they are collected into a central or intra lobular vein (fig. 2, c) which unites with other similar ones to form a sublobular vein (fig. 3). These eventually reach the hepatic radicles, and so the blood is conducted into the vena cava. In man the lobules are not distinctly separated one from the other, but in some animals, e.g. the pig, each one has a fibrous sheath, derived from Glisson’s capsule (fig. 3, c).

Embryology.—The liver first appears as an entodermal hollow longitudinal outgrowth from the duodenum into the ventral mesentery. The upper part of this forms the future liver, and grows up into the septum transversum from which the central part of the diaphragm is formed (see Diaphragm). The cephalic part of this primary diverticulum solid rods of cells called the hepatic cylinders grow out, and form a cellular network with the umbilical and vitelline veins. At first the liver is embedded in the septum transversum, but later the diaphragm and it is constricted off from the other, and soon the liver becomes very large and fills the greater part of the abdomen. In man it is proportionately much larger than in the adult, and forms one-eighth instead of one-fortieth of the body weight, the right and left lobes being nearly equal in size.

Comparative Anatomy.—In the Acrania (Amphioxus) the liver is probably represented by a single ventral diverticulum from the anterior end of the intestine, which has a hepatic portal circulation and secretes digestive fluid. In all the Craniata a solid liver is developed. In the adult lamprey among the Cyclostomata the liver undergoes retrogression, and the bile ducts and gall bladder disappear, though they are present in the larval form (Amphioxus). In fishes and amphibians the organ consists of right and left lobes, and a gall bladder is present. The supratentorial apparatus of the reptiles, but a cellular network of the ducts is found in snakes and to a less extent in crocodiles. In the Vertebrata (Monitors) the hepatic duct is also represented (see F. E. B. Proc. Zool. Soc., 1888, p. 105). In birds two lobes are also present, but in some of them, e.g. the pigeon, there is no gall-bladder.

In mammals Sir William Flower pointed out that a generalized type of liver exists, from which that of ungulates may be derived by suppression or fusion of lobes. The accompanying diagram of Flower (fig. 4) represents an ideal mammalian liver. It will be seen that the umbilical fissure (u) divides the organ into right and left halves, as in the lower vertebrates, but that the ventral part of each half is divided into a central and lateral lobe. Passing from right to left there are therefore: right lateral (rl), right central (rc), left central (lc), and left lateral (ll) lobes. The gall-bladder (g), when it is present, is always situated on the caudal surface or in the substance of the right central lobe. The Spigelian (i) and caudate lobes (c) belong to the right half of the liver, the latter being usually a leaf-shaped lobe attached by its stalk to the Spigelian, and having its blade flattened between the right lateral lobe and the right kidney. The vena cava (v) is always found to the right of the Spigelian lobe and dorsal to the stalk of the caudate. In tracing the lobulation of man’s liver back to the generalized type, it is evident at once that his quadrate lobe does not correspond to any liver-derived lobe, but is merely that part of the right central which lies between the gall bladder and the umbilical fissure. From a careful study of human variations (see A. Thomson, Journ. Anat. and Phys. vol. 33, p. 546) of the birth lobe, such as that of the gorilla, depicted by W. H. L. Duckworth (Morphology and Anthropology, Cambridge, 1904, p. 98), it is fairly clear that the human liver is formed, not by a suppression of any of the lobes of the generalized type, but by a fusion of those lobes and obliteration of certain fissures. This fusion is, probably correctly, attributed by Keith to the effect of pressure following the assumption of the erect position (Keith, Proc. Anat. Soc. of Brit. Britain, Journ. Anat. and Phys. vol. 33, p. xii.). The accompanying diagram (fig. 5) shows an abnormal human liver in the anatomical department of St Thomas’s Hospital which reproduces the generalized type. In its lobulation it is singularly like, in many details, that of the baboon (Papio maion) figured by G. Ruge (Morph. Jahrb., Bd. 35, p. 107); see F. G. Parsons, Proc. Anat. Soc. Feb. 1904, Journ. Anat. and Phys. vol. 33, p. xiv. Georg Ruge (Russische Formverhältnisse der Leber bei der Primaten) (Morph. Jahrb., Bd. 29 and 35) gives a critical study of the primate liver, and to this and other things suggests the recognition of the Spigelian and caudate lobes as parts of a single lobe, for which he proposes the name of lopus venae cavae. This doubtless would be an advantage morphologically, though for human descriptive anatomy the present nomenclature is not likely to be altered.

The gall-bladder is usually present in mammals, but is wanting in the odd-toed ungulates (Perissodactyla) and Procavia (Hyrax). In the giraffe it may be absent or present. The cecae and a few rodlets are also without it. In the otter the same curious network of bile ducts already recorded in the reptiles is seen (see P. H. Burne, Proc. Anat. Soc., Journ. Anat. and Phys. vol. 33, p. xii.). (F. G. P.)

Surgery of Liver and Gall-bladder.—Exposed as it is in the upper part of the abdomen, and being somewhat friable, the human liver is often torn or ruptured by blows or kicks, and the large blood-vessels being thus laid open, fatal haemorrhage...
into the belly-cavity may take place. The individual becomes faint, and the faintness keeps on increasing; and there are pain and tenderness in the liver-region. The right thing to do is to open the belly in the middle line, search for a wound in the liver and treat it by deep sutures, or by plugging it with gauze.

Cirrhosis of the Liver.—As the result of chronic irritation of the liver increased supplies of blood pass to it, and if the irritation is unduly prolonged inflammation is the result. The commonest causes of this chronic hepatitis are alcoholism and syphilis. The new fibrous tissue which is developed throughout the liver, as the result of the chronic inflammation, causes general enlargement of the liver with, perhaps, nausea, vomiting and jaundice. Later the new fibrous tissue undergoes contraction and the liver becomes smaller than natural. Blood then finds difficulty in passing through it, and, as a result, dropsy occurs in the belly (ascites). This may be relieved by tapping the cavity with a small hollow needle (Soutey’s trocar), or by passing into it a large sharp-pointed tube. This relieves the dropsy, but it does not cure the condition on which the dropsy depends. A surgical operation is sometimes undertaken with success for enabling the engorged veins to empty themselves into the blood-stream in a manner so as to avoid the liver-route.

Inflammation of the Liver (hepatitis) may also be caused by an attack of micro-organisms which have reached it through the veins coming from the large intestine, or through the main arteries. There are, of course, as the result, pain and tenderness, and there is often jaundice. The case should be treated by rest in bed, fomentations, calomel and saline aperients. But when the hepatitis is of septic origin, suppuration is likely to occur, the result being an hepatic abscess.

Hepatic Abscess is especially common in persons from the East who have recently undergone an attack of dysentery. In addition to the local pain and tenderness, there is a high temperature accompanied by shiverings or occasional rigors, the patient becoming daily more thin and miserable. Sometimes the abscess declares itself by a bulging at the surface, but if not an incision should be made through the belly-wall over the most tender spot, and a direct examination of the surface of the liver made. A bulging having been found, that part of the liver which apparently overlies the abscess should be stitched up to the sides of the opening made in the belly-wall, and should then be explored by a hollow needle. If pus being found, the abscess should be freely opened and drained. It is inadvisable to explore for a suspected abscess with a hollow needle without first opening the abdomen, as septic fluid might thus be enabled to leak out, and infect the general peritoneal cavity. If an hepatic abscess is inadvisably left to itself it may eventually discharge into the chest, lungs or belly, or it may establish a communication with a piece of intestine. The only safe way for an abscess to evacuate itself is on to the surface of the body.

Hepatic Cysts are often met with in the liver. They are due to a peculiar development of the eggs of the tape-worm of the dog, which have been received into the alimentary canal with infected water or uncooked vegetables, such as watercress. The embryo of the taenia echinococcus finds its way from the intestine or intestines, having escaped into a vein passing to the liver, and, settling itself in the liver, causes so much disturbance there that a capsule of inflammatory material forms around it. Inside this wall is the special covering of the embryo which shortly becomes distended with clear hydatid fluid. The cyst should be treated like a liver-abscess, by incision through the abdominal or thoracic wall, by circumferential suturing and by exploration and drainage.

Tumours of the Liver may be innocent or malignant. The most important of the former is the gumma of tertiary syphilis; this may steadily and completely disappear under the influence of iodide of potassium. The commonest form of malignant tumour is the result of the growth of cancerous elements which have been brought to the liver by the veins coming up from a primary focus of the large intestine. Active surgical treatment of such a tumour is out of the question. Fortunately it is, as a rule, painless.

The Gall-bladder may be ruptured by external violence, and if bile escapes from the rent in considerable quantities peritonitis will be set up, whether the bile contains septic germs or not. If, on opening the abdomen to find out what serious effects some severe injury has caused, the gall-bladder be found torn; the rent may be sewn up, or, if thought better, the gall-bladder may be removed. The peritoneal surfaces in the region of the liver should then be wiped clean, and the abdominal wound closed, except for the passage through it of a gauze drain.

Biliary concretions, known as gall stones, are apt to form in the gall-bladder. They are composed of crystals of bile-fat, cholesterol. Sometimes in the course of a post-mortem examination a gall-bladder is found packed full of gall-stones which, before life had caused no inconvenience and had given rise to no suspicion of their presence. In other cases gall-stones set up irritation in the gall-bladder which runs on to inflammation, and the gall-bladder being infected by septic germs from the intestine (bacilli coli) an abscess forms.

Abscess of the Gall-bladder gives rise to a painful, tender swelling near the cartilage of the ninth rib of the right side. If the abscess is allowed to take its course, adhesions may form around it and it may burst into the intestine or on to the surface of the abdomen, a biliary fistula remaining. Abscess in the gall-bladder being suspected, an incision should be made down to it, and, its covering having been stitched to the abdominal wall, the gall-bladder should be opened and drained. The presence of concretions in the gall-bladder may not only lead to the formation of abscess but also to invasion of the gall-bladder by cancer.

Stones in the gall-bladder should be removed by operation, and, as, if left, there is a great risk of their trying to escape with the bile into the intestine and thus causing a blockage of the common bile-duct, and perhaps a fatal leakage of bile into the peritoneum through a perforating ulcer of the duct. If before opening the gall-bladder the intecstine is stitched to the deepest part of the abdominal wound, the biliary fistula left as the result of the opening of the abscess will close in due course.

A gall-stone which has found its way into the intestine is large enough to block the bowels and give rise to intestinal obstruction which demands abdominal section.

A person who is of what used to be called a "biliary nature," should eat sparingly and plenty of vegetable. He should avoid fat and rich food, butter, pastry and sauces, and should drink no beer or wine—unless it be some very light French wine or Moselle. He should keep his bowels regular, or even loose, taking every morning a dose of sulphate of soda in a glass of hot water. A course at Contrexeville, Vichy or Carlsbad, Vichy may be helpful. It is helpful if drugs have any direct influence upon gall-stones, such as sulphate of soda, olive oil or oleate of soda. No reliance can be placed upon massage in producing the onward passage of a gall-stone from the gall-bladder. It is a point to note that cold helps, and that the situation might be not only distressing but harmful.

LIVERMORE, MARY ASHTON RICE (1821-1905), American reformer, was born in Boston, Massachusetts, on the 19th of December 1821. She studied at the female seminary at Charlestown, Mass.; taught French and Latin there, taught in a
plantation school in southern Virginia; and for three years conducted a school of her own in Duxbury, Mass. Upon returning from Virginia she had joined the abolitionists, and she took an active part in the Washingtonian temperance movement. In 1845 she married Daniel Parker Livemore (1819-1890), a Universalist clergyman. In 1857 they removed to Chicago, Illinois, where she assisted her husband in editing the religious weekly, The New Covenant (1857-1869). During the Civil War, as an associate member of the United States Sanitary Commission, and as an agent of its North-western branch, she organized many aid societies, contributed to the success of the North-western Sanitary Fair in Chicago in 1863, and visited army posts and hospitals. After the war she devoted herself to the promotion of women's suffrage and to temperance reform, founding in Chicago in 1869 The Agitator, which in 1870 was merged into the Woman's Journal (Boston), of which she was an associate editor until 1872. She died in Melrose, Mass. on the 23rd of May, 1880. She is survived by her husband, who resides at Chicago, Illinois, the Massachusetts and the American woman's suffrage associations, the Massachusetts Woman's Christian Temperance Union and the Woman's Congress, and a member of many other societies. She lectured in the United States, England and Scotland, contributed to magazines and wrote: The Children's Army (1842), temperance stories; Thirty Years Too Late (1848), a temperance story; A Mental Transformation (1848); Pen Pictures (1863), short stories; What Shall We Do With Our Daughters? and Other Lectures (1883); My Story of the War (1888); and The Story of My Life (1897). With Frances E. Willard, she edited A Woman of the Century: Biographical Sketches of Leading American Women (1893).

LIVERPOOL, EARLS OF. CHARLES JENKINSON, 1st earl of Liverpool (1759-1808), English statesman, eldest son of Colonel Charles Jenkinson (d. 1750) and grandson of Sir Robert Jenkinson, Bart., of Wale, Oxfordshire, was born at Winchester on the 16th of May 1750. The family was descended from Anthony Jenkinson (d. 1611), sea-captain, merchant and traveller, the first Englishman to penetrate into Central Asia. Charles was educated at Charterhouse school and University College, Oxford, where he graduated M.A. in 1752. In 1761 he entered parliament as member for Cockermouth and was made under-secretary of state by Lord Bute; he won the favour of George III., and when Bute retired Jenkinson became the leader of the "king's friends" in the House of Commons. In 1763 George Grenville appointed him joint secretary to the treasury; in 1766, after a short retirement, he became a lord of the admiralty and then a lord of the treasury in the Grafton administration; and from 1778 until the close of Lord North's ministry in 1782 he was secretary-at-war. From 1786 to 1801 he was president of the board of trade and chancellor of the duchy of Lancaster, and he was popularly regarded as enjoying the confidence of the king to a special degree. In 1772 Jenkinson became a privy councillor and vice-treasurer of Ireland, and in 1775 he purchased the lucrative sinecure of clerk of the pells in Ireland and became master of the mint. In 1786 he was created Baron Hawkesbury, and ten years later earl of Liverpool. He died in London on the 17th of December 1808. Liverpool was twice married: firstly to Amelia (d. 1770), daughter of William Watts, governor of Fort William, Bengal, and secondly to Catherine, daughter of Sir Cecil Bisshoff, Bart., and widow of Sir Charles Cope, Bart.; he had a son by each marriage. He wrote several political works, but except his Treatise on the Coins of the Realm (1805) these are without striking merits. They are, Dissertation on the establishment of a national and constitutional force in England independent of a standing army (1756); Discourse on the conduct of the government of Great Britain towards America in 1758, new edition, 1817; and Collection of Treatises between Great Britain and other states (1765).

Powers 1649-1783 (1785). His Coins of the Realm was reprinted by the Bank of England in 1886.

His son, ROBERT BANKS JENKINSON, 2nd earl (1790-1828), was educated at Charterhouse and at Christ Church, Oxford, where he had George Canning, afterwards his close political associate, for a contemporary. In 1796 he entered parliament as member for Appleby; he became master of the mint in 1799 and foreign secretary in Addington's administration in 1801, when he conducted the negotiations for the abortive treaty of Amiens. On the accession of Pitt to power in 1804, he obtained the home office, having in the previous year been elevated as Baron Hawkesbury to the House of Lords, where he acted as leader of the government. He declined the premiership on the death of Pitt in 1806, and remained out of office until Portland became prime minister in 1807, when he again became secretary of state for home affairs. In 1808 he succeeded his father as earl of Liverpool. In the ministry of Spencer Perceval (1809-1812) he was secretary for war and the colonies. After the assassination of Perceval in May 1812 he became prime minister, and retained office till compelled in February 1817 to resign by the illness (paralysis) which terminated his life on the 4th of December 1828.

The political career of the 2nd Lord Liverpool was of a negative character so far as legislation was concerned; but he held office in years of great danger and depression, during which he "kept order among his colleagues, composed their quarrels, and oiled the wheels to make it possible for the machinery of government to work" (Spencer Walpole). The energy of Castlereagh and Canning secured the success of the foreign policy of his cabinet, but in his home policy he was always retrograde. The introduction of the bill of pains and penalties against Queen Caroline greatly increased his unpopularity, originated by the severe measures of repression employed to quell the general distress, which had been created by the excessive taxation which followed the Napoleonic wars. Lord Liverpool was destitute of wide sympathies and of true political insight, and his resignation of office was followed almost immediately by the complete and permanent reversal of his domestic policy. He was twice married but had no children, and he was succeeded by his half-brother CHARLES CECIL COPE JENKINSON, 3rd earl (1784-1851), who left three daughters. The baronetcy then passed to a cousin, and the peerage became extinct. But in 1805 the earldom was revived in the person of the 3rd earl's grandson, CECIL GEORGE SAVILE FOILJAMBE (1846-1907), who had been a Liberal member of parliament from 1880 to 1892, and in 1893 was created Baron Hawkesbury. He was succeeded in 1907 by his son, Arthur (b.1879).

The life of the 2nd earl sees the anonymous Memoirs of the Public Life and Administration of Liverpool (1827); C. D. Yonge, Life and Administration of the 2nd Earl of Liverpool (1868); T. E. Kebbel, History of Toryism (1886); and Sir S. Walpole, History of England, vol. ii. (1890).

LIVERPOOL, a city, municipal, county and parliamentary borough, and seaport of Lancashire, England, 201 m. N.W. of London by rail, situated on the right bank of the estuary of the Mersey, the centre of the city being about 3 m. from the open sea. The form of the city is that of an irregular semicircle, having the base line formed by the docks and quays extending about 9 m. along the east bank of the estuary, which here runs nearly north and south, and varies in breadth from 1 to 2 m. On the north the city is partly bounded by the borough of Bootle, along the shore of which the line of docks is continued. The area of the city is 16,619 acres exclusive of water area. The population at the census of 1901 was 684,956; the estimated population in 1908 was 753,253; the birth-rate for 1907 was 31.7 and the death-rate 18.3; in 1908 the rateable value was £4,675,320.

The city lies on a continuous slope varying in gradient, but in the districts near the banks. Exposed to the western sea breezes, with a dry subsoil and excellent natural drainage, the site is naturally healthy. The old borough, lying between the pool, now completely obliterated, and the river, was a conglomeration of narrow alleys without any regard to sanitary provisions; and during the 16th and 17th centuries it was several times visited by plague. When the town expanded beyond its original limits,
and spread up the slopes beyond the pool, a better state of things began to exist. The older parts of the town have at successive periods been entirely taken down and renovated. The commercial part of the city is remarkable for the number of palatial houses, built chiefly of stone, among which the banks and insurance offices stand pre-éminently. The demand for cottages and of houses has been entirely taken down and renovated.

Parks.—The earliest public park, the Prince’s Park, was laid out in 1843 by private enterprise, and is owned by trustees, but is the outcome. It is fortunate in its situation, occupying the most central position in the town, and surrounded by an area sufficiently extensive to exhibit its proportions, an advantage which was accentuated in 1868 by the removal of St. John’s church, which previously prevented an uninterrupted view of the west side. The plan is simple. The centre is occupied by the great hall, 190 ft. in length, and, with the galleries, 87 ft. wide and 74 ft. high, covered with a solid vault in masonry. Attached to each end, and opening therefrom,
LIVERPOOL

806

are the law-courts. A corridor runs round the hall and the courts, communicating with the various accessory rooms. Externally the east front is faced with a fine portico of sixteen Corinthian columns about 60 ft. in height. An advanced portico of similar columns fronts the south end crowned with a pediment filled with sculpture. The style is Roman, but the refinement of the details is suggestive of the best period of Grecian art. The great hall is finished with polished granite columns, marble balustrades and pavements, polished bronze doors with foliated tracery. The fine organ was built by Messrs Willis of London, from the specification of Dr Samuel Wesley. Elmes having died in 1847 during the progress of the work, the building was completed by C. R. Cockerell, R.A.

Next to the public buildings belonging to the city, the most important is the exchange, forming three sides of a quadrangle on the north side of the town-hall. The town-hall was originally built in 1828, and an exchange with municipal offices, but the merchants preferred to meet in the open street themselves. This, with other circumstances, led to the erection of a new exchange, a building of considerable merit, which was begun in 1803 and opened in 1808. It had scarcely been in use for more than fifty years when it was found that the wants of commerce had outstripped the accommodation, and the structure was taken down to make room for the present building. The revenue buildings, begun in 1828 on the site of the original Liverpool dock, formerly combined the customs, inland revenue, post-office and dock board departments but are now only used by the two first named. It is a heavy structure, with three advanced porticoes in the Ilyssian Ionic style. Near by stands the sailors' home, a large building in the Elizabethan style. The Philharmonic Hall in Hope Street, with not much pretension externally, is one of the finest music rooms in the kingdom; it accommodates an audience of about 2,000.

The group of buildings forming the county sessions house, the free public library, museum, central technical school and gallery of art are finely situated on the slope to the north of St George's Hall. The library and gallery of art are separate buildings, connected by the circular reading-room in the middle. The latter possesses some features in construction worthy of note, having a circular floor 100 ft. in diameter without columns or any intermediate support, and a lecture-room underneath, amphitheatrical in form, with grades or benches hewn out of the solid rock. In 1884 the county sessions house just mentioned, adjoining the art gallery was opened for public business. In 1899 new post-office buildings in Victoria Street were completed. In 1907 two important additions were made to the buildings of Liverpool, the new offices of the dock board, built on the site of a portion of the Old George's dock, and the new cotton exchange, in Old Hall street. The fine mass of buildings which constitute the university and dock is completed, giving direct access from the landing stage to the London and North Western system.

Water Supply.—The original supply of water was from wells in the sandstone rock, but in 1847 an act was passed, under which extensive works were constructed at Rivington, about 25 m. distant, and a much larger supply was obtained. The vast increase of population led to further requirements, and in 1880 another act gave power to impound the waters of the Wyre, one of the affluents of the Mersey, for the town, and also the river, which is a temporary supply having been obtained a year earlier. The river, however, obtained power to impound the waters of the Conway and Marchant rivers, and to bring them into Lake Wyre, the main river being joined by many smaller streams. This was completed and opened by the owner of the London and North Western system.

Tramways.—The corporation in 1896 purchased the property, rights, powers and privileges of the Liverpool Electric Supply Company, and in the following year the undertaking of the Liverpool Tramway Company, which they formally took over in the autumn of the same year. Since that date a large and extended system of electric tramways has been laid down, which has led to a very considerable increase in the receipts and the number of passengers carried.

Administration of Justice.—The city has quarter-sessions for criminal cases, presided over by the recorder, and held eight times a year. At least two police courts sit daily, and more if required. One is presided over by the stipendiary magistrate and the other by the lay magistrates and the coroner. The court of passage is a very ancient institution, possibly dating from the foundation of the borough by King John, and intended for cases arising out of the internal jurisdiction. The court then has been confirmed and settled by parliament and is competent to try civil cases arising within the city to any amount. The mayor is ex-officio the judge, but the presiding judge is an assessor appointed by the sheriff and presides about five times a year. There is a Liverpool district registry of the chancery of the County Palatine of Lancaster which has concurrent jurisdiction with the high court (chancery division) within the hundred of Liverpool. There is a Liverpool county court and there is a Liverpool bankruptcy jurisdiction over the county court districts of St Helens, Widnes, Ormskirk and Southport, and admiralty jurisdiction over the same districts with the addition of Birkenhead, Chester, Runcorn and Burton on the River. The Roman Catholic

Ecclesiastical.—The see of Liverpool was created in 1880 under the act of 1879, by the authority of the ecclesiastical commissioners, an endowment fund of about £100,000 having been subscribed for the purpose. The see of Liverpool was created in 1819, but a temporary see of St Helens was formed into the see of Chester in 1837. The see of Liverpool contains the sees of Bangor and Chester and has jurisdiction over the Roman Catholic, many of the landed gentry belonging to old Roman Catholic families.

The charitable foundation is the Blue Cross Hospital, established in 1708, for orphans and fatherless children born within the borough. The original building, opened in 1718, is a quaint and characteristic specimen of the architecture of the period. It now contains two hundred and fifty boys and one hundred girls. It was opened in 1893, and in 1905 a junction was made with the Lancashire and Yorkshire railway by which passenger traffic between Southport and the Dingle has been established. In 1893 the Riverstate tram line at the Prince's dock was completed, giving direct access from the landing stage to the London and North Western system.

WALLIS & STEPHENS, Warrington.
Italian art numbering altogether about 180 pictures, collected at the beginning of the 19th century by William Roscoe, were deposited in the gallery. The Picton circular reading-room, and the rotunda lecture-room were built by the corporation and opened in 1829. Alterations were subsequently made until 1879. The building was practically doubled. The literary and philosophical society was established in 1812. The Royal Institution, established mainly through the efforts of Roscoe in 1817, possessed a fine gallery of early art, the North Art Gallery, and is the centre of the literary institutions of the town.

Education.—Sunday schools were founded for poor children in 1783, as the result of a town’s meeting. These were soon followed by day schools. The first trade school was inaugurated at 66 Seacombe Street in 1786. In 1826 the corporation resolved on erecting a rota

LIVERPOOL 807

large scale. Shipbuilding, in the early part of the 19th century, was active and prosperous, but has practically ceased. During the latter half of the 18th century and the beginning of the 19th, pottery and china manufacture flourished in Liverpool. John Sadler, a Liverpool manufacturer, was the inventor of printing on pottery, and during the early period of Josiah Wedgwood’s career all his goods which required printing had to be sent to Liverpool. A large establishment, called the Herculaneum Pottery, was founded in a suburb on the banks of the Mersey, but the trade has long disappeared. Litherland, the inventor of the lever watch, was a Liverpool manufacturer, and Liverpool-made watches have always been held in high estimation. There are several extensive sugar refineries and corn mills. The manufacture of tobacco, which was always carried on, has increased in later years. The cutting, blending, and preparing of crude tobacco have led to the erection of factories employing many hands. There are also large mills for oil-pressing and making making cake.

Docks.—The docks of the port of Liverpool on both sides of the Mersey are owned and managed by the same public trust, the Mersey Docks and Harbour Board. On the Liverpool side they extend along the margin of the estuary 63 m., of which 14 m. is in the borough of Bootle. The Birkenhead docks have not such a frontage, but they extend a long way backward. The water area of the Liverpool docks and basins is 418 acres, with a linear quayage of 27 m. The Birkenhead docks, including the great float of 120 acres, contain a water area of 165 acres, with a linear quayage of 93 m. The system of navigation was begun by the corporation of 1762. The dock system, constituted from the first a public trust, the corporation never having derived any direct revenue from them, though the common council of the borough were the trustees, and in the first instance formed the committee of management. Gradually the payers of dock rates on ships and goods acquired influence, and were introduced into the governing body, and ultimately, by an act of 1857, the corporation was superseded. The management is vested in the Mersey Docks and Harbour Board, consisting of twenty-eight members, four of whom are nominated by the Mersey Conservancy commissioners, who consist of the first lord of the Admiralty, the chancellor of the duchy of Lancaster and the president of the Board of Trade, and the rest elected by the payers of rates on ships and goods, of whom a register is kept and annually revised. The revenue is derived from tonnage rates on ships, dock rates on goods, town dues on goods, with various minor sources of income.

Down to 1843 the docks were confined to the Liverpool side of the Mersey. Several attempts made to establish docks in Cheshire had been frustrated by the Liverpool corporation, who bought up the land and kept it in their own hands. In 1843, however, a scheme for docks in Birkenhead was carried through which ultimately proved unsuccessful, and the enterprise was acquired in 1855 by Liverpool. The Birkenhead docks were for many years only partially used, but are now an important centre for corn-milling, the importation of foreign cattle and export trade to the East. In addition to the wet docks, there are in Liverpool fourteen graving docks and three in Birkenhead, besides a gridiron on the Liverpool side.

The first portion of the great landing stage, known as the Georges’ stage, was constructed in 1847, from the plans of Mr (afterwards Sir) William Cubitt, F.R.S. This was 500 ft. long. In 1857 the Prince’s stage, 1000 ft. long, was built to the north of the Georges’ stage and distant from it 500 ft. In 1874 the intervening space was filled up and the Georges’ stage reconstructed. The fabric had just been completed, and was waiting to be inaugurated, when on the 28th of July 1874 it was destroyed by fire. It was again constructed with improvements. In 1896 it was farther extended to the north, and its length is now 242 ft. and its breadth 80 ft. It is supported on floating pontoons about 300 m. long, connected with the river wall by eight bridges, besides the floating bridge for pedestrians of 230 m. long, 25 m. in width. The southern half is devoted to the traffic of the Mersey ferries, of which there are seven—New Brighton, Egremont, Seacombe, Birkenhead, Rock Ferry, New Ferry and Eastham. The northern half is used by ocean-going steamers and their tenders. The warehouses for storing produce form a prominent feature in the commercial part of the city. Down to 1841
LIVERPOOL

these were entirely in private hands, distributed as chance might direct, but in that year a determined effort was made to construct docks with warehouses on the margin of the quays. In this met with considerable opposition from those interested, and led to a municipal revolution, but the project was ultimately carried out in the construction of the Albert dock and warehouses, which were opened by Prince Albert in 1845. For general produce these warehouses are falling somewhat into disuse, but grain warehouses have been constructed by the dock board at Liverpool and Birkenhead, with machinery for discharging, elevating, distributing, drying and delivering. Warehouses for the storage of tobacco and wool have also been built by the board. The Stanley tobacco warehouse is the largest of its kind in the world, the area of its fourteen floors being some 36 acres.

Dredging operations at the bar of the Queen's channel, in the channel itself and at the landing stage enables the largest ocean liners to enter the river and approach the stage at practically all states of the tide. The dredging at the bar was begun as an experiment in September 1860 by two of the board's ordinary hopper barges of 500 tons capacity each fitted with centrifugal pumps. The result was favourable, and larger vessels have been introduced. Before dredging began the depth of water at dead low water of spring tides on the bar was only 11 ft.; now there is about 28 ft. under the same conditions. The space over which dredging has been carried on at the bar measures about 9000 ft. by 1250 ft., the latter being the width of the dredged cut or channel through the bar. Dredging has also taken place on shoals and projections of sand-banks in the main sea channels.

Municipality.—Under the Municipal Reform Act of 1835, the boundaries of the original borough were extended by the annexation of portions of the surrounding district, while further additions were made in 1895, 1902 and 1905. The city is divided into thirty-five wards with 103 councillors and 34 aldermen. In 1893 the title of mayor was raised to that of lord mayor. In 1885 the number of members of parliament was increased to nine by the creation of six new wards. The corporation of Liverpool has possessed from a very early period considerable landed property, the first grant having been made by Thomas, earl of Lancaster, in 1309. This land was originally of value only as a source of supply of turf for firing, but in modern times its capacity as building land has been a fruitful source of profit to the town. A large proportion of the southern district is held in freehold by the corporation and leased to tenants for terms of seventy-five years, renewable from time to time on a fixed scale of fines. There was formerly another source of income now cut off. The fee farm rents and town dues originally belonging to the crown were purchased from the Molyneux family in 1672 on a long lease, and subsequently in 1777 converted into a perpetuity. With the growth of the commerce of the port these dues enormously increased, and became a cause of great complaint by the shipping interest. In 1856 a bill was introduced into parliament, and passed, by which the town dues were transferred to the Mersey Docks and Harbour Board on payment of £1,300,000, which was applied in part to the liquidation of the bonded debt of the corporation, amounting to £1,250,000.

History.—During the Norse irruption of the 8th century colonies of Norsemen settled on both sides of the Mersey, as is hinted by the place-name of Wallasey. After the Conquest, the site of Liverpool formed part of the fee (feudum et Marsam) granted by the Conqueror to Roger de Poictiers, a member of the great family of Montgomery. Although Liverpool is not named in Domesday it is believed to have been one of the six berewicks dependent on the manor of West Derby therein mentioned. After various forfeitures and regnant from the crown, it was handed over by Henry II. to his falconer Warine. In a deed executed by King John, then earl of Mortain, about 1191, confirming the grant of this with other manors to Henry Fitzwarine, son of the former grantee, the name of Liverpool first occurs. Probably its most plausible derivation is from the Norse Hlithar-pollr, “the pool of the slopes,” the pool or inlet at the mouth of which the village grew up being surrounded by gently rising slopes. Another possible derivation is from the Prov. E. lever, the yellow flag or rush, A.S. laefcr.

After the partial conquest of Ireland by Strongbow, earl of Pembroke, under Henry II., the principal ports of communication were Bristol for the south and Chester for the north. The gradual silt ing up of the river Dee soon so obstructed the navigation as to render Chester unsuitable. A quay was then constructed at Shotwick, about 8 m. below Chester, with a castle to protect it from the incursions of the neighbouring Welsh; but a better site was sought and soon found. Into the tidal waters of the Mersey a small stream, fed by a peat moss on the elevated land to the eastward, ran from north-east to south-west, forming at its mouth an open pool or sea lake, of which many existed on both sides of the river. The triangular piece of land thus separated formed a promontory of red sandstone rock, rising in the centre about 50 ft. above the sea-level, sloping on three sides to the water. The pool was admirably adapted as a harbour for the vessels of that period, being well protected, and the tide rising from 15 to 21 ft. King John repurchased the manor from Henry Fitzwarine, giving him other lands in exchange. Here he founded a borough, and by letters patent dated at Winchester, 28th of August 1207, invited his subjects to take up burgages.

From the patent rolls and the sheriff’s accounts it appears that the first considerate use was made of Liverpool in the 13th century for shipping stores and reinforcements to Ireland and Wales. In 1229 a charter was granted by Henry III., authorizing the formation of a merchants’ gild, with hanse and other liberties and free customs, with freedom from toll throughout the kingdom. Charters were subsequently granted by successive monarchs down to the reign of William and Mary, which last was the governing charter to the date of the Municipal Reform Act (1835).

In 1850 the city was chartered by the municipal government as a borough, the corporation being transformed into a city by royal charter.

The crown revenues from the burgage rents and the royal customs were leased in fee-farm from time to time, sometimes to the corporation, at other times to private persons. The first lease was from Henry III., in 1229, at £10 per annum. In the same year the borough, with all its appurtenances, was bestowed on Ranulf, earl of Chester, from whom it passed to his brother-in-law, Lord de Ferrers, Earl of Derby, who seems to have built Liverpool castle between 1232 and 1237. His grandson, Robert de Ferrers, was implicated in the rising of Simon de Montfort and his lands were confiscated in 1266 when Liverpool passed into the hands of Edmund, earl of Lancaster. Ultimately Liverpool again became the property of the crown, when Henry IV. inherited it from his father John of Gaunt, duke of Lancaster. In 1628 Charles I., in great straits for means which were refused by parliament, offered for sale about a thousand manors, among which Liverpool was included. The portion containing Liverpool was purchased by certain merchants of London, who, in 1635, reconveyed the crown rights, including the fee-farm rent of £14, 6s. 8d., to Sir Richard Molyneux, then recently created Viscount Molyneux of Maryborough, for the sum of £450. In 1672 all these rights and interests were acquired by the corporation.

Apart from the national objects for which Liverpool was founded, its trade developed slowly. From £10 per annum, in the beginning of the 13th century, the crown revenues had increased towards the end of the 16th century, to £38; but when they underwent a decline. The black death passed over Liverpool about 1360, and carried off a large part of the population. The Wars of the Roses in the 15th century unsettled the north-western districts and retarded progress for at least a century. The crown revenues diminished from £38 to less than half that sum, and were finally leased at £14, 6s. 8d., at which they continued until the sale by Charles I. It is, however, not safe to conclude that the reduced fee-farm rent represents an equivalent decline in prosperity; the privileges conferred by the various leases differed widely and may account for much of the apparent discrepancy.

Liverpool sent no representatives to Simon de Montfort’s parliament in 1264, but to the first royal parliament, summoned in 1295, the borough sent two members, and again in 1307.
LIVERSEDGE—LIVERY COMPANIES

809

The writs of summons were then suspended for two centuries and a half. In 1547 Liverpool resumed the privilege of returning members. In 1588 the borough was represented by Francis Bacon, the philosopher and statesman. During the Civil War the town was fortified and garrisoned by the parliament. It sustained three sieges, and in 1644 was escaladed and taken by Prince Rupert with considerable slaughter.

The true rise of the commerce of Liverpool dates from the Restoration. Down to that period its population had been either stationary or retrogressive, probably never exceeding about 1000. Its trade was chiefly with Ireland, France and Spain, exporting fish and wool to the continent, and importing wines, iron and other commodities. The rise of the manufacturing industry of South Lancashire, and the opening of the American and West Indian trade, gave the first impulse to the progress which has since continued. By the end of the century the population had increased to 5000. In 1699 the town was constituted a parish distinct from Walton, to which it had previously been appertained. In 1700, the small existing harbour being found insufficient to accommodate the shipping, several schemes were propounded for its enlargement, which resulted in the construction of a wet dock closed with flood-gates impounding the water, so as to keep the vessels floating during the recess of the tide. This dock was the first of its kind. The name of the engineer was Thomas Steers.

About this date the merchants of Liverpool entered upon the slave trade, into which they were led by their connexion with the West Indies. In 1709 a single vessel of 30 tons burden made a venture from Liverpool and carried fifteen slaves across the Atlantic. In 1730, encouraged by parliament, Liverpool went heartily into the new trade. In 1751, fifty-three ships sailed from Liverpool for Africa, of 5334 tons in the aggregate. The ships sailed first to the west coast of Africa, where they shipped the slaves, and thence to the West India Islands, where the slaves were sold and the proceeds brought home to be worn to England. In 1765 the number of Liverpool slave ships had increased to eighty-six, carrying 24,200 slaves. By the end of the century five-sixths of the African trade centred in Liverpool. Just before its abolition in 1807 the number of Liverpool ships engaged in the traffic was 185, carrying 49,213 slaves in the year.

Another branch of maritime enterprise which attracted the attention of the merchants of Liverpool was privateering, which, during the latter half of the 18th century, was a favourite investment. After the outbreak of the Seven Years' War with France and Spain, in 1756, the commerce of Liverpool suffered severely, the French having overrun the narrow seas with privateers, and the premiums for insurance against sea risks rose to an amount almost prohibitive. The Liverpool merchants took a lesson from the enemy, and armed and sent out their ships as privateers. Some of the early expeditions proved very successful, almost the whole community rushed into privateering, with results of a very chequered character. When the War of Independence broke out in 1775 American privateers swarmed about the West India Islands, and crossing the Atlantic intercepted British commerce in the narrow seas. The Liverpool merchants again turned their attention to retaliation. Between August 1778 and April 1779, 120 privateers were fitted out in Liverpool, carrying 1986 guns and 8745 men.

See W. Enfield, Hist. of Liverpool (1773); J. Aikin, Forty Miles round Manchester (1795); T. Troughton, Hist. of Liverpool (1816); M. Ewing, Portfolio of Fragments relating to Hist. of Lancashire (1817); H. Smithers, Liverpool, its Commerce, &c. (1825); R. Syers, Hist. of Everton (1830); E. Baines, Hist. of County Palatine of Lancaster, vol. i. (1836); T. Baines, Hist. of Commerce and Town of Liverpool (1842); J. R. Brooke, Liverpool during the last quarter of 18th Century (1853); J. A. Picton, Memorials of Liverpool (2 vols., 1873); Ramsay Muir and Edith M. Platt, A History of Municipal Government in Liverpool (1906); Ramsay Muir, A History of Liverpool (1901) 13,080. The industries are chiefly the manufacture of woolen goods, the making of machinery, chemical manufactures and coal mining.

LIVERY, originally the provision of food, clothing, &c., to household servants. The word is an adaptation of the Anglo-French livrée, from livrer, to deliver (Late Lat. liberare, to set free, to serve, to give freely), in the special sense of distributing. In the sense of a fixed allowance of provender for horses, it survives now only in "livery-stable," i.e. an establishment where horses and carriages are kept or let out for hire. From the meaning of provision of food and clothing the word is applied to a uniform worn by the retainers and servants of a household. In the 15th century in England a badge, collar or other insignia, the "livery," was worn by all those who pledged themselves to support one of the great barons in return for his promise of "maintenance," i.e., of protection against enemies; thus arose the custom of "livery and maintenance," suppressed by Henry VII. The members of the London city companies wore a distinctive costume or "livery" whence the term "livery companies." In law, the term "livery" means "delivery," the legal handing of property into the possession of another; for "livery of seisin" see FEOFFMENT.

LIVERY COMPANIES, the name given to particular companies or societies in the city of London. They belong to a class of institutions which at one time were universal in Europe. In most other countries they have disappeared; in England, while their functions have wholly changed, the organization remains. The origin of the city companies is to be found in the craftgilds of the middle ages. The absence of a strong central authority accounts for the tendency of confederation in the beginning of modern societies. Artificial groups, formed in imitation of the family, discharged the duties which the family was no longer able, and the state was not yet able, to undertake. The inhabitants of towns were forced into the societies known as gild-merchants, which, as "Account of the Grocers' Company," showed the munificence of their members, became exclusive, and so caused the growth of similar societies among excluded citizens. The craftgilds were such societies, composed of handicraftsmen, which entered upon a struggle with the earlier gilds and finally defeated them.

The circumstances and results of the struggle were of much the same character in England and on the continent. In London the victory of the crafts is decisively marked by the ordinance of the time of Edward II., which required every citizen to be a member of some trade or mystery, and by another ordinance in 1375 which transferred the right of election of corporate officers (including members of parliament) from the ward-representatives to the trading companies. Henceforward, and for many years, the companies engrossed political and municipal power in the city of London.

The trading fraternities assumed generally the character of corporations in the reign of Edward III. Many of them had been described before, but their privileges, hitherto exercised only on sufferance and by payment of their terms, were now confirmed by letters patent. Edward III. himself became a member of the fraternity of Linen Armourers, or Merchant Taylors, and other distinguished persons followed his example. From this time they are called livery companies, "from now generally assuming a distinctive dress or livery." The origin of the Grocers' Company is thus described: "Twenty-two persons, carrying on the business of pepperers in Soper's Lane, Cheapside, agree to meet together, to a dinner, at the Abbot of Bury's, St Mary Axe, and commit the particulars of their formation into a trading society to writing. They elect after dinner two persons of the company so assembled—Roger Osekyn and Lawrence de Halifay— as their first governors or wardens, appointing, at the same time, in conformity with the pious custom of the age, a priest or chaplain to celebrate divine offices for their souls. . . ." "The Grocers' Company" is quoted in Herbert's "Twelve Great Livery Companies, 1836, i. 43.

The religious observances and the common feasts were characteristic features of those institutions. They were therefore not merely trade unions in the current meaning of that phrase, but
may rather be described as forms of industrial self-government, the basis of union being the membership of a common trade, and the authority of the society extending to the general welfare, spiritual and temporal, of its members. It must be remembered that they flourished at a time when the separate interests of master and servant had not yet been created; and, indeed, when that fundamental division of interests arose, the companies gradually lost their functions in the regulation of industry. The fact that the craftsmen were a homogenous order will account for the wide authority claimed by their societies, and the important public powers which were conceded to them. In the regulation of trade they possessed extensive powers. They required every one carrying on the trade to join the company. In 1363, in answer to a remonstrance against the mischief caused by the merchants called grocers who engrossed all manner of merchandise vendable, and who suddenly raised the prices of such merchandise within the realm, it was enacted that all artificers and people of mysteries shall each choose his own mystery before next Candlemas, and that, having so chosen it, he shall henceforth use no other. L. Brentano (On Guilds) holds that it is wrong to represent such regulations as monopolistic, inasmuch as there was no question whatever of a monopoly in that time nor until the degeneration of the craftgilds into limited corporations of capitalists. In the regulation of trade the right of search was an important instrument. The wardens of the grocers are to "assayen weights, powders, confections, platers, oynments and all other things belonging to the same craft." The goldsmiths had the assay of metals, the fishmongers the oversight of fish, the vintners the tasting of wine, &c.

The companies enforced their regulations on their members by force. Many of their ordinances looked to the domestic affairs and private conduct of the members. The grocers ordain that no man of the fraternitie take his neighbour's house y' is of the same fraternitie, or enhance the rent against the will of the foresaid neighbour." Perjury is to be punished by the wardens and society with such correction as that other men of the fellowship may be warned thereby. Members reduced to poverty by adventures on the sea, increased price of goods, borrowing and pledging, or any other misfortune, are to be assisted "out of the common money, according to his situation, if he could not do without."

Following what appears to be the natural law of their being, the companies gradually lost their industrial character. The course of decay would seem to have been the following. The capitalists gradually assumed the lead in the various societies, the richer members engrossed the power and the companies tended to become hereditary and exclusive. Persons might be members who had nothing to do with the craft, and the rise of great capitalists and the development of competition in trade made the regulation of industry by means of companies no longer possible. For an account of the "degeneration of craftgilds" a general reference may be made to Brentano, On Guilds (1870), and C. Gross, The Guild Merchant (2 vols., 1860). The usurpation of power on the part of the richer members was not the only effect of the growth of one guild over the other. A pamphlet on the Clothworkers' Company, published in 1640, which asserts that "the commonalty" in the old charters meant, not the whole guild, but only the masters, wardens and assistants. Herbert records a dispute in the Goldsmiths' Company in 1520. The mode of electing officers, and the system of management generally, was challenged by three members who called themselves "artificers, poor men of the craft of goldsmiths." The company, or rather, the wardens, the assistants and livery presented a petition to the lord mayor, which was answered by the discontented craftsmen. The dispute was carried into the court of chancery and the star chamber. The artificers accused the company of subverting their grants, misappropriating the funds and changing the constitution of the society, and they complained of this being done by the usurpation of persons who "were but merchant goldsmiths, and had but little knowledge in the science." In 1531 the three complainants were expelled from the company, and then the dispute seems to have ended. In the last stage of the companies the members have ceased to have any connexion with the trades, and in most cases their regulative functions have disappeared. The one characteristic which has clung to them throughout is that of owners of property and managers of charitable trusts. The connexion between the companies and the municipality is shortly as follows. The ordinance of Edward II. required freemen of the city to be members of one or other of the companies. By the ordinance of 49 Edw. III. (1375), the trading companies were to nominate the members of common council, and the persons so nominated alone were to attend both at common councils and at elections. An ordinance in 7 Richard II. (1383) restored the elections of common councilmen to the wards, but corporate officers and representatives in parliament were elected by a convention summoned by the lord mayor from the nominees of the companies. An act of common council in 7 Edw. IV. (1467) appointed the election of mayor, sheriffs, &c., to be in the common council, together with the masters and wardens of the companies. By 15 Edw. IV. masters and wardens were ordered to associate with themselves the honest men of their mysteries, and come in their best liveries to the elections; that is to say, the franchise was restricted to the "liverymen" of the companies. At this time the corporation exercised supreme control over the companies, and the companies were still genuine associations of the traders and householders of the city. The delegation of the franchise to the liverymen was thus, in point of fact, the selection of a superior class of householders to represent the rest. When the corporation lost its control over the companies, and the members of the companies ceased to be traders and householders, the liverymen were no longer a representative class, and some change in the system became necessary. The Reform Acts of 1532 and 1587 reformed the representation in several particulars. The liverymen of the companies, being freemen of the city, have still, however, the exclusive power of electing the lord mayor, sheriffs, chamberlain and other corporate officers.

The contributions made by the companies to the public purposes of the state and the city are interesting points in their early history. Their wealth and their representative character made them a most appropriate instrument for the enforcement of irregular taxation. The loan of £21,263, 6s. 8d. to Henry VIII. for his wars in Scotland, in 1544, is believed by Herbert to be the first instance of a pecuniary grant to the crown, but the practice rapidly gained ground. The confiscation of ecclesiastical property at the time of the Reformation affected many of the trusts of the companies; and they were compelled to make returns of their property devoted to religious uses, and to pay over the rents to the crown. In course of time the taxation of the companies became a regular source of supply to government. In the houses of the city hall for the most part were described these as unknovn and their demands, but looking at the representative and municipal character of the companies, and the purposes to which their contributions were applied, we may regard them as a rough but not unfair mode of taxation. The government, when money was wanted for public works, informed the lord mayor, who apportioned the sums required among the various societies, and issued precepts for its payment. Contributions towards setting the poor to work, erecting the Royal Exchange, cleansing the city ditch, discovering new countries, furnishing military and naval armaments, for men, arms and ammunition for the defence of the city, are among what Herbert calls the sponging expedients of the government. The crown occasionally interfered in a more unjustifiable manner with the companies in the exercise of their patronage. The Stuarts made strenuous efforts to get the control of the companies. Terrified by the proceedings in the que warranto case, most of the companies surrendered their charters to the crown, but such surrenders were annulled by the act of 2 William and Mary

\[1\) Properly the word should be spelled, as it was originally, "mystery;" it comes through the O. Fr. meister, modern métier, from Lat. magister, service, employment, and meant a trade or craft, and hence the plays acted by craftsmen and members of guilds were called "mystery plays" (see Drama). For the word meaning a hidden or secret rite, with which this has so often been confused, see Mystery.
LIVIA DRUSILLA—LIVINGSTON, E. 811

The Apothecaries, Armourers and Brasiers, Bakers, Barbers, Basket Makers, Blacksmiths, Bowyers, Brewers, Broderers, Butchers, Carmen, Carpenters, Clockmakers, Clothworkers, Coach and Coach-harness Makers, Cooks, Coopers, Cordwainers, Curriers, Cutlers, Distillers, Drapers, Dyers, Frenchmen, and Farriers.

The following are the twelve great companies in order of civic precedence: Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Taylors, Haberdashers, Salters, Ironmongers, Vintners, Cloth-workers. The "Irish Society" was incorporated in the 11 James I. as "the governor and assistants of the new plantation in Ulster, within the realm of Ireland." The twelve companies contributed in equal portions the sum of £60,000 for the new scheme, by which it was intended to settle a Protestant colony in the lands forfeited by the Irish rebels. The companies divided the settlement into twelve nearly equal parts, assigning one to each, but the separate estates are still held to be under the paramount jurisdiction of the Irish Society. The charter of the society was revoked by the court of star chamber in the reign of Charles I., but a new one was granted by Charles II., under which the society still acts.

Most of the companies administer charities of large value. Many of the more governors of charity schools, e.g. the Grocers have the Tenbridge Grammar School; the Mercers, St. Paul's School; the Merchant Taylors, the school bearing their name, &c. The constitution of the livery companies usually embraces (1) the court, which includes the masters at arms and is the executive and administrative body; (2) the livery or middle class, being the body from which the court is recruited; and (3) the general body of freemen, from which the livery is recruited. Several companies admit women as freemen. The fees are paid in something over twenty-one years of age born in lawful wedlock after the admission of his father to the freedom, by servitude (by being bound as an apprentice to a freeman of the company) or by redemption. Admissions to the livery of the Grocers is usually by payment of a considerable fee. For example, in the Merchant Taylors the fees are—upon taking up the freedom, by servitude or servitude, £1, 1s. 4d.; by redemption, £84; on admission to the livery, £50, 8s.; on election to the court of assistants, £15, 10s. In some time the possession of the livery may be the subject of much political discussion. Two parties threatened to attack them—on one side those who were anxious for extensive reforms in the municipal organization of London; on the other, those who wished to carry forward the process of incorporation; and the revocation of the rights which had already overtaken the universities, schools, and other charities. A Royal Commission was appointed in 1880 to inquire into all the livery companies, into the circumstances and dates of their foundation, objects for which they were founded and the objects were being carried into effect. A very valuable Report and Appendix (4 vols., 1884) was published, containing, inter alia, information on the constitution and powers of the governing bodies, the nature of admissions of members, the mode of appointment, duties and salaries and other emoluments of the servants of the companies, the property of, or held in trust for, the companies, its value, situation and description. The companies very frequently made returns to the Commission, the only ones not being so the Broderers, Bowyers, Distillers, Glovers, Tin-Plate Workers and Weavers. The Commission estimated the annual income of the companies to be from £75,000 to £100,000, about £200,000 of that amount being trust income, the balance corporate income.

Authorities.—In addition to the Report referred to above the following works may be consulted: H. T. Riley, Memorials of London and London Life (1868); Chronicle of London from 1085 to 1883 (ed. by Sir N. H. Nicolas and E. Tyrell, 1827); Munimenta Galbadiana (ed. by S. A. S. S. Kelman), in vols., 1859-1862; J. Toulmin Smith, English Gilds (published by Early English Text Society), with essay by L. Brentano (1870); W. Herbert, History of the Twelve Great Livery Companies (1837); C. Gough, The Royal Merchant (2 vols., 1859); Companies of the City of London (1862), contains a précis of the Royal Commission; P. H. LIVIA DRUSILLA (c. 55 B.C.—A.D. 20), Roman empress, was originally the wife of Tiberius Claudius Nero, by whom she had two sons, Drusus and Tiberius (afterwards emperor). But she became the wife of his great-grandson Augustus, who in 28 compelled her husband to divorce her and married herself, having first got rid of his own wife Scribonia. Her two sons, at their dying father’s request, were entrusted to the guardianship of Augustus, to whom she bore no children. Livia was suspected of committing various crimes to secure the throne for Tiberius, whereas Augustus naturally favoured the claims of his blood-relatives. The premature deaths of his nephew Marcellus (whom he had at first fixed upon as his successor) and of his grandsons Gaius and Lucius Caesar, the banishment of his grandson Agrippa Postumus, and even his own death, were attributed to her. But in any case Augustus’s affection for his wife appears to have suffered no diminution up to the last; by his will he declared her and Tiberius (whom he had adopted in A.D. 4) his heirs; Livia inherited a third of his property; she was adopted into the Julian gens, and henceforth assumed the name of Julia Augusta. The senate also elected her chief priestess of the college founded in honour of the deified Augustus. She lived to an extreme old age, and at first was chosen as joint-ruler with Tiberius. Tiberius, however, soon became tired of the maternal yoke; his retirement to Capreae is said to have been caused by his desire to escape from her. Livia continued to live quietly at Rome, in the full enjoyment of authority, until her death at an advanced age. Tiberius appears to have received the news with indifference, if not with satisfaction; he absented himself from the funeral, and refused to allow her apotheosis; her will was suppressed for a long time and only carried out, and the legacies paid, by Caligula.

LIVINGSTON, EDWARD (1764-1836), American jurist and statesman, was born in Clermont, Columbia county, New York, on the 26th of May 1764. He was a great-grandson of Robert Livingston, the first of the family to settle in America (see LIVINGSTON, WILLIAM). He graduated at Princeton in 1781, was admitted to the bar in 1785, and began to practice law in New York City, rapidly rising to distinction. In 1795-1801 he was a Republican representative in Congress, where he was one of the leaders of the opposition to Jay’s treaty, introduced the resolution calling upon President Washington for all papers relating to the treaty, and at the close of Washington’s administration voted with Andrew Jackson and other radicals against the address to the president. He opposed the Alien and Sedition Laws, introduced legislation on behalf of American seamen, and in 1800 attacked the president for permitting the extradition by the British government of Jonathan Robbins, who had committed murder on an English frigate, and had then escaped to South Carolina and falsely claimed to be an American citizen. In the debate on this question Livingston was opposed by John Marshall. In 1801 Livingston was appointed U.S. district-attorney for the state of New York, and while retaining that position was in the same year appointed mayor of New York City. When, in the summer of 1807, the city was visited by yellow fever, Livingston displayed courage and energy in his endeavours to prevent the spread of the disease and relieve distress.
the fever, during which the people gave many proofs of their attachment to him. On his recovery he found his private affairs in some confusion, and he was at the same time deeply indebted to the government for public funds which had been lost through the mismanagement or dishonesty of a confidential clerk, and for which he was responsible as district-attorney. He at once surrendered all his property, resigned his two offices in 1803, and removed early in 1804 to Louisiana. He soon acquired a large law practice in New Orleans, and in 1826 repaid the government in full, including the interest, which at that time amounted to more than the original principal.

Almost immediately upon his arrival in Louisiana, where the legal system had previously been based on Roman, French and Spanish law, and where trial by jury and other peculiarities of English common law were now first introduced, he was appointed by the legislature to prepare a provisional code of judicial procedure, which (in the form of an act passed in April 1805) was continued in force from 1805 to 1825. In 1807, after conducting a successful suit on behalf of a client's title to a part of the batture alluvial land near New Orleans, Livingston attempted to improve part of this land (which he had received as his ice) in the Batture, Ste Marie. Great popular excitement was aroused against him; his workmen were mobbed; and Governor Moreau de St Marie appealed to the Federal government to settle the question to the Federal government. Livingston's case was damaged by President Jefferson, who believed that Livingston had favoured Burr in the presidential election of 1800, and that he had afterwards been a party to Burr's schemes. Jefferson made it impossible for Livingston to secure his title, and in 1812 published a pamphlet "for the use of counsel" in the case against Livingston, to which Livingston published a crushing reply.

Livingston's final victory in the courts brought him little financial profit because of the heavy expenses of the litigation. During the war with England from 1812 to 1815 Livingston was active in rousing the mixed population of New Orleans to resistance. He used his influence to secure amnesty for Lafitte and his followers upon their offer to fight for the city, and in 1814-1815 acted as adviser and volunteer aide-de-camp to General Jackson, who was his personal friend. In 1821, by appointment of the legislature, of which he had become a member in the preceding year, Livingston began the preparation of a new code of criminal law and procedure, afterwards known in Europe and America as the "Livingston code", an attempt to prepare a new French and English, as was required by the necessities of practice in Louisiana and actually consisted of four codes—crimes and punishments, procedure, evidence in criminal cases, reform and prison discipline. Though substantially completed in 1824, when it was accidentally burned, and again in 1826, it was not printed entire until 1833. It never was adopted by the state. It was at once reprinted in England, France and Germany, attracting wide praise by its remarkable simplicity and vigour, and especially by reason of its philanthropic provisions in the code of reform and prison discipline, which noticeably influenced the penal legislation of various countries. In referring to this code, Sir Henry Maine spoke of Livingston as "the first legal genius of modern times" (Cambridge Essays, 1856, p.17). The spirit of Livingston's code was remedial rather than vindictive; it provided for the abolition of capital punishment and the making of penitentiary labour not a punishment forced on the prisoner, but a matter of his choice and a reward for good behaviour, bringing with it better accommodations. Its Code of Reform and Prison Discipline was adopted by Guatemala. Livingston was the leading member of the minceurs appointed to prepare a new civil code, which for the most part the legislature adopted in 1825, and the most important chapters of which, including all those on contract, were prepared by Livingston alone.

Livingston was again a representative in Congress during 1823-1825, a senator in 1829-1831, and for two years (1831-1833) secretary of state under President Jackson. In this last position he was one of the most trusted advisers of the president, for whom he prepared a number of state papers, the most important being the famous anti-nullification proclamation of the 19th of December 1832. From 1833 to 1835 Livingston was minister plenipotentiary to France, charged with procuring the fulfilment by the French government of the treaty negotiated by W. C. Rives in 1831, by which France had bound herself to pay an indemnity of twenty-five millions of francs for French spoliations of American shipping chiefly under the Berlin and Milan decrees, and the United States in turn agreed to pay to France 1,500,000 francs in satisfaction of French claims. Livingston's negotiations were conducted with excellent judgment, but the French Chamber of Deputies refused to make an appropriation to pay the first installment due under the treaty in 1833, relations between the two governments became strained, and Livingston was finally instructed to close the legation and return to America. He died on the 23rd of May 1836 at Montgomery Place, Dutchess county, New York, an estate left him by his sister, to which he had removed in 1831. Livingston was twice married. His first wife, Mary McEverson, whom he married on the 10th of April 1818, died on the 13th of March 1821. In June 1825 he married Madame Marie de la Colline, daughter of Moreau de St Domingo, whose maiden name was Davezac de Castera, and who was a refugee in New Orleans from the revolution in Santo Domingo. She was a woman of extraordinary beauty and intellect, and is said to have greatly influenced her husband's public career.

See C. H. Hunt, Life of Edward Livingston (New York, 1864); Livingston's Works (2 vols., New York, 1873); and Louise Livingston Hunt, Memoir of Mrs Edward Livingston (New York, 1886).

LIVINGSTON, ROBERT R. (1746-1813), American statesman, son of Robert R. Livingston (1718-1775), a justice of the New York supreme court after 1763) and brother of Edward Livingston (see above), was born in New York City, on the 27th of November 1746. He graduated at King's College, New York (now Columbia University), in 1765, was admitted to the bar in 1773, and for a short time was a law partner of John Jay. In 1773 he became recorder of New York City, but soon identified himself with the Whig or Patriot element there, and was forced to give up this position in 1775. He was a member of the second, third and fourth Provincial Congresses of New York (1775-1777), was a delegate from New York to the Continental Congress 1775-1777 and again in 1786-1787, and was a member of the convention which drafted the Declaration of Independence. He was prevented from signing that document by his absence at the time to attend a meeting of the fourth New York Provincial Congress, which on the 10th of July became the Convention of the Representatives of the state of New York, and by which at Kingston in 1777 the first state constitution was adopted, Livingston having been a member of the committee that drafted this instrument. He was the first chancellor of the state, from 1777 to February 1801, and is best known as "Chancellor" Livingston. In this capacity he administered the oath of office to Washington at his first inauguration to the presidency, in New York, on the 30th of April 1789. Previously, from October 1781 to June 1783, he had been the first secretary of foreign affairs under the Confederation, and his European correspondence, especially with Franklin, was of the utmost value in accomplishing peace with Great Britain. In 1788 he had been a member of the New York Convention, which ratified for that state the Federal Constitution. He became an anti-Federalist and in 1798 unsuccessfully opposed John Jay in the New York gubernatorial campaign. In 1801, having refused an appointment as secretary of the navy, he became minister to France on President Jefferson's appointment. He had refused this post when Washington offered it to him in 1794. He arrived in France in November 1801, and in 1803, in association with James Monroe, effected on behalf of his government the purchase from France of what was then known as "Louisiana," the credit for this purchase being largely his (see LOUISIANA PURCHASE). In 1804 Livingston withdrew from public life, and after a year
of travel in Europe returned to New York, where he promoted various improvements in agriculture. He did much to introduce the use of gypsum as a fertilizer, and published an Essay on Sheep (1800). He was long interested in the problem of steam navigation; before he went to France he received from the state of New York a monopoly of steam navigation on the waters of the state and assisted in the experiments of his brother-in-law, John Stevens; in Paris he met Robert Fulton, and with him in 1802 made successful trials on the Seine of a paddle wheel steamboat; in 1803 Livingston (jointly with Robert Fulton) received a renewal of his monopoly in New York, and the first successful steam-vehicle, which operated on the Hudson in 1807, was named after Livingston's home, Clermont (N.Y.). He died at Clermont on the 26th of February 1813.

Livingston and George Clinton were chosen to represent New York state in Statuary Hall, in the capitol, at Washington, D.C., the statue of Livingston is by E. D. Palmer.

LIVINGSTON, WILLIAM (1723-1790), American political leader, was born at Albany, New York, probably on the 30th of November 1723. He was the son of Philip Livingston (1680-1749), and grandson of Robert Livingston (1654-1725), who was born at Ancrum, Scotland, emigrated to America about 1673, and received grants (beginning in 1680) to "Livingston Manor" (a tract of land on the Hudson, comprising the greater part of what are now Dutchess and Columbia counties). This Robert Livingston, founder of the American family, became in 1675 secretary of the important Board of Indian Commissioners; he was a member of the New York Assembly in 1711-1715 and 1716-1727 and its speaker in 1718-1725, and in 1701 made the proposal that all the English colonies in America should be grouped for administrative purposes "into three distinct governments."

William Livingston graduated at Yale College in 1741, studied law in the city of New York, and was admitted to the bar in 1748. He served in the New York legislature (1759-1760), but his political influence was long exerted chiefly through pamphlets and newspaper articles. The Livingston family then led the Dissenters, who later became Whigs, and the De Lancey family represented the Anglican Tory interests. Through the columns of the Independent Reflector, which he established in 1753, Livingston fought the attempt of the Anglican party to bring the projected King's College (now Columbia University) under the Church of England. After the suspension of the Reflector in 1753, he edited in the New York Mercury the "Watch Tower" section (1754-1755), which became the recognized organ of the Presbyterian faction. In opposition to the efforts of the Anglicans to procure the establishment of an American episcopate, he wrote an open Letter to the Right Reverend Father in God, John Lord, Bishop of Llandaff (1758), and edited and in large measure wrote the "American Whig" columns in the New York Gazette (1768-1769). In 1772 he removed to Elizabeth, New Jersey, where after 1773 he lived on his estate known as "Liberty Hall." He represented New Jersey in the first and second Continental Congresses (1774, 1775-1776), but left Philadelphia in June 1776, probably to avoid voting on the question of adopting the Declaration of Independence, which he regarded as inexpedient. He was chosen the first Superior of the state of New Jersey in 1776, and was regularly re-elected until his death in 1790. Loyal to American interests and devoted to General Washington, he was one of the most useful of the state executives during the War of Independence. While governor he was a frequent contributor to the New Jersey Gazette, and in this way he greatly aided the American cause during the war by his denunciation of the enemy and appeals to the patriotism of his countrymen. He was a delegate to the Federal Constitutional Convention of 1787, and supported the New Jersey small-state plan. In 1794 he joined with his brother, Philip Livingston, his brother-in-law, William Alexander ("Lord Stirling") and others in founding what is now known as the Society Library of New York. With the help of William Smith (1758-1793), the New York historian, William Livingston prepared a digest of the laws of New York for the period 1601-1756, which was published in two volumes (1752 and 1762). He died at Elizabeth, New Jersey, on the 25th of July 1790.

His brother, PETER VAN BRUGH LIVINGSTON (1710-1792), was a prominent merchant and a Whig political leader in New York. He was one of the founders of the College of New Jersey (now Princeton University), was a member of the New York Council for some years before the War of Independence, a member and president of the First Provincial Congress of New York (1775), and a member of the Second Provincial Congress (1775-1776).

Another brother, PHILIP LIVINGSTON (1716-1778), was also prominent as a leader of the New York Whigs or Patriots. He was a member of the New York Assembly in 1759-1769, a delegate to the Stamp Act Congress of 1765, a member of the Continental Congress from 1774 until his death and as such a signer of the Declaration of Independence, and in 1777-1778 was a member of the first state senate.

William's son, (Henry) Brockholst Livingston (1757-1823), was an officer in the American War of Independence, and was an able lawyer and judge. From 1807 until his death he was an associate justice of the United States Supreme Court, and he wrote political pamphlets under the pen-name "Decius."
and was the means of identifying his body after his death. To
a house, mainly built by himself at Mabota, Livingstone in
1844 brought home his wife, Mary Moffat, the daughter of
Moffat of Kuruman. Here he laboured till 1846, when he
removed to Chonuane, 40 m. farther north, the chief place of
the Bakwain or Bakwena tribe under Sekelie. In 1847 he again
removed to Kolobeng, about 40 m. westwards, the whole tribe
following their missionary. With the aid and in the company
of two English sportsmen, William C. Oswell and Munro Murray,
he was able to undertake a journey to Lake Ngami, which had
never yet been seen by a white man. Crossing the Kalahari
Desert, of which Livingstone gave the first detailed account,
they reached the lake on the 1st of August 1849. In April next
year he made an attempt to reach Sebituane, who lived 200 m.
beyond the lake, this time in company with his wife and children,
but again got no farther than the lake, as the children were
seized with fever. A year later, April 1851, Livingstone, again
accompanied by his family and Oswell, set out, this time with
the intention of settling among the Makololo for a period. At
last he succeeded, and reached the Chobe (Kwando), a southern
tributary of the Zambezi, and in the end of June reached the
Zambezi itself at the town of Sesheke. Leaving the Chobe
on the 13th of August the party reached Cape Town in April
1852. Livingstone may now be said to have completed the
first period of his career in Africa, the period in which the
work of the missionary had the greatest prominence. Hence-
forth he appears more in the character of an explorer, but it
must be remembered that he regarded himself to the last
as a pioneer missionary, whose work was to open up the
country to others.

Having seen his family off to England, Livingstone left Cape
Town on the 8th of June 1852, and turning north again reached
Linyanti, the capital of the Makololo, on the Chobe, on the
23rd of May 1853, being cordially received by Sekelotu and
his people. His first object was to seek for some healthy high
lands where he might plant a station. Ascending the Zambezi, he
however, found no place free from the tsetse fly, and therefore
resolved to discover a route to the interior from either the west
or east coast. To accompany Livingstone twenty-seven men
were selected from the various tribes under Sekelotu, partly
with a view to open up a trade route between their own country
and the coast. The start was made from Linyante on the 11th
of November 1853, and, by ascending the Luba, Lake Dilolo
was reached on the 20th of February 1854. On the 4th of April
the Kwango was crossed, and on the 31st of May the town of
Loanda was entered, Livingstone, however, being all but dead
from fever, semi-starvation and dysentery. From Loanda
Livingstone sent his astronomical observations to Sir Thomas
Maclear at the Cape, and an account of his journey to the Royal
Geographical Society, which in May 1855 awarded him its
patron’s medal. Loanda was left on the 20th of September
1854, but Livingstone lingered long about the Portuguese set-
tlements before resuming the march. After the mouth of the
party reached Lake Dilolo on the 13th of June 1855. Here
Livingstone made a careful study of the hydrography of the
country. He “now for the first time apprehended the true
form of the river systems and the continent,” and the con-
clusions he came to have been essentially confirmed by sub-
sequent observations. The return journey from Lake Dilolo
was by the same route as that by which the party came, Linyante
being reached in the beginning of September.

For Livingstone’s purposes the route to the west was un-
available, and he decided to follow the Zambezi to its mouth.
With a numerous following, he left Linyante on the 8th of
November 1855. A fortnight afterwards he discovered the
famous “Victoria” falls of the Zambezi. He had already
formed a true idea of the configuration of the continent as a
great hollow or basin-shaped plateau, surrounded by a ring
of mountains. Livingstone reached the Portuguese settlement
of Tete on the 2nd of March 1856, in a very emaciated condition.
Here he left his men and proceeded to Quilimane, where he
arrived on the 20th of May, thus having completed in two years
and six months one of the most remarkable and fruitful journeys
on record. The results in geography and in natural science in
each of its departments were abundant and accurate; his observa-
tions necessitated a reconstruction of the map of Central Africa.
When Livingstone began his work in Africa the map was virtu-
ally a blank from Kuruman to Timbuktu, and nothing but envy
or ignorance can throw any doubt on the originality of his
discoveries.

On the 12th of December he arrived in England, after an
absence of sixteen years, and met everywhere the welcome of
a hero. He told his story in his Missionary Travels and Researches
in South Africa (1857) with straightforward simplicity, and with
no effort after literary style, and no apparent consciousness
that he had done anything extraordinary. Its publication brought
what he would have considered a competency had he felt himself
at liberty to settle down for life. In 1857 he severed his con-
nection with the London Missionary Society, with whom, however,
he always remained on the best of terms, and in February 1858
he accepted the appointment of Her Majesty’s consul at Quilimane
for the eastern coast and the independent districts in the interior,
and commander of an expedition for exploring eastern and
central Africa.” The Zambezi expedition, of which
Livingstone thus became commander, sailed from Liverpool
in H.M.S. “Pearl” on the 10th of March 1858, and reached the
mouth of the Zambezi on the 14th of May. The party, which
included Dr. (afterwards Sir) John Kirk and Livingstone’s
brother Charles, ascended the river from the Kongone mouth
in a steam launch, the “Ma-Robot”; reaching Tete on the
8th of September. The remainder of the year was devoted to
an examination of the river above Tete, and especially the
Kebrabasa rapids. Most of the year 1859 was spent in the
exploration of the river Shiré and Lake Nyasa, which was
discovered in September; and during a great part of the year
1860 Livingstone was engaged in fulfilling his promise to take
such of the Makololo home as cared to go. In January of next
year arrived Bishop C. F. Mackenzie and a party of missionaries
sent out by the Universities Mission to establish a station on the
upper Shiré.

After exploring the river Rovuma for 30 m. in his new vessel
the “Pioneer,” Livingstone and the missionaries proceeded
up the Shiré to Chiliba’s; there they found the slave trade
crampent. On the 15th of July Livingstone, accompanied by
several native carriers, started to show the bishop the country.
Several bands of slaves whom they met were liberated, and after
seeing the missionary party settled in the highlands to the south
of Lake Chiliba (Shirwa) Livingstone spent from August to
November in exploring Lake Nyasa. While the boat sailed up
the west side of the lake to near the north end, the explorer
marched along the shore. He returned more resolved than ever
to do his utmost to rouse the civilized world to put down the
desolating slave-trade. On the 30th of January 1862, at the
Zambezi mouth, Livingstone welcomed his wife and the ladies
who had been with him were the sections of the “Lady
Nyassa,” a river steamier which Livingstone had built at
his own expense. When the mission ladies reached the mouth
of the Ruo tributary of the Shiré, they were stunned to hear
the death of the bishop and one of his companions. This
was a sad blow to Livingstone, seeming to have rendered
all his efforts to establish a mission futile. A still greater
loss to him was that of his wife at Chupanga, on the 27th of
April 1862.

The “Lady Nyassa” was taken to the Rovuma. Up this river
Livingstone managed to steam 156 m., but farther progress
was arrested by rocks. Returning to the Zambezi in the begin-
ing of 1863, he found that the desolating caused by the slave
trade was more horrible and widespread than ever. It was clear
that the Portuguese officials were themselves at the bottom
of the traffic. Kirk and Charles Livingstone being compelled to
return to England on account of their health, the doctor resolved
once more to visit the lake, and proceeded some distance up
the west side and then north-west as far as the watershed
that separates the Loangwa from the rivers that run into the lake.
Meanwhile a letter was received from Earl Russell recalling the expedition by the end of the year. In the end of April 1864 Livingstone reached Zanzibar in the “Lady Nyassa,” and on the 23rd of July Livingstone arrived in England. He was naturally disappointed with the comparative failure of this expedition. Still the geographical results, though not in extent to be compared to those of his first and his final expeditions, were of high importance, as were those in various departments of science, and he had unknowingly laid the foundations of the British protectorate of Nyasaland. Details will be found in his *Narrative of an Expedition to the Zambesi and its Tributaries*, published in 1865.

By Sir Roderick Murchison and his other staunch friends Livingstone was as warmly welcomed as ever. When Murchison proposed to him that he should go out again, although he seems to have had a desire to spend the remainder of his days at home, the prospect was too tempting to be rejected. He was appointed British consul to Central Africa without a salary, and government contributed only £500 to the expedition. The chief help came from private friends. During the latter part of the expedition government granted him £1,000, but that, when he learned of it, was devoted to his great undertaking. The Geographical Society contributed £500. The two main objects of the expedition were the suppression of slavery by means of civilizing influences, and the ascertainment of the watershed in the region between Nyasa and Tanganyika. At first Livingstone thought the Nile problem had been all but solved by Speke, Baker and Burton, but the idea grew upon him that the Nile sources must be sought farther south, and his last journey became in the end a forlorn hope in search of the “fountains” of Herodotus.

Leaving England in the middle of August 1865, Livingstone arrived at Zanzibar on the 28th of January 1866. He was landed at the mouth of the Rovuma on the 22nd of March, and started for the interior on the 4th of April. His company consisted of thirteen sepoyos, ten Johanna men, nine African boys from Nasik school, Bombay, and four boys from the Shiré region, besides camels, buffaloes, mules and donkeys. This imposing outfit soon melted away to four or five boys. Rounding the south end of Lake Nyasa, Livingstone struck in a north-north-west direction for the south end of Lake Tanganyika, over country much of which had not previously been explored. The Loangwa was crossed on the 10th of December 1866. On Christmas day Livingstone lost his four goats, a loss which he felt very keenly, and the medicine chest was stolen in January 1867. Fever came upon him, and for a time was his almost constant companion. He crossed this, with other serious ailments which subsequently attacked him, and which he had no medicine to counteract, told on even his iron frame. The Chambesi was crossed on the 28th of January, and the south end of Tanganyika reached on the 21st of March. Here, much to his vexation, he got into the company of Arab slave dealers (among them being Tippoo-Tib) by whom his movements were hampered; but he succeeded in reaching Lake Mweru (Nov. 1867). After visiting Lake Mofwa and the Lualaba, which he believed was the upper part of the Nile, he, on the 8th of July 1868, discovered Lake Bangweulu. Proceeding up the west coast of Tanganyika, he reached Ujiji on the 14th of March 1869, “a ruckle of bones.”

Livingstone recrossed Tanganyika in July, and passed through the country of the Manyema, but baffled partly by the natives, partly by the slave hunters, and partly by his long illnesses it was not till the 10th of March 1872 that he succeeded in reaching the Lualaba, at the town of Nyangwe, where he stayed four months, vainly trying to get a canoe to take him across. It was here that a party of Arab slaves, without warning or provocation, assembled one day when the market was busiest and commenced shooting the women, hundreds being killed or drowned in trying to escape. Livingstone had “the impression that he was in hell,” but was helpless, though his “first impulse was to pistol the murderers.” The account of this scene which he sent home roused indignation in England to such a degree as to lead to determined and to a considerable extent successful efforts to get the sultan of Zanzibar to suppress the trade. In sickened disgust the weary traveller made his way back to Ujiji, which he reached on the 16th of October. Five days after his arrival in Ujiji he was inspired with new life by the timely arrival of H. M. Stanley, the richly laden almoner of Mr. Gordon Bennett, of the *New York Herald*. With Stanley Livingstone explored the north end of Tanganyika, and proved conclusively that the Rusizi runs into and not out of it. In the end of the year the two started eastward for Unyamwezi, where Stanley provided Livingstone with an ample supply of goods, and bade him farewell. Stanley left on the 15th of March 1872, and after Livingstone had waited weekly in Unyamwezi for five months, a troop of thirty-seven men and boys arrived, good and faithful fellows on the whole, selected by Stanley himself. Thus attended, he started on the 17th of August for Lake Bangweulu, proceeding along the east side of Tanganyika. His old enemy dysentery soon found him out. In January 1873 the party got among the endless spongy jungle on the east of Lake Bangweulu, Livingstone’s object being to go round by the south and away west to find the “fountains.” The doctor got worse and worse, and in the middle of April he had unwillingly to submit to be carried in a rude litter. On the 20th of April Chitambo’s village on the Lulimala, in Ilala, on the south shore of the lake, was reached. The last entry in the journal is on the 27th of April: “Kneaded up quite, and remain—recover—to buy milch goats. We are on the banks of the Mollamo.” On the 30th of April he with difficulty wound up his watch, and early on the morning of the 1st of May the boys found “the great master,” as they called him, kneeling by the side of his bed, dead. His faithful men preserved the body in the sun as well as they could, and, wrapping it carefully up, carried it and all his papers, instruments and other effects from Africa to Zanzibar. It was borne to England with all honour, and on the 18th of April 1874, was deposited in Westminster Abbey. His faithfully kept journals during these seven years’ wanderings were published under the title of the *Last Journals of David Livingstone in Central Africa*, in 1874, edited by his old friend the Rev. Horace Walker. In Old Chimambo’s time and place of his death are commemorated by a permanent monument, which replaced in 1902 the tree on which his native followers had recorded the event.

In spite of his sufferings and the many compulsory delays, Livingstone’s discoveries during these last years were both extensive and of prime importance as leading to a solution of African hydrography. No single African explorer has ever done so much for African geography as Livingstone during his thirty years’ work. His travels covered one-third of the continent, from the Cape to near the equator, and from the Atlantic to the Indian Ocean. Livingstone was no hurried traveller; he did his journeying leisurely, carefully observing and recording all that was worthy of note, with rare geographical instinct and the eye of a trained scientific observer, studying the ways of the people, eating their food, living in their huts, and sympathizing with their joys and sorrows. In all the countries through which he travelled his memory is cherished by the native tribes who, almost without exception, treated Livingstone as a superior being; his treatment of them was always tender, gentle and gentlemanly. By the Arab slavers whom he opposed he was also greatly admired, and was by them styled “the very great doctor.” “In the annals of exploration of the Dark Continent,” wrote Stanley many years after the death of the missionary explorer, “we look in vain among other nationalities for a name such as Livingstone’s. He stands pre-eminent above all; he unites in himself all the best qualities of other explorers. . . . Britain . . . excelled herself even when she produced the strong and perseverant Scotchman, Livingstone.” But the direct gains to geography and science are perhaps not the greatest results of Livingstone’s journeys. His example and his death acted like an inspiration, filling Africa with an army of explorers and missionaries, and raising in Europe so powerful a feeling against the slave trade that through him it may be considered as having received its death-blow. Personally Livingstone was a pure and tender-hearted man, full of humanity and sympathy, simple-minded as a child.
The motto of his life was the advice he gave to some school children in Scotland—"Fear God, and work hard."

See, besides his own narratives and W. G. Blackie’s Life (1880), the publications of the London Missionary Society from 1840, the Journal and Proceedings of the Royal Geographical Society, the dispatches to the Foreign Office sent home by Livingstone during his last two expeditions, and Stanley’s Autobiography (1909) and How I Found Livingstone (1872).

LIVINGSTONE MOUNTAINS, a band of highlands in German East Africa, forming the eastern border of the rift-valley of Lake Nyasa, at the northern end of the lake. In parts these highlands, known also under their native name of Kinga, present rather the character of a plateau than of a true mountain range, but the latter name may be justified by the fact that they form a comparatively narrow belt of country, which falls considerably to the east as well as to the west. The northern end is well marked in 8° 50’ S. by an escarpment falling to the Ruaha valley, which is regard as a northern-east branch of the main rift-valley. Southwards the Livingstone range terminates in the deep valley of the Ruhuhu in 10° 30’ S., the first decided break in the highlands that is reached from the north, on the east coast of Nyasa. Geologically the range is formed on the side of the lake by a zone of gniss running in a series of ridges and valleys generally parallel to its axis. The ridge nearest the lake (which in Mount Jamimb or Chamembe, 6° 41’ S., rises to an absolute height of 5750 ft., or 6200 ft. above Nyasa) falls almost sheer to the water, the same steep slope being continued beneath the surface. Towards the south the range appears to have a width of some 20 m. only, but northwards it widens out to about 40 m., though broken here by the depression, drained towards the Ruaha, of Buanyi, on the south side of which is the highest known summit of the range (9600 ft.). North and east of Buanyi, as in the eastern half of the range generally, table-topped mountains occur, composed above of horizontally bedded quartzites, sandstones and conglomerates. The uplands are generally clothed in rich grass, forest occurring principally in the hollows, while the slopes towards the lake are covered with poor scrub. Native settlements are scattered over the whole range, and German mission stations have been established at Bulongwa and Mtandala, a little north of the north end of Nyasa. The climate is here healthy, and night frosts occur in the cold season. European crops are raised with success. At the foot of the mountains on Lake Nyasa are the ports of Wied- hafen, at the mouth of the Ruhuhu, and Old Langenburg, at the east-north-east of the lake. (E. H.)

LIVIUS ANDRONICUS (c. 284-240 B.C.), the founder of Roman epic poetry and drama. His name, in which the Greek Ανδρόνικος is combined with the gentle name of one of the great Roman heroes, is not indicative of his own position as a manumitted slave, is also significant of the influences by which Roman literature was fostered, viz. the culture of men who were either Greeks or "semi-Graeci" by birth and education, and the protection and favour bestowed upon them by the more enlightened members of the Roman aristocracy. He is supposed to have been a native of Tarentum, and to have been brought, while still a boy, after the capture of that town in 272, as a slave to Rome. He lived in the household of a member of the gens Livia, probably M. Livius Salinator. He determined the course which Roman literature followed for more than a century after his time. The imitation of Greek comedy, tragedy and epic poetry, which produced great results in the hands of Naevius, Plautus, Ennius and their successors, received its first impulse from him. To judge, however, from the insignificant remains of his work, and from the opinions of Cicero and Horace, he even had no pretension either to originality or to artistic accomplishment. His real claim to distinction was that he was the first great schoolmaster of the Roman people.

We learn from Suetonius that, like Ennius after him, he obtained his living by teaching Greek and Latin; and it was probably as a school-book, rather than as a work of literary pretension, that his translation of the Odyssey into Latin Saturnian verse was executed. This work was still used in schools in the time of Horace (Ep. ii. 1. 69), and, although faultily executed, satisfied a real want by introducing the Romans to a knowledge of Greek. Such knowledge became essential to men in a high position as a means of intercourse with Greeks, while Greek literature stimulated the minds of leading Romans. Moreover, southern Italy and Sicily afforded many opportunities for witnessing representations of Greek comedies and tragedies. The Romans and Italians had an indigenous drama of their own, known by the name of Satura, which prepared them for the reception of the more regular Greek drama. The distinction between this Satura and the plays of Euripides or Menander was that it had no regular plot. This the Latin drama first received from Livius Andronicus; but it did so at the cost of its originality. In 240, the year after the end of the first Punic War, he produced at the ludi Romani a translation of a Greek play (it is uncertain whether a comedy or tragedy or both), and this representation marks the beginning of Roman literature (Liv. vii. 2). Livius himself took part in his plays, and in order to spare his voice he introduced the custom of having the solos (cautica) sung by a boy, while he himself represented the action of the song by dumb show. In his translation he discarded the native Saturnian metre, and adopted the iambic, trochaic and cretic metres, to which Latin more easily adapted itself than either to the hexameter or to the lyrical measures of a later time. He continued to produce plays for more than thirty years after this time. The titles of his tragedies—Achilles, Aegisthus, Equus Trojanus, Horsine, Tereus—are all suggestive of subjects which were treated by the later tragic poets of Rome. In the year 207, when he must have been of a great age, he was appointed to compose a hymn of thanksgiving, sung by maidens, for the victory of the Metaurus and an intercessory hymn to the Aventine Juno. As a further tribute of national recognition the "college" or "gild" of poets and actors was granted a place of meeting in the temple of Minerva on the Aventine.

See fragments in L. Müller, Livi Andronici et Ca. Naerii Fabularum Reliquiae (1885); also J. Wordsworth, Fragments and Specimens of Early Latin (1874); Mommsen, Hist. of Rome, bk. iii. ch. 14.

LIVNO, a town of Bosnia, situated on the eastern side of the fertile plain of Livno, at the foot of Mount Krug (6581 ft.). Pop. about 5000. The Dalmatian border is 7 m. W. Livno had a trade in grain, live-stock and silver filigree-work up to 1904, when a fire swept away more than 500 of the old Turkish houses, together with the Roman citadel. Remains prove that Livno occupies the site of a Roman settlement, the name of which is uncertain. The Roman Catholic convent of Guriei is 6 m. S.

LIVONIA, or Livland (Russian, Lithondia), one of the three Baltic provinces of Russia, bounded W. by the Gulf of Riga, N. by Estonia, E. by the governments of Siberia, Omsk, Pavlovsk and Vitebsk, and S. by Courland. A group of islands (117 sq. m.) at the entrance of the Gulf of Riga, of which Oesel, Mohn, Runo and Paternoster are the largest, belong to this government. It covers an area of 18,160 sq. m., but of this the part of Lake Peipus which belongs to it occupies 1000. Its surface is diversified by several plateaus, those of Haanhof and of the Livonian Aa having an average elevation of 400 to 700 ft., while several summits reach 800 to 1000 ft. or more. The edges of the plateaux are gapped by deep valleys; the hilly tract between the Dvina and its tributary the Livonian Aa has received, from its picturesque narrow valleys, thick forests and numerous lakes, the name of "Livonian Switzerland."

The plateau of Odenpää, drained by tributaries of the Embach river, which flows for 93 m. from Lake Virž-yrivi into Lake Peipus, occupies an area of 1850 sq. m., and has an average elevation of 300 ft. Small rivers are scattered over Livonia, of which that of Virž-yrivi, having a surface of 106 sq. m. (115 ft. above sea-level), is the largest. Marshes and peat-bogs occupy one-tenth of the province. Of the numerous rivers, the Dvina, which flows for 90 m. along its frontier, the Pernar, Salus, Livonian Aa and Embach are navigable.

The Silurian formation which covers Esthonia, appears in the northern part of Livonia, the remainder of the province consisting of Devonian strata. The whole is overlaid with
The Glacial deposits, sometimes 400 ft. thick. The typical bottom moraine, with erratics from Finland, extends all over the country. Glacial furrows, striae and elongated troughs are met with everywhere, running mostly from north-west to south-east, as well as àскаr or eskâres, which have the same direction. Sand-duunes cover large tracts on the shores of the Baltic. No traces of marine deposits are found higher than 100 or 150 ft. above the present sea-level. The soil is not very fertile. Forests cover about two-fifths of the surface. The climate is rather severe. The mean temperatures are 43° F. at Riga (winter 23°, summer 63°) and 40° at Yuriev. The winds are very variable; the average number of rainy and snowy days is 146 at Riga (rainfall 11 in.); they are not uncommon.

The population of Latvia, which was 612,600 in 1816, reached 1,000,876 in 1870, and 1,295,231 in 1897, of whom 43.4% were Letts, 39.9% Este, 7.6% Germans, 5.4% Russians, 2% Jews and 1.2% Poles. The estimated population of Latvia, old and new, in the year 1905 was 1,411,000. The Livs, who formerly extended east into the government of Vitebsk, have nearly all passed away. Their native language, of Finnish origin, is rapidly disappearing, their present language being a Lettish patois. In 1846 a grammar and dictionary of it were made with difficulty from the mouths of old people. The Estehs, who resemble the Finns of Tavastland, have maintained their ethnic features, their customs, national traditions, songs and poetry, and their harmonious language. There is a marked revival of national feeling, favoured by the Young Estonia. The prevailing religion is the Lutheran (79.8%); 4.3% belong to the Orthodox Greek Church; of the Russians however, a considerable proportion are Raskolniks (Non-conformists) of the Russian Catholics amount to 2.3% and the Jews to 2%. The Russian civil code was introduced in the Baltic provinces in 1835, and the use of Russian, instead of German, in official correspondence and in law courts, was ordered in 1867, but not generally brought into practice.

Nearly all the soil belongs to the nobility, the extent of the peasants' estates being only 15% of the entire area of the government. In 1846 it was abolished in 1850, but the peasants remained under the jurisdiction of their landlords. The class of peasants, proprietors being restricted to a small number of wealthy peasants, the bulk have remained tenants at will; they are very miserable, and about one-fourth of them are continually wandering in search of work. From time to time the emigration takes the shape of a mass movement, which the government stops by forceable measures. The average size of the landed estates is 50,000 to 11,000 acres, far above the average of other parts of Russia. Agriculture has reached a high degree of perfection on the estates of the Baltic Russians. Crops are rye, oats, barley, flax and potatoes, with some wheat, hemp and buckwheat. Dairy-farming and gardening are on the increase. Fish and flax are extensively engaged. The peasantry's occupation to nearly 100,000 persons, and is also carried on in the government of Livonia and in the interior. The flax is sold, cloth, cotton, and flax fibre, steam flour and saw mills, distilleries and breweries, machinery works, paper mills, furniture, tobacco, soap, candles, and hardware works are among the chief industrial establishments. Livonia carries on a large export trade, especially through Riga and Pernau, in petroleum, wool, oilcake, flax, linseed, hemp, grain, timber and wooden wares; the Dvina is the chief channel for this trade.

Education stands on a much higher level than elsewhere in Russia, no less than 87% of the children receiving regular instruction. The higher educational institutions include Yuriev (Dorpat) University, Riga University, Parnawa Grammar School, which is a high school for the clergy.

The government is divided into nine provinces, the chief towns of which, with their populations in 1897, are: Riga, capital of the government (282,943); Amsburg, in the island of Oesel (461); Yuriev (Dorpat) (42,421); Fellin (769); Parnawa (12,856); Walk (10,139); Wenden (11,276), Wenden (11,276) and Wolmar (5124). The capital of the government is Riga.

The mouth of the Dvina. In 1186 the emissaries of the archbishop of Bremen began to preach Christianity among the Estehs and Letts, and in 1201 the bishop of Livonia established his residence at Riga. In 1202 or 1204 Innošt of Tils recognized the order of Brothers of the Sword, the residence of its grand master being at Wenden; and the order, spreading the Christian religion by the sword among the natives, carried on from that time a series of uninterrupted wars against the Russian republics and Lithuania, as well as a struggle against the archbishop of Riga, Riga having become a centre for trade, intermediate between the Hanseatic towns and those of Novgorod, Pskov and Polotsk. The first active interference of Lithuania in the affairs of Livonia took place immediately after the great outbreak of the peasants on Oesel; Oligerid then devastated all southern Livonia. The order, having purchased the Danish part of Estonia, in 1347, began a war against the bishop of Riga, as well as against Lithuania, Poland and Russia. The wars against those powers were terminated respectively in 1455, 1466 and 1463. About the end of the 15th century the master of the order, Plettenberg, acquired a position of great importance, and in 1527 he was recognized as a prince of the empire by Charles V. On the other hand, the authority of the bishops of Riga was soon completely destroyed (1566). The war of the order with Ivan IV of Russia in 1558 led to a division of Livonia, its northern part, Dorpat included, being taken by Russia, and the southern part falling under the dominion of Poland. From that time (1561) Livonia formed a subject of dispute between Poland and Russia, the latter only formally abdicating its rights to the country in 1582. In 1621 it was the theatre of a war between Poland and Sweden, and was conquered by the latter power, enjoying thus for twenty-five years a milder rule. In 1654, and again at the beginning of the 18th century, it became the theatre of war between Poland, Russia and Sweden, and was finally conquered by Russia. The official concession was confirmed by the treaty of Nystad in 1721.

P. A. K.; J. T. BE.

Livy [Titus Livius] (59 B.C.-A.D. 17), Roman historian, was born at Patavium (Padua). The ancient connexion between his native city and Rome helped to turn his attention to the study which became the work of his life. For Padua claimed, like Rome, a Trojan origin, and Livy is careful to place its founder Antenor side by side with Aeneas. A more real bond of union was found in the dangers to which both had been exposed from the assaults of the Celts (Livy x. 2), and Padua must have been drawn to Rome as the conqueror of her hereditary foes. Moreover, at the time of Livy's birth, Padua had long been in possession of the full Roman franchise, and the historian's family name may have been taken by one of his ancestors out of compliment to the great Livian gens at Rome, whose connexion with Cassius Cassius Gaul is well-established (Suet. Tiber. 3), and by one of whom his family may have been enfranchised.

Livy's easy independent life at Rome, and his ascendency leavings in politics seem to show that he was the son of well-born and opulent parents; he was certainly well educated, being widely read in Greek literature, and a student both of rhetoric and philosophy. We have also evidence in his writings that he had prepared himself for his great work by researches into the history of his native town. His youth and early manhood, spent perhaps chiefly at Padua, were cast in stormy times, and the impression which they left upon his mind was ineradicable.

In the Civil War his personal sympathies were with Pompey and the republican party (Tac. Ann. iv. 34); but far more lasting in its effect was his experience of the licence, anarchy and confusion of those dark days. The rule of Augustus he seems to have accepted as a necessity, but he could not, like Horace and Virgil, welcome it as inaugurating a new and glorious era. He writes of it with despondency as a degenerate and declining age; and, instead of triumphant prophecies of world-wide rule, such as we find in Horace, Livy contents himself with pointing out the dangers which already threatened Rome, and exhorting his
It was probably about the time of the battle of Actium that Livy established himself in Rome, and there he seems chiefly to have resided until his retirement to Padua shortly before his death. We have no evidence that he travelled much, though he must have paid at least one visit to Campania (xxxviii. 56), and he never, so far as we know, took any part in political life. Nor, though he enjoyed the personal friendship and patronage of Augustus (Tac. Ann. iv. 34) and stimulated the historical zeal of the future emperor Claudius (Suet. Claud. xii.), can we detect in him anything of the courtier. There is not in his history a trace of that rather gross adulation in which even Virgil does not disdain to indulge. His republican sympathies were freely expressed, and as freely pardoned by Augustus. We must imagine him devoted to the great task which he had set himself to perform, with a mind free from all disturbing cares, and in the enjoyment of all the facilities for study afforded by the Rome of Augustus, with its liberal encouragement of letters, its newly-founded libraries and its brilliant literary circles. As his work went on, the fame which he had never coveted came to him in ample measure. He is said to have declared in one volume of his history that he had already won glory enough, and the younger Pliny (Epist. ii. 3) relates that a Spaniard came all the way from Gades merely to see him, and, this accomplished, at once returned home satisfied. The accession of Tiberius (A.D. 14) materially altered for the worse the prospects of literature in Rome, and Livy retired to Padua, where he died. He had at least one son (Quinctil. x. 1. 39), who also was possibly an author (Pliny, Nat. Hist. i. 5. 6), and a daughter married to a certain L. Magius, a rhetorician of no great merit (Seneca, Controv. x. 29. 2). Nothing further is known of his personal history.

**Analysis of the History.**—For us the interest of Livy's life centres in the work to which the greater part of it was devoted, the sumptuous edition restored from fragments to the death of Drusus (9 B.C.). Its proper title was *Ab urbe condita libri* (also called *historiae* and *Annales*). Various indications point to the period from 27 to 20 B.C., as that during which the first decade was written. In the first book (10. 3) the emperor is called Augustus, a title which he assumed early in 27 B.C., and in xiv. 18 the omission of all reference to the restoration, in 20 B.C., of the standards taken at Carrhae seems to justify the inference that the passage was written before that date. In the epitome of book ix. there is a reference to a law of Augustus which was passed in 18 B.C. The books dealing with the civil wars must have been written during Augustus' lifetime, as they were read by him (Tac. Ann. iv. 34), while there is some evidence that the last part, from book cxxi. onwards, was published after his death A.D. 14.

The work begins with the landing of Aeneas in Italy, and closes with the death of Drusus (9 B.C.), though it is possible that the author intended to continue it as far as the death of Augustus. The division into decades is certainly not due to the author himself, and is first heard of at the end of the 5th century; on the other hand, the division into *libri* or *volumina* seems to be original. That the books were grouped and possibly published in sets is rendered probable both by the prefaces which introduce new divisions of the work (vi. 1, xxi. 1, xxxi. 1) and by the description in one MS. of books cxxi.-cxxvii. as "bellorum civilium libri octo." Such arrangement and publication in parts were, moreover, common with ancient authors, and in the case of a lengthy work almost a necessity.

Of the 142 *libri* composing the history, the first 15 carry us down to the eve of the great struggle with Carthage, a period, as Livy reckons it, of 488 years (xxi. 1); 15 more (xvi.-xxxi.) cover the 63 years of the two great Punic wars. With the close of book xlv. we reach the conquest of Macedonia in 167 B.C. Books lxxii.-lxxxiii. are the tributes of Tiberius Gracchus, 133 B.C. In book lxxxix. we have the dictatorship of Sulla (81 B.C.), in cii. Caesar's first consulship (59 B.C.), in cxx.-cxxvi. the civil wars to the death of Caesar (44 B.C.), in cxxiv. the battle of Brutus and Cassius at Philippi, in cxxiii. and cxxiv. the battle of Actium and the accession of Augustus. The remaining eight books give the history of the first twenty years of Augustus' reign.

Of this vast work only a small portion has come down to modern times; only thirty-five books are now extant (i.-xii., xvi.-xlv.), and of these xii. and xiii. are incomplete. The lost books seem to have disappeared between the 7th century and the revival of letters in the 15th— a fact sufficiently accounted for by the difficulty of transmitting so voluminous a work in times when printing was unknown, for the story that Pope Gregory I. burnt all the copies of Livy he could lay his hands on rests on no good evidence. Only one important fragment has since been recovered—the portion of book xci. discovered in the Vatican in 1772, and edited by Niebuhr in 1820. Very much of doubt the substance of the lost books has been preserved both by such writers as Plutarch and Dio Cassius, and by epitomizers like Florus and Eutropius. But our knowledge of their contents is chiefly derived from the so-called *libri graeci* or *libri graeci* of which we have fortunately a nearly complete series, the epitomes of books cxxvi. and cxxviii., being the only ones missing. These epitomes have been ascribed without sufficient reason to Florus (2nd century); but, though they are probably of even later date, and are disappointingly meagre, they may be taken as giving, so far as they go, a fairly authentic description of the original. They have been expanded with great ingenuity and learning by Freisheim in Drakenborough's edition of Livy. The *Prodigia* of Julius Obsequens and the list of consulae in the *Chronica* of Cassiodorus are taken directly from Livy, and to that extent reproduce the contents of the lost books. It is probable that Obsequens, Cassiodorus and the compiler of the epitomes did not use the original work but an abridgment.

**Historical Standpoint.**—If we are to form a correct judgment on the merits of Livy's history, we must, above all things, bear in mind what his aim was in writing it, and this he has told us himself in the celebratedpreface. He set himself the task of recording the history of the Roman people, "the first in the world," from the beginning. The task was a great one, and the fame to be won by it uncertain, yet it would be something to have made the attempt, and the labour itself would bring a welcome relief from the contemplation of present evils; for his readers, too, this record will, he says, be full of instruction; they are invited to note especially the moral lessons taught by the story of Rome, to observe how Rome rose to greatness by the simple virtues and unselfish devotion of her citizens, and how on the decay of these qualities followed degeneracy and decline.

He does not, therefore, write, as Polybius wrote, for students of history. With Polybius the greatness of Rome is a phenomenon to be critically studied and scientifically explained; the rise of Rome forms an important chapter in universal history, and must be dealt with, not as an isolated fact, but in connexion with the general march of events in the civilized world. Still less has Livy anything in common with the naïve anxiety of Dionysius of Halicarnassus to make it clear to his fellow Greeks that the irresistible people who had mastered them was in origin, in race and in language Hellenic like themselves.

Livy writes as a Roman, to raise a monument worthy of the greatness of Rome, and to keep alive, for the guidance and the warning of Romans, the recollection alike of the virtues which had made Rome great and of the vices which had threatened her with destruction. In so writing he was in close agreement with the traditions of Roman literature, as well as with the conception of the nature and objects of history current in his time. To a large extent Roman literature grew out of...

---

2 The various rumours once current of complete copies of Livy in Constantinople, Chios and elsewhere, are noticed by B. G. Niebuhr, *Lectures on the History of Rome from the first Punic War* (ed. L. Schmitz, 1844), l. 65.
pride in Rome, for, though her earliest authors took the form
and often the language of their writings from Greece, it was
the greatness of Rome that inspired the best of them, and it
was from the annals of Rome that their themes were taken.
And this is naturally true in an especial sense of the Roman historians;
the long list of annalists begins at the moment when the great
struggle with Carthage had for the first time brought Rome
into direct connexion with the historic peoples of the ancient
world, and when Romans themselves awoke to the importance
of the part reserved for Rome to play in universal history.
To write the annals of Rome became at once a task worthy of
the best of her citizens. Though other forms of literature might
be thought unbecoming to the dignity of a free-born citizen,
this was never so with history. On the contrary, men of high
rank and tried statesmanship were on that very account thought
all the fitter to write the chronicles of the state they had served.
And round the writer with his loss of past friendship or its
intimate and exclusive connexion with the fortunes of the
Roman people. It was well enough for Greeks to busy them-
sewls with the manners, institutions and deeds of the “peoples
outside.” The Roman historians, from Fabius Pictor to Tacitus,
cared for none of these things. This exclusive interest in Rome
was doubtless encouraged by the peculiar characteristics of the
history of the state. The Roman annalist had not, like the
Greek, to deal with the varying fortunes and separate doings
of a number of petty communities, but with the continuous life
of a single city. Nor was his attention drawn from the main
lines of political history by the claims of art, literature and
philosophy, for just as the tie which bound Romans together
was that of citizenship, not of race or culture, so the history
of Rome is that of the state, of its political constitution, its
wars and conquests, its military and administrative system.
Livy’s own circumstances were all such as to render these
virtues natural to him. He began to write at a time when, after
a century of disturbance, the mass of men had been contented
with purchase peace at the price of liberty. The present was at
least inglorious, the future doubtful, and many turned gladly
to the past for consolation. This retrospective tendency was
favourably regarded by the government. It was the policy of
Augustus to obliteriate all traces of recent revolution, and to
connect the new imperial regime as closely as possible with the
ancient traditions and institutions of Rome and Italy. The
Aeneid of Virgil, the Fasti of Ovid, suited well with his own
restoration of the ancient temples, his revival of such ancient
ceremonies as the Ludus Saeculares, his efforts to check the un-
Roman luxury of the day, and his jealous regard for the purity
of the Roman stock. And, though we are nowhere told that
Livy undertook his history at the emperor’s suggestion, it is
certain that Augustus read parts of it with pleasure, and even
honoured the writer with his assistance in his own degenerate
time. He dwells with delight on the unsellish patriotism of the
old heroes of the republic. In those times children obeyed their parents, the gods were still sincerely
worshipped, poverty was no disgrace, sceptical philosophies and
foreign fashions in religion and in daily life were unknown.
But this ethical interest is closely bound up with his Roman
sympathies. His moral ideal is no abstract one, and the virtues
he praises are those which in his view made up the truly Roman
type of character. The prominence thus given to the moral
aspects of the history tends to obscure in some degree the true
relations and real importance of the events narrated, but it
does so in Livy to a far less extent than in some other writers.
He is much too skilful an artist either to resolve his history
into a mere bundle of examples, or to overload it, as Tacitus
is sometimes inclined to do, with reflections and axioms. The
moral he wishes to enforce is usually either conveyed by the
story itself, or with the help of a single sentence. Thus:
“Hannibal, the only man an emperor’s mind could
ever place in the same rank with himself, was
never wrong in the conduct of his fortunes. He
was tenacious of his dignity, and was ever content
to risk himself with a great power and either to
secure the liberties of Italy or suffer the conmiiserate
of his life. He never, like the Grecian princes,
trusted his actions to fortune; all his efforts were
aimed at the destruction of Rome, and he sought in
his conduct the means of that destruction.”
Livy was deeply penetrated with a sense of the greatness
of Rome. From first to last its majesty and high destiny are
present to his mind. Aeneas is led to Italy by the Fates that
he may be the founder of Rome. Romulus after his ascension
declares it to be the will of heaven that Rome should be mistress
of the world; and Hannibal marches into Italy, that he may
“set free the world” from Roman rule. But, if this ever-present
consciousness often gives dignity and elevation to his narrative,
it is also responsible for some of its defects. It leads him occasion-
ally into exaggerated language (e.g. xii. 33, “nullius usquam
terrarum relicu Romanos effugiae”), or into such mis-
statements as his explanation of the course taken by the Romans
in renewing war with Carthage, that “it seemed more suitable
to the dignity of the Roman people.” Often his jealousy for the
honour of Rome makes him unfair and one-sided. In all her
wars not only success but justice is with Rome. To the
same general attitude is also due the omission by Livy of all
that has no direct bearing on the fortunes of the Roman people.
“I have resolved,” he says (xxxix. 48), “only to touch on
foreign affairs so far as they are bound up with those of Rome.”
As the result, we get from Livy very defective accounts even
of the Italic peoples most closely connected with Rome. Of
the past history and the internal condition of the more distant
nations she encountered he tells us little or nothing, even when
he found such details carefully given by Polybius.
Scarcely less strong than his interest in Rome is his interest
in the moral lessons which her history seemed to him so well
qualified to teach. This didactic view of history was a prevalent
one in antiquity, and it was confirmed no doubt by those rhetorical
studies which in Rome as in Greece formed the chief part of
education, and which taught men to look on history as little
more than a storehouse of illustrations and themes for declama-
tion. But it suited also the practical bent of the Roman mind,
with its comparative indifference to abstract speculation or
purely scientific research. It is in the highest degree natural
that Livy should have sought for the secret of the rise of Rome,
not in any large historical causes, but in the moral qualities of
the people themselves, and that he should have looked upon
the origin of that people as the only solution of the problem for the
described of his own degenerate days. He dwells with delight on the unsellish
patriotism of the old heroes of the republic. In those times
children obeyed their parents, the gods were still sincerely
worshipped, poverty was no disgrace, sceptical philosophies and
foreign fashions in religion and in daily life were unknown.
But this ethical interest is closely bound up with his Roman
sympathies. His moral ideal is no abstract one, and the virtues
he praises are those which in his view made up the truly Roman
type of character. The prominence thus given to the moral
aspects of the history tends to obscure in some degree the true
relations and real importance of the events narrated, but it
does so in Livy to a far less extent than in some other writers.
He is much too skilful an artist either to resolve his history

of priests which subtle conditions those picture imposing original in temple when temple once found pass the original by he—he—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—He—H
they slavishly clung to its substance, they succeeded, as a rule, in destroying all traces of its original form and colouring. L. Calpurnius Piso, tribune in 149 B.C. and consul in 133 B.C., prided himself on reducing the old legends to the level of common sense, and importing a new order into the action. This he did, it is true, with a view to history, a disastrous precedent he. He inserted speeches, enlivened his pages with chance tales, and aimed, as Cicero tells us, at not reducing history to the lowest terms but making it a science. His successors carried still farther the practice of dressing up the rather chronicles of earlier writers with all the ornaments of rhetoric. The old traditions were altered, almost beyond the possibility of recollection, by imaginations, invented by him, but the facts and incidents were inserted, new motifs suggested and speeches composed in order to infuse the required life and freshness into these dry bones of history. At the same time the political bias of the writers, and the political nature of their art, affected them with a political twist. some portions of the Gracchi age imported into the early struggles of patricians and plebeians the economic controversies of their own day, accounted, by no other alphabet, in the colours of the two Greek or of Saturninus. In the next generation they dexterously forced the venerable records of the early republic to pronounce in favor of the ascendency of the senate, as established by Sulla. To political bias was added family pride, for each of the parties had its own themes, the popular, the funeral panegyrics, or the imagination of the writer himself supplied an ample store of material. Pedigrees were invented, imaginary consuls and fictitious triumphs inserted, as well as the deification of princes, fully honored and incorporated with the history of the state.

Things were not much better even where the annals were dealing with recent or contemporary events. Here, indeed, their materials were naturally fuller and more trustworthy, and less room for imagination was left. But there the writers were more scrupulous, and yet there too they made use of more or less, in their representations of the facts, and of more or less, in their treatment of characters. But their methods are in the main unchanged. What they found written they copied; the gaps they supplied, where personal experience failed, by imagination. No better proof of this can be given than by a comparison of the annalists’ versions of the same events that of Polybius. In the fourth and fifth decades of Livy the two appear side by side, and the contrast between them is striking. Polybius, for instance, gives the number of the slain at Cynoscephalae as 800, whereas Livy says 4,000. In another case (xxxiii. 6) Valerius Antias, the chief of sinners in this respect, inserts a decisive Roman victory over the Macedonians, in which 12,000 of the latter were slain and 2,000 taken prisoner, an achievement never recorded by no other annalist, in the colours of the two Gracchi or of Saturninus. Such was the written tradition on which Livy mainly relied. We have next to examine the manner in which he used it, and here we are met at the outset by the difficulty of determining with exactness what authorities he is following at any one time, or for the whole of the period. He gives us, in fact, no lists of his materials, and therefore we are unable to do more than make conjectures about his sources of information. The two authorities to which he most frequently refers are Polybius and Livy himself. Piso and Calpurnius Piso (the only ones whom he there refers to by name), to whom, so far as the first book is concerned, Niebuhr (Lectures, p. 33) would add the poet Ennius. With the last of these, Livy expresses himself in such a way that it is impossible to come to any conclusion as to whether Livy is quoting Polybius or Ennius. This was a common practice at the time, and it is a safe rule to assume that Livy is quoting from Polybius and Ennius, and where he is not, he is quoting from Polybius.

In the early years, Polybius had followed the sack of Rome by the Gauls Q. Claudius Claudius, whose annals began at this point in the history. We have besides a single reference (vii. 3) to the anti-Carian Cinsus, and two (iv. 23, 24) to Polybius’ account of the First Punic War. Passing to the third decade, we find ourselves at once confronted with a question which has been long and fully discussed—whether Livy was using Polybius or First Punic War. Did Livy use Polybius at all, and, if so, to what extent?

Livy and the emperor Caligula denounced him as verbose, but with these exceptions the opinion of antiquity was unanimous in pronouncing him a consummate literary workman. The classical purity of his style, the eloquence of his speeches, the skill with which he depicted the day to day life of Rome and its history, the force of his narrative of great and in other public or private records, the same for the most part, when the city was burned, perished with it.

Thus the Romans, this, however, Livy's criticism does not go. Where his written authorities and another series of the version given by an annalist of the time, and he accepts and transcribes their record without any further inquiry, nor does he ever attempt to get behind this record in order to discover the original evidence on which it rested. His acceptance in any particular case of the version given by an annalist of the time, and the reason he gives for his preference of one account over another are eminently unscientific. Livy's history, then, rests on no foundation of original research or even of careful verification. It is a compilation, and even such a thing it leaves much to be desired. For we cannot credit Livy with having made such a preliminary survey of his authorities as would enable him to determine their relations to each other, and fuse their various narratives into a consistent whole. It is clear, on the contrary, that his circle of authorities for any one period was a comparatively small one, that of these he selected one, and transcribed him with the necessary embellishments and other slight modifications until impelled by various reasons to drop him. His method of writing, in fact, makes this clear. He pieced together the versions, each of which gave a differently coloured account of the same event. Mommsen (Rom. Forschungen, ii.) has clearly shown that this is what has happened in his relation of the legend of the golden apple. The elder Plutarch tells the story in the first sestecian, as he tells it, the older version which represented it as due to political and the later which explained it by means of a Chamagorean tradition are found side by side. Similarly a change frequently made by other later authorities, which are found from the latter statements inconsistent with those he took from the former, to forget what he has previously said, or to treat as known a fact which has not been mentioned before (cf. ii. 1, xxiv. 5, and xxv. 7). In other cases, however, in which the same event has been placed by different annalists in different years, or where their version of it varied, it reappears in Livy as two events. Thus the four campaigns against the Volsci (ill. 17 seq.) are as follows in the compila-

tion (R. 88,7): each year has its own event. Other instances of such "doublettes" are the two separate accounts described in xxviii. 46 and xxv. 18, and the two battles at Bacula in Spain (xxviii. 18 and xviii. 13). Without doubt these cases are to be explained by the chronological method by which Livy proceeds, not by the accident of having two different versions of the same event. It follows that the fact that he follows now one another, authority, heedless of their differences on this head. Thus he volatilizes the Catonian and Varroean reknov of the years, not, and between the chronologies of Polybius and the Roman annalists.

To these defects in his method must be added the fact that he does not always succeed even in accurately reproducing the authority he cites. In the narrative part of his history he has been accused of not allowing himself great freedom in omitting what strikes him as irrelevant, or tedious, or uninteresting to his Roman readers, a process in which much valuable matter disappears. In other cases his desire to produce a vividness and point to what he deems conspicuous, has led him to the rather bald and dry style of Polybius leads him into absurdities and inaccuracies. Thus by the treaty with Antiochus (188 B.C.) it was provided that the Greek communities of Asia Minor shall settle their differences with a view to the arbitrament of Rome. Livy (xxxvii. 32, 2) says that Polybius recounts the treaty, Livy (xxxvii. 35, 1) says that Polybius accounts for the Pyrenean assemblies were held. Polybius necessarily informs his readers that the Pyrenean assemblies were held. Their parties, partly carelessly, partly to misrepresentation, he may have had (xxxvii. 5 seq.) of Polybius's account. The account of the battle of Cynus in the year 307 (xxxvii. 35), not altogether acquainted on the charge of having here and there modified Polybius in the interests of Rome.

Serious as these defects in Livy's method appear if judged in the light of modern criticism, it is probable that they were easily pardoned, if indeed they were ever discovered, by his contemporaries. For it was on the artistic rather than on the critical side of history that stress was almost universally laid in antiquity, and the the former was all that was expected from the historian was not so much a scientific investigation and accurate exposition of the truth, as its skilful presentation in such a form as would charm and interest the reader. Tried by this standard, Livy deservedly won and held a place in the very first rank. Asinius Pollio sneered at his Patavinity, and the emperor Caligula denounced him as verbose, but with these exceptions the opinion of antiquity was unanimous in pronouncing him a consummate literary workman. The classical purity of his style, the eloquence of his speeches, the skill with which he depicted the day to day life of Rome and its history, the force of his narrative of great and in other public or private records, the same for the most part, when the city was burned, perished with it.
to the subject-matter. It is true that here and there the "creamy"  
richness of his style becomes verbosity, and that he occasionally  
awakens a sense of monotony on his inexhaustible store of  
epithets, metaphors and turns of speech; but these faults, which  
did not escape the censure even of friendly critics like Quintilian,  
are comparatively rare in the extant parts of his work. From the  
tendency to make his sentences too long proceeds, which was so conspicuous a fault in  
the writers of the silver age, that it was termed "Dichtung," or free verse. In his earlier  
books especially there are numerous phrases and sentences  
that are composed of an unmistakably poetic ring, recalling sometimes Ennius and  
sometimes Virgil. But in Livy this poetic element  
is kept within bounds, and serves only to give warmth and  
vivacity to the narrative. Similarly, though the influence of rhetoric  
upon his language, as well as upon his general treatment, is clearly  
perceptible, he has not to the perverted love of antithesis, paradox and  
laboured word-painting which often vitiate the prose of  
the Venetian richness of his colouring, and the copious flow of his  
words, he is on the whole wonderfully natural and simple.  

True eloquence was still less than the high tone and easy grace of his  
narrative and the eloquence of his style, he held only  
on Roman readers such as Cicero and Virgil besides himself to  
his advantage. His history formed the groundwork of nearly all that  
was later written on the subject. Plutarch, writers on rhetoric like  
the elder Seneca, moralists like Varro, Maximus, went to Livy for  
their stock examples. Florus and Eutropius abridged him; Orosius  
extracted from his prolixity the proofs of the sinful blindness of the pagan  
world; and in his works Livy was firmly established as a text-book  
for the Roman youth.

Text.—The received text of the extant thirty-five books of Livy is  
taken from different sources, and no one of our MSS, contains them  
all. An edition of the first decade, some thirty in number, are with  
one exception derived, more or less, from a single manuscript, the  
vicissitudes of which made it impossible to edit. The  
recension in the fourth century by the two Nicomachus,  
Flavianus and Dexter, and by Victorinus. This is proved in the case  
of their MSS. The first, more or less, with doubtful exceptions, is  
in the case of the MSS, unless of interest to the effect, and in the  
case of the last three MSS, unless connected with the  
Nicomachean recension, the oldest is the Codex Parisinus of the  
16th century, and the latest is the Codex Medicus or Florentinus of the  
11th. An edition, one of the chief authorities is the Codex Puteanus,  
an edition of the 4th century, now at Paris. For the fourth we  
have two leading MSS, Codex Bambergensis, 11th century, and the  
slightly older Codex Moguntius, now lost and only known through the  
Maine edition of 1518-1519. What remains of the fifth  
decade depends on the 5th century Lautriciens and Vindobonensis, and  
the monastery of Lorsch, edited at Basel in 1551.

A bibliography of the various editions of Livy, all of which  
have been written upon him, cannot be attempted here. The following  
may be of service as initial reference: W. Engelmann,  
Scrip- 
Toches Latini (8th ed., by E. Preus  
sch.)  
E. By  
graphical Cline to Latin Literature (1875);  
Teuffel-Schwebe, History  
of  
Roman Literature (Eng. trans.), 254, 257; M. Schanz, Geschichte der  
Romischen Literatur (1887, 1890). The best editions of the  
complete text are those of W. Wendland (1866-1872),  
including an introductory essay on Livy's life and writings; new edition by  
M. Muller, 1902), and J. N. Madvig and J. L. Usig (1863- 
1872). The only English translation of any merit is by Phlebon  
Holland (1800).

LIZARD

(Lat. lacerta\textsuperscript{1}), a name originally referred only to  
the small European species of four-footed reptiles, but now  
applied to a whole order (Lacertilia) which is represented by  
numerous species in all temperate and tropical regions. All  
lizards are reptiles which have a transverse external opening (usually  
of a longitudinal slit as in Crocodilians and tortoises) and which  
have the right and left halves of the mandibles connected by a  
sutural synpysis. The majority are distinguished from snakes  
by the possession of two sets of limbs, of external ear-openings  
and movable eyelids, but since in not a few of the burrowing,  
snake-shaped lizards these characters give way entirely, it  
is well-nigh impossible to find a diagnosis which should be absolutely  
sufficient for the distinction between lizards and snakes. In  
such cases of long tails, however, a number of characters have to  
be resorted to, and, while each of these may fail when taken singly,  
their combination decides the question.

It is certain that the snakes have been evolved as a specialized branch  
from some Lacertilian stock, and that both "orders" are intimately related, but it is  
significant that it is only through the degraded members of the  
1 For the etymology of this word, see Crocodile.
with other reptiles, rarely exceeding a score, and some like the anolis and the geckos deposit only one or two. The parents leave the eggs to hatch where they are deposited, in sand or in mould. Many lizards, however, retain the eggs in the oviducts until the embryo is fully developed; these species then bring forth living young and are called ovo-viviparous by purists. Some lizards possess a considerable amount of intelligence; they play with each other, become very tame, and act deliberately according to circumstances. As a rule the Iguanids and Varans are as bright as the Agamas are dull. Many have the power of changing colour, a faculty which they share only with various frogs, toads and fishes. Lizards are not poisonous, with the single exception of Heloderma.

1. Suborder, GECKONIDS. The gekkonid lizards are characterized by the naked tail, well-developed limbs, and the presence of cat-like teeth. The gekkonids are divided into two groups: the geckos (family Gekkonidae) and the Eublepharidae. The geckos are characterized by the presence of adhesive pads on their toes, which allow them to climb smooth surfaces. The Eublepharidae are characterized by the presence of a fold of skin on the back of the neck, which is used to store water.

2. Family, Gekkonidae. This family includes the geckos and their relatives. They are characterized by their ability to climb walls and ceilings, and their retractable claws. The gekkonids are divided into several subfamilies, including the Eublepharidae, the Hemidactylinae, and the Gekkoninae. The gekkonids are found in a variety of habitats, from deserts to rainforests.

3. Suborder, LACERTA. The lacertid lizards are characterized by the presence of a lamellated tongue, which they use to catch insects. The lacertid lizards are divided into several families, including the Agamidae, the Lacertidae, and the Anguinae. The lacertid lizards are found in a variety of habitats, from deserts to rainforests.

4. Family, Iguanidae. The iguanid lizards are characterized by their long, slender bodies and their ability to differentiate between different colors. They are divided into several subfamilies, including the Iguanidae, the Anolisinae, and the Dactyloidae. The iguanid lizards are found in a variety of habitats, from deserts to rainforests.

5. Suborder, CHAMELEONIDAE. The chameleonid lizards are characterized by their ability to change color and shape. They are divided into several families, including the Chamaeleonidae, the Calotesidae, and the Dactylopodidae. The chameleonid lizards are found in a variety of habitats, from deserts to rainforests.

6. Suborder, AMPHIBOLURIDAE. The amphibolurid lizards are characterized by their ability to swim in water. They are divided into several families, including the Amphiboluridae, the Ophionycteridae, and the Basiliscidae. The amphibolurid lizards are found in a variety of habitats, from deserts to rainforests.

7. Suborder, VITIDAE. The vitiid lizards are characterized by their ability to change color and shape. They are divided into several families, including the Vitidae, the Scincidae, and the Agamidae. The vitiid lizards are found in a variety of habitats, from deserts to rainforests.

8. Suborder, CHAMAEOLEONIDAE. The chamaeleonid lizards are characterized by their ability to change color and shape. They are divided into several families, including the Chamaeleonidae, the Calotesidae, and the Dactylopodidae. The chamaeleonid lizards are found in a variety of habitats, from deserts to rainforests.

9. Suborder, ANOLOGY. The anology lizards are characterized by their ability to change color and shape. They are divided into several families, including the Anolidae, the Calotesidae, and the Dactylopodidae. The anology lizards are found in a variety of habitats, from deserts to rainforests.

10. Suborder, POLYPHIDAE. The polypid lizards are characterized by their ability to change color and shape. They are divided into several families, including the Polypodidae, the Ophionycteridae, and the Basiliscidae. The polypid lizards are found in a variety of habitats, from deserts to rainforests.

11. Suborder, ANOLOGY. The anology lizards are characterized by their ability to change color and shape. They are divided into several families, including the Anolidae, the Calotesidae, and the Dactylopodidae. The anology lizards are found in a variety of habitats, from deserts to rainforests.
leaves, the latter is semi-marine, diving for the algae which grow below tide-marks. For Basiliscus see Basilisc; Iguana is dealt with under its own heading; allied is Metoponera cornuta of Hayni. Polycheles, the "chameleon," and Lidaeas are South American; Ctenosauroides of Central America and Mexico resembles the agamid Uromastix. Coryphophanes and Laemences, with only a few species, are rare inhabitants of the tropical forests of Central America and Mexico. Saurophus, Crotaphytus, Callosaurus, Holbrooki, Uma, Ula are typical Southean genera, some ranging from Oregon through Mexico. Allied is Sceloporus, with about 34 species, the most characteristic genus of Mexican lizards; only 4 species live in the United States, and only 3 or 4 are found south of the Isthmus of Tehuantepec and are restricted to Central America. The majority are lumivorous, while others are truly arboreal, e.g., S. microlepides, a species which, moreover, has the greatest possible altitudinal range, from the hot country of southern Oaxaca to the upper tree-line of Chile, about 13,000 ft. elevation; many species are viviparous. Phrynosoma, with about a dozen species, the "horned toads" of California to Texas, and through Mexico. Some of these comical-looking little creatures are viviparous, others deposit their eggs in the ground. They are well concealed by the colour of their upper parts, which in most cases agrees with the prevailing tone of their surroundings, mostly arid, stony or sandy localities; the large spikes

Family 3. Xenosauridae.—Pleuronotus; solid teeth; anterior part of tongue slightly emarginate and retractile, and covered with flat papillae; no osteoderms. Mexico.

The only representative of this family is Xenosaurus grandis, ranging from the mountains of Oaxaca, Corriola and Oaxaca. This four-footed creature is less than 1 ft. in length; the body is depressed, covered above with minute granules and tubercles; a distinct fold of skin extends from the axilla to the groin, reminding of the four-footed condition of some Anguidae, to which this singular genus seems to be allied.

Family 4. Anguidae.—Pleuronotus; teeth solid, sometimes (Ophiolaesus) grooved; anterior part of tongue emarginate and retractile; teeth on the upper jaw, beaded in some cases, are grooved; "chameleon," of California to Texas and through Mexico. Some of these comical-looking little creatures are viviparous, others deposit their eggs in the ground. They are well concealed by the colour of their upper parts, which in most cases agrees with the prevailing tone of their surroundings, mostly arid, stony or sandy localities; the large spikes

Family 5. Helodermaeidae. With Heloderma of Arizona and Mexico, and Ophiolaesus and Lanthanodons of Mesoamerica. This genus is less well known than the others; a single species, Heloderma suspectum, of the United States, is allied to the genus and is suspected of being a poisonous species; a single species, Leptodactylyus guentheri, of the United States, is allied to the genus and is suspected of being a poisonous species; a single species, Phrynosoma, with about a dozen species, the "horned toads" of California to Texas, and through Mexico. Some of these comical-looking little creatures are viviparous, others deposit their eggs in the ground. They are well concealed by the colour of their upper parts, which in most cases agrees with the prevailing tone of their surroundings, mostly arid, stony or sandy localities; the large spikes

Family 6. Aniliidae.—One genus, Anillass, with a few worm-like or snake-shaped species in California, which seem to be degraded forms of other species. The eyes are large, the teeth small and broad, the jaw constricted, the body and tail covered with soft, imbricating scales. The tongue is lilac, smooth, bident anteriorly. The few teeth are recurved, with swollen bases. The skull is much reduced. Total length of adults 8 in to 8 in.

Family 7. Zonuridae. —Pleuronotus; short, thick, scaly, strongly protractile, feebly nicked at the tip. With osteoderms at least upon the skull, where they roof in the temporal region. Africa and Madagascar.

Only 4 genera, with about 15 species. Zonurus of South Africa and Madagascar has the whole head, neck, back and tail covered with strong bony plates, the horny covering of which forms sharp spikes, and these spikes are especially developed in the skull; the tail is much shorter than the body, and the skin has a dewlap. 2. giganteus reaches 15 in. in length, and is, like the other members of the family, zoophagous. The other genera live in southern and in tropical Africa: Pseudodactylus, Platysaurus and Pseudocryptops; the last approaches the Agamidae by its snake-like body, very long tail and much reduced limbs, which in C. macrolepis are altogether absent.

Family 8. Xantusiidae. —Pleuronotus; tongue very short and scaly; no osteoderms; supratemporal fossa roofed over by the prefrontal, which is immovable; 3 temporals, 2 prefrontals, 3 postfrontals, 3 postoculars present; limbs and tail well developed. American. Xantusia (so named after Xantus, a Hungarian collector), e.g., X. nigra and a few other species from the desert tracts of Nevada and California. Anurips, e.g., An. flavomaculatum, Central America; and Cricosaurus typica in Cuba.

Family 9. Teiidae.—Teeth solid, almost acrodont; tongue long and narrow, deeply bifid, beset with papillae; no osteoderms; scales of the back very small or quite granular; limbs sometimes reduced. America.

This large, typically American family comprises more than 100 species which have been arranged in many genera. Some are entirely arboreal, others are terrestrial; many have the "chameleon." Ameiva, are strictly terrestrial, with great running powers; a few dwell below the surface and are transformed into almost limbless...
In the state of Vera Cruz. Eyes concealed. Typhlosaurus and
Feistinia in tropical Africa and Madagascar.

Family 13. Dibamidae.—Dibamus montanus—Guinea of New Guinea,
the Moucussı, Celebes and the soldiers. Tongue arrow-
shaped, covered with curved papillae. The vermiform
body is covered with cycloid imbricating scales, devoid of
osteoderms. Limbs and even their arches are absent, excepting a pair of
flaps which represent the hind-limbs in the males.

Family 14. Gerrhosauridae.—Pleurodont. Tongue long, with
papillae, like that of the Laceridae but only feebly nicked anteriorly.
Osteoderms on the head and body, roving over the temporal region.
Femoral pores present, also mostly a lateral fold. Limbs sometimes
reduced to small stumps. Tail long and brittle. The few genera
and species of this family are restricted to Africa, south of the Sahara
and Madagascar.

Gerrhosaurus, with lateral fold and complete limbs; Tetracyclus also
with a fold, but with very variable limbs; Condylurosaurus; all
in Africa. Zonosaurus and Trachelophybus in Madagascar.

Family 15. Laceridae.—Pleurodont. Tongue long and boid, with
papillae or folds, with osteoderms on the head but not on the body.
Limbs always well developed. Palaeartic and palaeotropical
with the exception of Madagascar; not in the Australian region.

The Laceridae or true lizards comprise about 20 genera, with some
100 species, most abundant in Africa; their northern limit coincides
fairly with that of the permanently frozen subsoil. They are all
terrestrial and zoophagous. The long, pointed tail is brittle.

Most of the European lizards with four well developed limbs belong
to the genus Laceria. Only three species occur in Great Britain (see
fig. 2). The common lizard (Lacerta vivipara) frequents heaths and
banks in England and Scotland, and is locally met with also in

Fig. 2.—Heads of British Lizards. a, Lacerta vivipara; b, L. agilis; c, L. viridis.

Ireland; it is viviparous. Much scarcer is the second species, the
sand-lizard (Lacerta agilis), which is confined to some localities in the
western counties of Ireland and W. of England. This species does not appear
to attain on English soil the same size as on the continent of Europe
where it abounds, growing sometimes to a length of 9 in.

Singularity, a snake (Coralia lancea), also common on the
continent, and resident principally on this lizard, has followed it across
the British Channel, apparently existing in those localities only in which
the sand-lizard has settled. This lizard is oviparous. The males
differ by their brighter green ground colour from the females, which
are brown, spotted with black. The third British species, the green
lizard (Lacerta viridis), does not occur in England proper; it
has found a congenial home in the island of Guernsey, but is there much
less developed as regards size and beauty than on the continent.

This species is larger than the two preceding; it is green, with
minute blackish spots. In Germany and France one other species only
(Lacerta muralis) appears; but in the south of Europe the
species of Lacerta are much more numerous, the largest and finest,
being L. ocellata, which grows to a length of 18 or 20 in., and
is brilliantly green, ornamented with blue eye-like spots on the sides.

Even the small island-rocks of the Mediterranean, sometimes only
a few hundred yards in diameter, are occupied by peculiar races of
lizards which have developed their peculiarities because they have
assumed under such isolated conditions a more or less dark,
almost black, coloration. L. muralis, with its numerous varieties,
has been monographed by G. A. Boulenger, Trans. Zool. Soc. xviii.

Other genera are Psammophis and Acanthodactylus in
western Europe and the western regions.

Family 16. Varanidae.—Pleurodont. Tongue very long, smooth
and boid. Osteoderms absent. Limbs always well developed. Old
World only.

This family contains only one genus, Varanus, with nearly 30
species, in Africa, Arabia and southern Asia, and Australia, but not
in Madagascar. The generic term is derived from the Arabic Ostratan,
which means lizard. Owing to a ridiculous muddle, this Arabic word
has been taken to mean "warning" lizard, hence the Latin Monitor,
one of the many synonyms of this genus, now often used as the
LLAMA, the Spanish modification of the Peruvian name of the larger of the two domesticated members of the camel tribe indigenous to South America. The llama (Lama guanicoe glama) is a domesticated derivative of the wild guanaco, which has been bred as a beast of burden. Chieflly found in southern Peru, it generally attains a larger size than the guanaco, and is usually white or spotted with brown or black. These animals are greatly used and profit to their masters, for their wool is very good and fine, particularly that of the species called pacas, which have very long fleeces; and the expense of their food is trifling, as a handful of maize suffices them, and they can go four or five days without water. Their flesh is as good as that of the fat sheep of Carthage. There are now public shambles for the sale of their flesh in all parts of Peru, which was not the case when the Spaniards came first; for when one Indian had killed a sheep his neighbours came and took what they wanted, and then another Indian killed a sheep in his turn."

The disagreeable habit of spitting is common to all the group. In a wide sense the term "llama" is used to designate all the South American Camelidae. (See Tylopoda.)

LLANBERIS, a town of Carnarvonshire, N. Wales, 84 m. E. by S. of Carnarvon, by a branch of the London & NorthWestern railway. Pop. (1901) 3015. It is finely situated in a valley near the foot of Snowdon. The valley has two lakes, Llyn Peris and Llyn Padarn, of over 1 m. and 2 m. long.
respectively, about ½ m. apart. From Padarn rises the Seint, called Rothell in its upper part. Dolbadarn Castle is a circular tower near the foot of Peris lake. Dolbadarn means the “Padarn meadow.” Several Welsh churches are dedicated to Padarn. In the castle Owen Goch (Owen the Red) was imprisoned from 1254 to 1277, by the last Llewyn, whose brother Dafydd held it for some time against Edward I. During the time of Owen Glendower (temp. Henry IV. and Henry V.), the castle often changed hands. Near is Cennanmawr waterfall. The Valeol slate quarries are here, and hence is the easiest ascent of Snowdon, with a railway to the summit. From the road over the fine Llanberis pass towards Capel Curig, a turn to the right leads to Beddgelert, through Nan Gwynnant (“white” or “happy valley,” or “stream”), where Pembroke and Teuan ap Robert (for the Lancastrians) had many skirmishes in the time of Edward IV. Gwynnant Lake is about 1 m. long by ½ m. broad, and below it is the smallest Llyn Dinas.

**Llandaff, a city of Glamorganshire, Wales, on the Taff Vale railway, 139 m. from London. Pop. (1901) 5777.** It is almost entirely within the parliamentary borough of Cardiff. It is nobly situated on the heights which slope towards the southern bank of the Taff. Fortunately the see of Llandaff was looked upon as the Welsh see of the king, but its origin is obscure. "Eboram the first two bishops, St Dubricius and St Teilo, certainly flourished during the latter half of the 6th century. By the 12th century, when Urban was bishop, the see had acquired great wealth (as may be seen from the Book of Llandaff, a collection of its records and land-grants compiled probably by Geoffrey of Monmouth), but after the reign of Henry VIII. Llandaff, largely through the alienations of its bishops and the depredations of the canons, became impoverished, and its cathedral was left for more than a century to decay. In the 18th century a new church, in debased Italian style, was planted amid the ruins. This was demolished and replaced (1844-1866) by the present restored cathedral, due chiefly to the energy of Dean Williams. The oldest remaining portion is the chancel arch, belonging to the Norman cathedral built by Bishop Urban and opened in 1130. Jasper Tudor, uncle of Henry VII., was the architect of the north-west tower, portions of which remain. The cathedral is also the parish church. The palace or castle built by Urban was converted to a residence. Owain Glyndwr is said to have been born 1404, and only a gateway with flanking towers and some fragments of wall remain. After this, Mathern near Chepstow became the episcopal residence until about 1690, when it fell into decay, leaving the diocese without a residence until Llandaff Court was acquired during Bishop Ollivant’s tenure of the see (1849-1882). For over 120 years the bishops had been non-resident. The ancient stone cross on the green (restored in 1807) is said to mark the spot on which Archbishop Baldwin, and his chaplain Giraldus Cambrensis, preached the Crusade in 1187. Money bequeathed by Thomas Howell, a merchant, who died in Spain in 1540, maintains an intermediate school for girls, managed by the Drapers’ Company, Howell’s trustees. There is an Anglican theological college, removed to Llandaff from Aberdare in 1907. The city is almost joined to Cardiff, owing to the expansion of that town.

Llandaff Court, already mentioned, was the ancient mansion of the Mathew family, from which Henry Matthews, 1st Viscount Llandaff (b. 1826), was descended. Another branch of this family formerly held the barony of Llandaff in the north shire. Henry Matthews, a barrister and Conservative M.P., whose father was a judge in Ceylon, was home secretary 1886-1892, and was created viscount in 1895.

**Llandeilo Group, in geology, the middle subdivision of the British Ordovician rocks. It was first described and named by Sir R. I. Murchison from the neighbourhood of Llandeilo in Carmarthenshire. In the type area it consists of a series of slaty rocks, shales, calcareous flagstones and sandstones; the calcareous middle portion is sometimes termed the “Llandeilo limestone”; and in the upper portion volcanic rocks are intercalated. A remarkable feature in the history of the Llandeilo rocks in Britain, more especially in North Wales and Cumberland, was the outburst of volcanic action; vast piles of Llandeilo lava and ashes form such hills as Cadar Idris, and the Arenigs in Wales, and Helvellyn and Seafell in Westmoreland and Cumberland. The series is also found at Builth and in Pembrokeshire. The average thickness in Wales is about 2000 ft. The group is usually divided in this area into three sub-divisions. In the Condon district of Shropshire the *Middleton Series* represents the Llandeilo group; it includes, in descending order, the Rorrington black shales, the *Meadownest limestones* and flags, and the western grits and shales. In the Lake District the great volcanic series of Borrowdale, green slates and porphyries, 8000 to 9000 ft. in thickness, lies on this horizon; and in the Cross Fell area the *Millburn beds* of the Skiddaw slates (see Arenig) appear to be of the same age. In Scotland the Llandeilo group is represented by the *Glenkinit shales*, black shales and yellowish mudstones with radiolarian cherts and volcanic tufts; by the *Burr Series*, including the Benan conglomerates, Stichinar limestone and Kirkland sandstones; and by the Glenapp conglomerates and Tappins mudstones and grits south of Stinchar. Graptolite shales, similar to those of southern Scotland, are traceable into the north-east of Ireland.

Within the Llandeilo group include numerous graptolites, *Coneognatus gracilis* being taken as the zonal fossil of the upper portion, *Didymograptus Muriohosi* of the lower. Other forms are *Climacograptus Scharenbergii* and *Diplograptus foliaceus*. Many trilobites are found in these rocks, e.g. *Ogygo Buchi, Asaphus tubus, Gymnophyllum*, and *Calymene camerinii, Chetnurus sedgwicki*. Among the brachiopods are *Crania, Lepisma, Lingula, Strophomena; Cardiola* and *Meditobloma* occur among the Pelecypods; *Esomphalus, Bellerophon, Murchisonia* among the Gasteropods; *Conularia and Hylolithes* among the Pteropods; the Cephalopods are represented by *Orthoceras* and *Cyrtoceara*. The green roofing slates and plumbo (graphite) of the Lake District are obtained from this group of rocks. (see Ordovician).
The place probably owes its Celtic name of Llan-yd-ddlyfri (the church amid the waters) to the proximity of Llandinat church to the streams of the Towy, Brân and Gwyder. Of the latter stretching along the head of the fertile vale of Towy, Llandinwy was a strategic site of some importance in the middle ages. The castle erected here by the Normans early in the 12th century frequently changed owners during the course of the Anglo-Welsh wars before 1282. In 1485 the borough of Llandinwy, or Llanymthwery, was incorporated by a charter from Richard III., and this king's privileges were subsequently confirmed by Henry VIII. in 1521, and by Elizabeth in 1590, the Tudor queen's original charter being still extant and in the possession of the corporation, which is officially styled "the bailiff and burgesses of the borough of Llanymthwery, otherwise Llandinwy." The bailiff likewise holds the office of recorder, but has neither duties nor emoluments.

In the 17th century the vicarage of Llandinwy was held by the celebrated Welsh poet and preacher, Rhys Frichard, commonly called "the vicar of Llandinwy" (d. 1644). In the middle of the 19th century William Rees of Tonn published at Llandinwy many important works dealing with early Welsh history and archæology.

**LLANDINWY GROUP,** in geology, the lowest division of the Silurian (Upper Silurian) in Britain. C. Lapworth in 1879 proposed the name **Valentinian** (from the ancient north British province of Valenlia) for this group. It includes the type area the Tarannon Shales 1000-1500 ft., Upper Llandinwy and May Hill Sandstone 800 ft., Lower Llandinwy, 600-1500 ft.

The Lower Llandinwy rocks consist of conglomerates, sandstones and slaty beds. At Llandinwy they rest unconformably upon Ordovician rocks (Bala), but in many other places no unconformity is traceable. These rocks occur with a narrow crop in Pembrokeshire, which curves round through Llandinwy, and in the Rhayader district they appear to be the thickest of all the thinnest of beds towards Bala Lake. They occur also in Cardiganshire and Carmarthenshire in many places where they have not been clearly separated from the associated Ordovician rocks.

There is a change in the fauna on leaving the Ordovician and entering the Llandinwy. Among the graptolites the Diplograptidae begin to be replaced by the Monograptidae. Characteristic graptolite zones, in descending order, are:—Monograptus gutterius, Diplograptus mesoleptus, D. acuminatus. Common trilobites are:—Ascorasps, Encrinurus, Phacops, Protrus; among the brachiopods are Orthas elegans, O. testudinaria, Meristella crassa and Pentamerus (Stricklandia) long. **Pentamerus** is so characteristic of the Llandinwy rocks that the correct determination of both the narrow outcrop in Carmarthenshire at the base of the Silurian, disappearing beneath the Old Red Sandstone, and in Pembrokeshire, north-eastward the outcrop extends to the Longmynd, which the conglomerate wraps round. As it is followed also elsewhere, it seems probable that the Lower Llandinwy, Cardiac, Llandineo, Cambrian and pre-Cambrian rocks.

The fossils include the trilobites Phacops caudatus, Encrinurus punctatus, Cyclostoma spiculatum; the brachiopods Pentamerus abderus, Orthas elegans, O. testudinaria, Meristella crassa and **Pentamerus** (Stricklandia) long. Among the graptolites, the genus Diplograptus is especially characteristic of the Llandinwy Fauna. In the Lower Llandinwy, Cardiac, Llandineo, Cambrian and pre-Cambrian rocks.

The Lower Llandinwy rocks consist of conglomerates, sandstones and slaty beds. At Llandinwy they rest unconformably upon Ordovician rocks (Bala), but in many other places no unconformity is traceable. These rocks occur with a narrow crop in Pembrokeshire, which curves round through Llandinwy, and in the Rhayader district they appear to be the thickest of all the thinnest of beds towards Bala Lake. Among the graptolites, the genus Diplograptus is especially characteristic of the Llandinwy Fauna. In the Lower Llandinwy, Cardiac, Llandineo, Cambrian and pre-Cambrian rocks.

The **Llandinwy** group, **Llandinwy Wells**, a market town, urban district and health-resort of Radnorshire, Wales, situated in a lofty and exposed district near the river Ithon, a tributary of the Wye. Pop. (1901) 1827; Llandinwy is a station on the Mid-Wales section of the London & North-Western railway. The town annually receives thousands of visitors, and lies within easy reach of the beautiful Wye Valley and the wild district of Radnor Forest. The saline, sulphur and chalybeate springs of Llandinwy have long been famous. According to a treatise on the geology of Germany published by Dr. Pease, Llandinwy contains the saline springs at Ffynwy-lwyn-y-gog ("the well in the cuckoo's grove") in the present parish of Llandinwy had acquired more than a local reputation as early as the year 1666. In the 18th century both saline and sulphur springs were largely patronized by numbers of visitors, and about 1749 a Mr Grovenor built a hydropathic establishment near the old church, on a site now covered by a farm-house known as Llandinwy Hall.

**Llandudno**, a seaside resort in the Arfon parliamentary division of Carnarvonshire, North Wales, in a detached portion of the county east of the Conway, on a strip of sandy soil terminating in the massive limestone of Great Orme's Head. Pop. of urban district (1901) 9770. The town is reached by the London & North-Western railway, and lies 227 m. N.W. of London. A village in 1850, Llandudno is 10-day one of the most flourishing watering-places in North Wales. Sheltered by the Great Orme on the N.W. and by the Little Orme on the E., it faces a wide bay of the Irish Sea, and is backed by low sandhills. A Marine Pier circles the bathing beaches. The Little Orme has caverns and abounds in sea-beds. The sea-front of the town are the Gloddaeth woods, open to visitors. On the Great Orme are old circular buildings, an ancient fortress, a "rocking-stone" (côd Tudno) and the 7th-century church of St Tudno, restored in 1885. Druidical and other British antiquities are numerous in the district. At Deganwy, or Diganwy, 2 m. from Llandudno, is a castle, Dinas Gonwy (Conwy fort), known to English historians as Gannoc, dating from the 11th or (according to the Welsh) earlier than the 9th century.

**Llanelli**, a market town, urban district, and seaport of Carmarthenshire, Wales, situated on the north shore of the broad estuary of the river Loughor (Llchwfr), known as Burry river, which forms an inlet of Carmarthen Bay. Pop. (1901) 25,017. Llanelli is a station on the South Wales section of the Great Western railway. The town is wholly of modern appearance. The mother-church of St Eiulf, or Eiul (whence the town derives its name) has been practically rebuilt (1906), but it retains its 13th-century tower and other ancient features of the original fabric. Its situation on a broad estuary and its central position regard the SS. &c., and the coastal and limestone, have combined to make Llanelli one of the many important industrial towns of South Wales. Anthracite and steam-coal from the colliers of the coast and along the Loughor Valley are exported from the extensive docks; and there are also large works for the smelting of copper and the manufacture of tin plates.

Llanelli, though an ancient parish and a borough by prescription under a portreeve and burgesses in the old lordship of Kidwelly, remained insignificant until the industrial development in South Wales during the 19th century. In 1810 the combined population of Llanelli, with its four subsidiary hamlets...
of Berwick, Glam, Hencoed and Westowe, only amounted to 2072; in 1840 the inhabitants of the borough hamlet alone had risen to 4173. Llanell is now the most populous town in Wales outside the confines of Glamorganshire. In 1832 Llanell was added as a contributory borough to the Carmarthen parliamentary district.

Llanes, a seaport of northern Spain, in the province of Oviedo, on the river Carucedo and the Bay of Biscay. Pop. (1900) 18,684. The streets are mostly narrow and irregular, and contain some curious old houses. The principal buildings are a fine Gothic church and an old Augustinian monastery, which has been converted into a school and meteorological station. In summer the fine climate, scenery and sea-bathing attract many visitors. Llanes is a second-class port for light-draught vessels; but the entrance is narrow, and rather difficult in rough weather. The trade is chiefly in agricultural produce, timber, butter and fish.

Llanolonn, a picturesque market-town and summer resort of Denbighshire, N. Wales, in the Dee (Dyfed) valley, on a branch of the Great Western Railway, 9 m. S.W. of Wrexham, 2021 m. from London by rail. Pop. of urban district (1901) 3303. The Dee is here crossed by a 14th-century bridge of four arches, "one of the seven wonders of Wales," built by John Trevor, afterwards Bishop of St. Asaph (Llanes). The Anglican church of St. Colen, Norman and Early English, has a monument in the churchyard to the "Ladies of Llanell," Lady Eleanor Butler and Hon. Sarah Ponsonby, of Plas Newyd, (1778 to 1829 and 1831 respectively). The house is now a museum. Castell Dinas Brân (the castle of the town of Brân; the stream below is called Brân), the ruined remains of a fortress on a high conical hill about 1 m. from the town, is supposedly British, of unknown date. "An old ruyenous thinge," as the Elizabethan poet Churchyard calls it even in the 16th century, it was inhabited, apparently, about 1390, by Myfanwy Fehan of the Tudor Trevor family and beloved by the bard Howel ab Einion Lligwy, whose ode to her is still extant. Valle Crucis Abbey (Llan Egwst) is a Cistercian ruin at the foot of Bronfawr hill, some 2 m. N.W. of Llanolonn, founded about 1200 by Madoc ab Gruffydd Maelor, lord of Dinas Brân and grandson of Owen Gwynedd, prince of Wales. Llan Egwst, dissolved in 1535, was given by James I. to Lord Edward Wootton. In the meadow adjoining, still called Llwyn y Groes ('grove of the cross'), is "Elsig's Pillar." Elsiog was father of Brochmael, prince of Powys, and his grandson, Concen or Congen, appears to have been a man of some importance, his name occurring in the Magna Charta. The inscription; the modern inscription dates only from 1770. At Llanolonn are linen and woollen manufactures, and near are collieries, lime and iron works. Brewing, melting and slate-quarrying are also carried on. Within the parish, an aqueduct carries the Elmesere canal across the Dee.

Llanquihue (pron. lan-kwe-wu), a province of southern Chile bordering on the northern shores of the Gulf and Straits of Chacao, and extending from the Pacific to the Argentinian frontier. The province of Valdivia lies N. and is separated from it in part by the Bueno river. Pop. (1895) 28,315. Area 45,515 sq. m. It is a region of forests, rivers and lakes, and the greater part is mountainous. The rainfall is excessive, the average at Puerto Montt being 104 in. a year, and the temperature is singularly uniform, the average for the summer being 58°, and of the winter 47°, and of the year 53° C. There are several large lakes in the eastern part of the province—Puyehue, on the northern frontier, Rupanco, Llanquihue and Todos los Santos. Lake Llanquihue is the largest body of fresh water in Chile, having an extreme length from N. to S., or from Octai to Varas, of about 33 m., and extreme breadth of nearly the same. There is a regular steamship service on the lake between Octai and Varas, and its western shores are well settled. The volcanoes of Calbuco and Osorno rise from near its eastern shores, the latter to a height of 7382 ft. The outlet of the lake is through Maullin river, the lower course of which is navigable. The other large rivers of the province are the Bueno, which receives the waters of Lakes Puyehue and Rupanco, and the Puelo, which has its rise in a lake of the same name in the Argentine territory of Chubut. A short tortuous river of this vicinity, called the Petrohue, affords an outlet for the picturesque lake of Todos los Santos, and enters the Reloncavi Inlet near the Puelo. The southern coast of the province is indented by a number of inlets and bays affording good fishing, but the mouths of the rivers flowing into the Pacific are more or less obstructed by sand-bars. Apart from the lumber industry, which is the most important, the productions of Llanquihue include wheat, barley, potatoes and cattle. The white population is composed in great part of Germans, who have turned large areas of forest lands in the northern districts into productive wheat fields. The capital is Puerto Montt, on a nearly land-locked bay called the Reloncavi, designed to be the southern terminus of the longitudinal railway from Tacna, a distance of 2152 m. An important town in the northern part of the province is Osorno, on the Reloncavi, which is chiefly inhabited by Germans. It exports wheat and other farm produce, leather, lumber and beer.

Llantrisant, a small town and a contributory parliamentary borough of Glamorganshire, Wales, picturesquely situated with a southern aspect, commanding a fine view of the vale of Glamorgan, in a pass on the mountain range which separates that vale from the valley of the Taifi. The population of the parish in 1901 was 10,001 and of the contributory borough 2057. A branch of the Taifi Vale railway running from Pontypidd to Cowbridge and Aberthaw has a station, Cross Inn, 3 m. below the town, while nearly 2 m. farther south it passes (near the village of Pontyclun) through Llantrisant station on the Great Western railway main line, which is 1361 m. by rail from London and 11 m. N.W. from Cardiff. The castle, which according to G. T. Clark was "second only to Cardiff in military importance," dates from the reign of Henry III. or Edward I. Of the original building nothing remains, and of a later building only a tall and slender fragment. It was the head of the lordship of Miskin, a great part of which was in the hands of native owners, until the last of them, Howel ap Meredith, was expelled by Richard de Clare (1220-1262). Since then it has always been in the hands of the lord of Glamorgan. It was in the near neighbourhood of the town that Edward II. was captured in 1327. In 1426 the then lord of Glamorgan, Richard, 5th earl of Warwick, granted to the residents a charter confirming grants made by his predecessors in 1346, 1537 and 1424. The corporation was abolished in 1885, and its property (including 284 acres of common land) is administered by a town trust under a scheme of the Charity Commission for Wales. The "commons" of the borough, however, still hold a court leet in the town-hall. The market formerly held here has been discontinued, but there are four annual fairs. The church was dedicated to three saints (Illtyd, Gwyno and Tyfodwg), whence the name Llantrisant. Originally a Norman building, most of the present fabric belongs to the 15th century. There are numerous chapels. Welsh is still the predominant language. Oliver Cromwell's forbearers were natives of this parish, as also was Sir Leoline Jenkins, secretary of state under Charles II. There are innumerable works at Pontyclun and numerous collieries in the district.

Llantwit Major (Welsh Llan-Illtyd-Fawr), a small market town in the southern parliamentary division of Glamorganshire, South Wales, about 1 m. from the Bristol Channel, with a station on the Barry railway. 5 m. S. of Cowbridge. Pop. (1901) 1113. About 1 m. N.N.W. of the town there were discovered in 1888 the remains of a large Roman villa within a square enclosure of about 8 acres, which has been identified as part of the site of a Roman settlement mentioned in Welsh writings as Caer Wrgan. The building seemed to have been the scene of a massacre, possibly the work of Irish pirates in the 5th century, as some forty-three human skeletons and the remains of three horses were found within its enclosure. Etymological reasoning has led some to suggest that the Roman station of Bovium was at Boverton, 1 m. E. of the town, but it is more likely to have been at Ewenny (2 m. S.E. of Bridgend) or perhaps at Cowbridge. On the sea coast are two camps, one known as Castle Ditches, commanding the entrance to the creek of Colugh, once the port
of Llanwit. In the time of Henry I. a small colony of Flemings settled in the district. The town and church derive their name from St Illtyd or Ilutius, styled the "knight," a native of Brittany and a great-nephew of Germanus of Auxerre. Having come under the influence of St Cadoc, abbot of Llancarvan, 6 m. E.N.E. of Llanwit, Iltyd established at the latter place, about A.D. 520, a monastic college which became famous as a seat of learning. He attracted a number of scholars to him, especially from Brittany, including Samson, archbishop of Dol, Maglorius (Samson's successor) and Paul de Leon, while his Welsh students included David, the patron saint of Wales, Gildas the historian, Paulinus and Teilo. The college continued to flourish for several centuries, sending forth a large number of missionaries until, early in the 12th century, its revenues were appropriated to the abbey of Tewkesbury by Fitzhamon, the first Norman lord of Glamorgan. A school seems, however, to have lingered on in the place until it lost all its emolument in the reign of Henry VIII. The present church of St Iltyd is the result of a sequence of churches which have sprung from a pre-Norman edifice, almost entirely rebuilt and greatly extended in the 13th century and again partially rebuilt late in the 14th century. The "church which the knight" (according to Professor Freeman) belonged probably to the monks, and is the only part now used for worship, a western one used as a parochial church before the dissolution, but now disused, and still farther west of this a chantry with sacristian's house, now in ruins. The western church consists of the nave of a once cruciform building, while in continuation of it was built the eastern church, consisting of chancel, nave (of great height and width but very short), aisles and an embattled western tower built over the junction of the two naves. A partial restoration was made in 1888, and a careful and more complete one in 1900-1905.

In the church and churchyard are preserved some early monumental remains of the British church, dating from the 9th century, and some possibly from an earlier date. They include two cross-shafts and one cross with inscriptions in debased Latin (one being to the memory of St Iltyd) and two cylindrical pillars, most of them being decorated with interlaced work. There are some good specimens of domestic architecture of the 17th century. The town is situated in a fertile district and the inhabitants depend mainly on agriculture; the town is the residence chiefly to its stock sales. St Donats castle, 2 m. to the west, was for nearly seven centuries the home of the Stradling family.

As to the Roman remains, see the *Athenæum* for October 20 (1888), and the *Antiquary* for August (1892). As to the church, see the *Archaeologia Cambrensis*, 3rd ser., iv. 31 (an article by Professor Freeman), 5th ser., v. 409 and xvi. 129, and 6th ser., v. 56; A. C. Fryer, *Llantwit-Majör: a Fifth Century University* (1893).

(D. Ll. T.)

**LLANWRTYD WELLS**, an urban district of Breconshire, south Wales, with a station on the central Wales section of the London & North Western railway, 231 m. from London. It is situated in the midst of wild mountain scenery on the river Iton, a right-bank tributary of the Wye. The place is chiefly noted for its sulphur and chalybeate springs, the former being the strongest of the kind in Wales. The medicinal properties of the sulphur water were discovered, or perhaps rediscovered, in 1732 by a famous Welsh writer, the Rev. Theophilus Evans, then vicar of Llangamarch, to which living Llanwrtyd was a chapelry till 1871. Saline water is obtained daily in the season from Buitll Wells. The Iton is celebrated as a trout-stream. Out of the civil parish, which has an area of 10,785 acres and had in 1901 7144 acres, and had 7144 persons living in the urban district, comprising 1611 acres, and with an estimated population at the date of formation of 812. Welsh is the pre-dominant language of the district.

Four miles lower down the Iton valley, at the junction of the Cammarch and Iton, and with a station on the London & North Western railway, is the village of Llangamarch, noted for its barium springs. The ancient parish of Llangamarch consists of the townships of Penbualt and Treffils, the wells being in the former, which comprises 11,152 acres and had in 1901 a population of only 433. John Penny, the Puritan martyr, was born at Cefn-brith in this parish. Charles Wesley's wife, Sarah Gwynne, was of Garth, an old residence just outside the parish.

**LLEWELYN I., the name of two Welsh princes.**

**LLEWELYN I., ab Iorwerth (d. 1240), prince of North Wales, was born after the expulsion of his father, Iorwerth, from the principality. In 1194, while still a youth, Llewelyn recovered the paternal inheritance. In 1201 he was the greatest prince in Wales. At first he was a friend of King John, whose illegitimate daughter, Joanna, he took to wife (1201); but the alliance soon fell through, and in 1211 John reduced Llewelyn to submission. In the next year Llewelyn recovered all his losses in North Wales. In 1215 he took Shrewsbury. His rising had been encouraged by the pope, by France, and by the English barons. His rights were secured by special clauses in Magna Carta. But he never desisted from his wars with the Marchers of South Wales, and in the early years of Henry III. he was several times attacked by English armies. In 1230 he was struck with paralysis and retired from the active work of government in favour of his son David. He retired into a Cistercian monastery.

**LLEWELYN II., ab Gruffydd (d. 1282), prince of North Wales, succeeded his uncle David in 1246, but was compelled by Henry III. to confine himself to Snowdon and Anglesey. In 1254 Henry granted Prince Edward the royal lands in Wales. The steady encroachment of royal officers on Llewelyn's land began immediately, and in 1256 Llewelyn declared war. The Barons' War engaged all the forces of England, and he was able to make himself lord of south and north Wales. Llewelyn also assisted the barons. By the treaty of Shrewsbury (1265) he was recognized as overlord of Wales; and in return Simon de Montfort was supplied with Welsh troops for his last campaign. Llewelyn refused to do homage to Edward I., who therefore attacked him in 1276. He was besieged in the Snowdon mountains till hunger made him surrender, and conclude the humiliating treaty of Conway (1277). He was released, but in 1282 he treacherously surprised and was killed in a skirmish with the Mortimers, near Builth in central Wales.

**LORENTE, JUAN ANTONIO** (1756–1823), Spanish historian, was born on the 30th of March 1756 at Rincon de Soto in Aragon. He studied at the university of Saragossa, and, having been ordained priest, became vicar-general to the bishop of Calahorra in 1782. In 1785 he became commissary of the Holy Office at Logroño, and in 1789 its general secretary at Madrid. In the crisis of 1808 Llorente identified himself with the Bonapartist faction, and was engaged for a few years in superintending the execution of the decree for the suppression of the monastic orders, and in examining the archives of the Inquisition. On the return of King Ferdinand VII. to Spain in 1814 he withdrew to France, and published his great work *Historia crítica de la inquisición de España* (Paris, 1815-1871). Translated into English, French, German, Dutch and Italian, it attracted much attention in Europe, and involved its author in considerable persecution, which, on the publication of his *Portraits politiques des papes* in 1822, culminated in a peremptory order to quit France. He died at Madrid on the 5th of February 1823. Both the personal character and the literary accuracy of Llorente have been assailed, but although he was not an exact historian there is no doubt that he made an honest use of documents relating to the Inquisition which are no longer extant.

The English translation of the *Historia* (London, 1826) is abridged. Llorente also wrote *Memorias para la historia de la revolución española* (Paris, 1814–1816), translated into French (Paris, 1815–1816); *Noticias historicas sobre las tres prisiones de nuestros* (Madrid, 1806–1808); an autobiography, *Noticia biográfica* (Paris, 1818), and other works.
LLOYD, EDWARD (1845— ), English tenor vocalist, was born in London on the 7th of March 1845, his father, Richard Lloyd, being vicar choralist at Westminster Abbey. From 1852 to 1860 he sang in the abbey choir, and was regularly trained in music, eventually becoming solo tenor at the Chapel Royal. He began singing at concerts in 1867, and in 1871 appeared at the Gloucester Musical Festival. His fine evenly-produced voice and pure style at once brought him into notice, and he gradually took the place of Sims Reeves as the leading English tenor of the day, his singing of classical music, and especially of Handel, being particularly admired. At the Handel Festivals after 1888 he was the principal tenor, and even in the vast auditorium at the Crystal Palace he triumphed over acoustic difficulties. In 1888, 1890 and 1892 he paid successful visits to the United States; but by degrees he appeared less frequently in public, and in 1900 he formally retired from the platform.

LLOYD, WILLIAM (1627—1717), English divine, successively bishop of St Asaph, of Lichfield and Coventry, and of Worcester, was born at Tiblehurst, Berkshire, in 1627, and was educated at Oriel and Jesus Colleges, Oxford. He graduated M.A. in 1646. In 1663 he was prebendiary of Ripon, in 1667 prebendiary of Salisbury, in 1668 archdeacon of Merioneth, in 1672 dean of Bangor and prebendiary of St Paul's, London, in 1680 bishop of St Asaph, in 1689 lord-almoner, in 1692 bishop of Lichfield and Coventry, and in 1699 bishop of Worcester. Lloyd was an indefatigable opponent of the Roman Catholic tendencies of James II., and was one of the seven bishops who for refusing to have the Declaration of Indulgence read in his diocese was charged with publishing a seditious libel against the king and acquitted (1688). He engaged Gilbert Burnet to write The History of the Reformation of the Church of England and provided him with much material. He was a good scholar and a keen student of biblical apocalyptic literature and himself "prophesied" to Queen Anne, Robert Harley, earl of Oxford, William Whiston, and John Evelyn the diarist. Lloyd was a staunch supporter of the revolution. His chief publication was An Historical Account of Church Government as it was in Great Britain and Ireland when they first received the Christian Religion (London, 1684, reprinted Oxford, 1842). He died at Harteby castle on the 30th of August 1717.

LLOYD, WILLIAM WATKISS (1832—1893), English man of letters, was born at Homerton, Middlesex, on the 11th of March 1832. He received his early education at Newcastle-under-Lyme grammar school, and at the age of fifteen entered a family business in London, with which he was connected for thirty-five years. He devoted his leisure to the study of art, architecture, archaeology, Shakespeare, classical and modern languages and literature. He died in London on the 22nd of December 1893. The work by which he is best known is The Age of Pericles (1875), characterized by soundness of scholarship, great learning, and a thorough appreciation of the period with which it deals, but rendered unattractive by a difficult and at times obscure style. He wrote also: Xanthian Marbles (1845); Critical Essays upon Shakespeare's Plays (1875); Christianity in the Cartoons [of Raphael] (1865), which excited considerable attention from the manner in which theological questions were discussed; The History of Sicily to the Athenian War (1872); Panics and their Panacea (1866); an edition of Much Ado about Nothing, "now first published in fully recovered metrical form" (1884); the author held that all the plays were originally written in blank verse). A number of manuscripts still remain unpublished, the most important of which have been bequeathed to the British Museum, amongst them being: A Further History of Greece: The Century of Michael Angelo; The Neo-Platonists.

See Memoir by Sophia Beale prefixed to Lloyd's (posthumously published) Elijah Fenian: his Poetry and Friends (1894), containing a list of published and unpublished works.

LLOYD GEORGE, DAVID (1835— ), British statesman, was born at Manchester on the 17th of January 1835. His father, William George, a Welshman of yeoman stock, had left Pembrokehire for London at an early age and became a school teacher there, and afterwards in Liverpool and Haverfordwest, and then headmaster of an elementary school at Pwllheli, Carnarvonshire, where he married the daughter of David Lloyd, a neighbouring Baptist minister. Soon afterwards William George became headmaster of an elementary school in Manchester, but after the birth of his eldest son David his health failed, and he gave up his post and took a small farm near Haverfordwest. Two years later he died, leaving his widow in poor circumstances; a second child, another son, was posthumously born. Mrs George's brother, Richard Lloyd, a shoemaker at Llanystumdwy, and pastor of the Cambellite Baptists there, now became her chief support; it was from him that young David obtained his earliest views of practical and political life, and also the means of starting, at the age of fourteen, on the career of a solicitor.

Having passed his law preliminary, he was articled to a firm in Portmadoc, and in 1854 obtained his final qualifications. In 1868 he married Margaret, daughter of Richard Owen of Crineth. From this first he managed to combine his solicitor's work with politics, becoming secretary of the South Carnarvonshire Anti-tithe League; and his local reputation was made by a successful fight, carried to the High Court, in defence of the right of Nonconformists to burial in the parish churchyard. In the first county council elections for Carnarvonshire he played a strenuous part on the Radical side, and was chosen an alderman; and in 1890, at a by-election for Carnarvon Boroughs, he was returned to parliament by a majority of 15 over a strong Conservative opponent. He held his seat successfully at the contests in 1892, 1895 and 1900, his reputation as a champion of Welsh nationalism, Welsh nonconformity and extreme Radicalism becoming thoroughly established both in Parliament and in the country. In the House of Commons he was one of the most prominent guerrilla fighters, conspicuous for his audacity and pungency of utterance, and his capacity for obstruction while the Conservatives were in office. During the South African crisis of 1899—1902 he was specially vehement in opposition to Mr Chamberlain, and took the "pro-Boer" side so bitterly that he was mobbed in Birmingham during the 1900 election when he attempted to address a meeting at the Town Hall. But he was again returned for Carnarvon Boroughs; and in the ensuing parliament he came still more to the front by his resistance to the Education Act of 1902.

As the leader of the Welsh party, and one of the most dashing parliamentarians on the Radical side, his appointment to office when Sir H. Campbell-Bannerman became premier at the end of 1905 was generally expected; but his elevation direct to the cabinet as president of the Board of Trade was somewhat of a surprise. The responsibilities of administration have, however, often converted a political free-lance into a steady-going official, and the Unionist press did its best to encourage such a tendency by continual praise of the departmental action of the new minister. His settlement of the railway dispute in 1906 was universally applauded; and the bills he introduced and passed for reorganizing the port of London, dealing with Merchant Shipping, and enforcing the working in England of patents granted there, and so increasing the employment of British labour, were greeted with satisfaction by the tariff-reformers, who congratulated themselves that a Radical free-trader should thus throw over the policy of laissez faire. The president of the Board of Trade was the chief success of the ministry, and when Mr Asquith became premier in 1908 and promoted Mr Lloyd George to the chancellorship of the exchequer, the appointment was well received even in the City of London. For that year the budget was already settled, and it was introduced by Mr Asquith himself, the ex-chancellor; but Mr Lloyd George came at once to the Treasury and in parliament, by his industry and his handling of the Finance Bill, especially important for its inclusion of Old Age Pensions in later stages.

It was not till the time came nearer for the introduction of the budget for 1909—10 that opinion in financial circles showed the change which was afterwards to become so marked. A considerable deficit, of about £16,000,000, was in prospect, and the
chancellor of the exchequer aroused misgivings by alluding in a speech to the difficulty he had in deciding what "hen roost" to robb. The government had been losing ground in the country, and Mr Lloyd George and Mr Winston Churchill were conspicuously in alliance in advocating the use of the budget for introducing drastic reforms in regard to licensing and land, which the resistance of the House of Lords prevented the Radical party from effecting by ordinary legislation. The well-established doctrine that the House of Lords could not amend, though it might reject, a money-bill, coupled with the fact that it never had gone so far as to reject a budget, was relied on by the extremists as dictating the obvious party tactics; and before the year 1909 opened, the possibility of the Lords being driven to compel a dissolution by standing on their extreme rights as regards the financial provision for the year was already canvassed in political circles, though it was hardly credited that the government would precipitate a constitutional crisis of such magnitude.

When Mr Lloyd George, on the 29th of April, introduced his budget, its revolutionary character, however, created widespread dismay in the City and among the propertied classes.

In a very lengthy speech, which had to be interrupted for half an hour while he recovered his voice, he ended by describing it as a "war budget," against poverty, which he hoped, in the result, would become "as remote to the people of this country as the wolves which once infested its forests." Some of the original proposals, which were much criticized, were subsequently dropped, including the permanent diversion of the Old Sinking Fund to a National Development Fund (created by a separate bill), and a tax on "ungotten minerals," for which a new Royal Commission was appointed. But the main features of the budget were adhered to, and eventually passed the House of Commons on the 4th of November, in spite of the persistent opposition of the scantly Unionist minority. Apart from certain non-contentious provisions, such as a tax on motor-cars, the main features of the measure were large increases in the import and tobacco duties, license duties, estate, legacy and succession duties, and income tax, and an elaborate and novel system of duties on land-values ("increment duty," "reversion duty," "undeveloped land duty"), depending on the setting up of arrangements for valuation of a highly complicated kind. The discussions on the budget entirely monopolized public attention for the year, and while the measure was defended by Mr Lloyd George in parliament with much suavity, and by Mr Asquith, and Lord Grey amid much suavities, in the House of Commons with tact and moderation, the feelings of its opponents were exasperated by a series of inflammatory public speeches at Limehouse and elsewhere from the chancellor of the exchequer, who took these opportunities to rouse the passions of the working-classes against the landed classes and the peers. When the Finance Bill went up to the House of Lords, Lord Lansdowne gave notice that on the second reading he would move "that this House is not justified in giving its consent to this bill until it has been submitted to the judgment of the country," and on the last day of November this motion was carried by an overwhelming majority of peers. The government passed a solemn resolution of protest in the House of Commons and appealed to the country; and the general election in January took place amidst exaggerated excitement. The Unionists gained a hundred seats over their previous numbers, but the constitutional issue undoubtedly helped the government to win a victory, depending indeed solely on the votes of the Labour members and Irish Nationalists, a year before which had seemed improbable.

Events had now made Mr Lloyd George and his financial policy the centre of the Liberal party programme; but party tactics for the moment prevented the ministry, who remained in office, from simply sending the budget up again to the Lords and allowing them to pass it. There was no majority in the Commons for the budget as such, since the Irish Nationalists only supported it as an engine for destroying the veto of the Lords and thus preparing the way for Irish Home Rule. Instead, therefore, of proceeding with the budget, the government allowed the financial year to end without one, and brought forward resolutions for curtailing the powers of the Lords, on which, if rejected by them, another appeal could be made to the people (see PARLIAMENT). Hardly, however, had the battle been arrayed when the King's death in May upset all calculations. An immediate continuance of hostilities between the two Houses was impossible. A truce was called, and a conference arranged between four leaders from each side—Mr Lloyd George being one—to consider whether compromise on the constitutional question was not feasible. The budget for 1909—10 went quietly through, and before the August adjournment the chancellor introduced his budget for 1910—11, discussion being postponed till the autumn. It imposed no new taxation, and left matters precisely as they were. (H.C.)

LLOYD'S, an association of merchants, shipowners, underwriters, and ship and insurance brokers, having its headquarters in a suite of rooms in the north-east corner of the Royal Exchange, London. Originally a mere gathering of merchants for business or gossip in a coffee-house kept by one Edward Lloyd in Tower Street, London, the earliest notice of which occurs in the London Gazette of the 18th of February 1688, this institution has gradually become one of the greatest organizations in the world in connexion with commerce. The establishment existed in Tower Street up to 1692, in which year it was removed by the proprietor to Lombard Street, in the centre of that portion of the city most frequented by merchants of the highest class. Shortly after this event Mr Lloyd established a weekly newspaper furnishing commercial and shipping news, in those days an undertaking of no small difficulty. This paper took the name of Lloyd's News, and though its life was not long it was the precursor of the now ubiquitous Lloyd's List, the oldest existing paper, the London Gazette excepted. In Lombard Street the business transacted at Lloyd's coffee-house steadily grew, but it does not appear that throughout the greater part of the 18th century the merchants and underwriters frequenting the rooms were bound together by any rules, or acted under any organization. By and by, however, the increase of marine insurance business made a change of system and improved accommodation necessary, and after finding a temporary resting-place in Pope's Head Alley, the underwriters and brokers settled in the Royal Exchange in March 1774. One of the first improvements in the mode of effecting marine insurance was the introduction of a printed form of policy. Hitherto various forms had been in use; and, to avoid numerous disputes and litigation, the Board of Lloyd's proposed a general form, which was adopted by the members on the 12th of January 1779, and remains in use, with a few slight alterations, to this day. The two most important events in the history of Lloyd's during the 19th century were the reorganization of the association in 1811, and the passing of an act in 1871 granting to Lloyd's all the rights and privileges of a corporation sanctioned by parliament. According to this act of incorporation, the three main objects for which the society exists are—first, the carrying out of the business of marine insurance; secondly, the protection of the interests of the members of the association; and thirdly, the collection, publication and diffusion of intelligence and information with respect to shipping. In the promotion of the last object Lloyd's has developed a system of service which for wideness of range and efficient working has no parallel among private enterprises. By Lloyd's Signal Station Act 1888, powers were conferred on Lloyd's to establish signal stations with telegraphic communications, and by the Derelict Vessels (Report) Act 1896, masters of British ships are required to give notice to Lloyd's agents of derelict vessels, which information is published by Lloyd's.

The rooms at Lloyd's are available only to subscribers and members. The former pay an annual subscription of five guineas without entrance fee, but have no voice in the management of the institution. The latter consist of non-underwriting members, who pay an entrance fee of twelve guineas, and of underwriting members who pay a fee of £100. Underwriting members are also required to deposit securities to the value of £5000 to £10,000, according to circumstances, as a guarantee for
engagements. The management of the establishment is delegated by the members to certain of their number selected as a "committee for managing the affairs of Lloyd's." With this body lies the appointment of all the officials and agents of the institution, the daily routine of duty being entrusted to a secretary and a large staff of clerks and other assistants. The mode employed in effecting an insurance at Lloyd's is simple. The business is done entirely by brokers, who write upon a slip of paper the name of the ship and shipmaster, the nature of the voyage, the subject to be insured, and the amount at which it is valued. If the risk is accepted, each underwriter subscribes his name and the amount he agrees to take or underwrite, the insurance being effected as soon as the total value is made up.

See F. Martin, History of Lloyd's and of Marine Insurance in Great Britain (1876).

LLWYD, EDWARD (1660-1706), British naturalist and antiquary, was born in Cardiganshire in 1660. He was educated at Jesus College, Cambridge, but did not graduate; he received the degree of M.A. however in 1701. In 1699, after serving for six years as assistant, he succeeded R. Plot as keeper of the Ashmolean Museum, a position which he retained until 1709. In 1699 he published Lithophylaccia Britannica Ichnographia, in which he described and figured various fossils, personally collected or received from his friends, and these were arranged in cabinets in the museum. They were obtained from many parts of England, but mostly from the neighbourhood of Oxford. A second edition was prepared by LLwyd, but not published until 1760. He issued in 1707 the first volume of Archaeologia Britannica (afterwards discontinued). He was elected F.R.S. in 1708. He died at Oxford on the 30th of June 1709.

LOACH. The fish known as loaches (Cobitinae) form a very distinct subfamily of the Cyprinidae, and are even regarded by some authors as constituting a family. Characters: Barbels, three to six pairs; pharyngeal teeth in one row, in moderate number; first joint of the air-ladder divided into a right and left chamber, separated by a constriction, and enclosed in a bony capsule, the posterior part free or absent. They are more or less elongate in form, often eel-shaped, and naked or covered with minute scales. Most of the species are small, the largest known measuring 12 (the European Misgurnus fossilis), 13 (the Chinese Botia variigata), or 14 inches. (the Central Asian Nemachilus siluroides). They mostly live in small streams and ponds, and many are mountain forms. They are almost entirely confined to Europe and Asia, but one species (Nemachilus abyssinus) has recently been discovered in Abyssinia. About 120 species are known, mostly from Central and South-Eastern Asia. Only two species occur in Great Britain: the common Nemachilus barbatulus and the rarer and more local Cobitis taenia. The latter extends across Europe and Asia to Japan. Many of these fishes delight in the mud at the bottom of ponds, in which they move like a blind man, the branchial respiration appears to be insufficient, and the intestinal branch of the respiratory system being long. The air-bladder may be so reduced as to lose its hydrostatic function and become subservient to a sensory organ, its outer exposed surface being connected with the skin by a meatus between the bands of muscle, and conveying the thermobarometric impressions to the auditory nerves. Loaches are known in some parts of Germany as "Wetterfisch."

LOAD; LODE. The O.E. ldd, from which both these words are derived, meant "way," "journey," "conveyance," and is cognate with Ger. Lehre. The Teutonic root is also seen in the O. Teut. ladjyn, Ger. leiten, from which comes "to lead." The meanings of the word have been influenced by a supposed connexion with "lade," O.E. hladan, a word common to many old branches of Teutonic languages in the sense of "to place," but used in English principally of the placing of cargo in a ship, hence "bail of lading," and of emptying liquor or fluid out of one vessel into another; it is from the word in this sense that is derived "lade," a large spoon or cup-like pan with a long handle. The two words, though etymologically one, have been differentiated in meaning, the influence of the connexion with "lade" being more marked in "load" than in "lode," a vein of metal ore, in which the original meaning of "way" is clearly marked. A "load" was originally a "carriage," and its Latin equivalent in the Promtiorum Porriumur is vectura. From that it passed to that which is laid on an animal or vehicle, and so, as an amount usually carried, the word was used of a specific quantity of anything, a unit of weight, varying with the locality and the commodity. A "load" of wheat=40 bushels, of hay=36 trusses. Other meanings of "load" are: in electricity, the power which an engine or dynamo has to furnish; and in engineering, the weight to be supported by a structure, the "permanent load" being the weight of the structure itself, the "external load" that of anything which may be placed upon it.

LOAF, properly the mass of bread made at one baking, hence the smaller portions into which the bread is divided for retailing. These are of uniform size (see BAKING) and are named according to shape ("tin loaf," "cottage loaf," &c.), weight ("quarter loaf," &c.) or quality of flour ("brown loaf," &c.). "Loaf," O.E. hlaf, is a word common to Teutonic languages; cf. Ger. Loib, or Leib, Dan. loev, Goth. hlafs; similar words with the same meaning are found in Russian, Finnish and Lettish, but these may have been adapted from Teutonic. The ultimate origin is unknown, and it is uncertain whether "bread" (q.v.) or "loaf" is the earlier in usage. The O.E. hlaf is seen in "Lammas" and in "lord," i.e. hlaford for hlafward, the loafkeeper, or "bread-warden"; cf. the O.E. word for a household servant hlaf-dita, loaf-eater. The Late Lat. companio, one who shares, panis, bread, Eng. "companion," was probably an adaptation of the Goth. gahlatba, O.H. Ger. giltepo, messmate, comrade. The word "loaf" is also used in sugar manufacture, and is applied to sugar shaped in a mass like a cone, a "sugar-loaf," and to the small knobs into which refined sugar is cut, or "loaf-sugar."

The etymology of the verb "to loaf," i.e. to idle, lounge about, and the "loafer," i.e. an idle, vagabond, has been much discussed. R. H. Dana (Two Years before the Mast, 1840) called the word "a newly invented Yankee word." J. R. Lowell (Biglow Papers, 2nd series, Introd.) explains it as German in origin, and says "Loaf, to loaf, and be the devil, states that the etymological form lafen is used in the sense of "scanty up and down." This explanation has been generally accepted. The New English Dictionary rejects it, however, and states that laffen is not used in this sense, but points out that the German Landläufer, the English obsolete word "loafer," and the Dutch landleper, i.e. one who wanders about the country, are from the verb lachen, landlepen, a vagrant or vagabond, has a resemblance in meaning. J. S. Farmer and W. E. Henley's Dictionary of Slang and its Analogues gives as French synonyms of "loafer," chevalier de la loupe and lumpur.

LOAM (O.E. læm; the word appears in Dut. leem and Ger. Lehm; the ultimate origin is the root lai-, meaning "to be sticky," which is seen in the cognate "limes," Lat. limus, mud, clay), a fertile soil composed of a mixture of sand, clay, and decomposed vegetable matter, the quantity of sand being sufficient to prevent the clay massing together. The word is also used of a mixture of sand, clay and straw, used for making casting-moulds and bricks, and for plastering walls, &c. (see Sott.).

LOANDA (adapted from the Scandinavian form of a word common to Teutonic tongues, cf. Swed. lån, Icel. lån, Dut. leen; the O.E. læn appears in "lend," the ultimate source is seen in the root of Gr. λένω and Lat. linquere, to leave), which is lent; a sum of money or something of value lent for a specific or indefinite period when it or its equivalent is to be repaid or returned, usually at a specified rate of interest (see USURY and MONEY-LENDING). For public loans see FINANCE, NATIONAL DEBT, and the various sections on finance under the names of the various countries.

LOANDA (Sto Paulu de Loanda), a seaport of West Africa, capital of the Portuguese province of Angola, situated in 8° 48′ S., 13° 4′ E., on a bay between the rivers Bango and Kwanza. The bay, protected from the surf by a long narrow island of sand, is backed by a low sandy cliff which at its southern end sweeps out into a sharp curve and terminates in a bold point crowned by Fort San Miguel. The depth of water at the entrance to the bay is 20 fathoms or more. The bay has silted up considerably, but
there is a good anchorage about 1½ m. from the shore in 7 to 14 fathoms, besides cranes for accommodation and a floating dock. Vessels discharge into lighters, and are rarely delayed on account of the weather. A part of the town lies on the foreshore, but the more important buildings—the government offices, the governor's residence, the palace of the bishop of Angola, and the hospital—are situated on higher ground. Most of the European houses are large stone buildings of one storey with red tile roofs. Loanda possesses a meteorological observatory, public garden, tramways, gas-works, statues to Salvador Correia de Sá, who wrested Angola from the Dutch, and to Pedro Alexandino, a former governor, and is the starting-point of the railway to Ambaca and Malanje.

Loanda was founded in 1576, and except between 1640 and 1648, when it was occupied by the Dutch, has always been in Portuguese possession. It was for over two centuries the chief centre of the slave trade between Portuguese West Africa and Brazil. During that time the traffic of the port was of so small account, and after a period of great depression consequent on the suppression of that trade, more legitimate commerce was developed. There is a regular service of steamers between the port and Lisbon, Liverpool and Hamburg. The town has some 15,000 inhabitants, including a large European population, with any滨de on the west coast of Africa connected by submarine cables with Europe and South Africa. Fully half the imports and export trade of Angola (q.e.) passes through Loanda.

LOANGO, a region on the west coast of Africa, extending from the mouth of the Congo river in 6° S. northwards through about two degrees. At one time included in the “kingdom of Congo” (see ANGOLA. HISTORY), Loango became independent about the close of the 16th century, and was still of considerable importance in the middle of the 18th century. Bualí, the capital, was situated on the banks of a small river not far from the port of Loango, where were several European “factories.” The country afterwards became divided into a large number of petty states, while Portugal and France exercised an intermittent sovereignty over the coast. Here the slave trade was longer maintained than anywhere else on the West African seaboard; since its extermination, palm oil and India-rubber have been the main objects of commerce. The Loango coast is now divided between French Congo and the Portuguese district of Kabinda (see those articles). The natives, mainly members of the Ba-Kongo group of Bantu nations, with the exception of small Bantu groups, are generally well built, strongly dolichocephalous and very thick of skull, the skin of various shades of warm brown with the faintest suggestion of purple. Baldness is unknown, and many of the men wear beards. Physical deformity is extremely rare. In religious beliefs and in the use of fetishes they resemble the negroes of Upper Guinea.

LOBACHEVKY, NICOLAS IVANOVICH (1793-1856), Russian mathematician, was born at Makariev, Nižniy-Novgorod, on the 2nd of November (N.S.) 1793. His father died about 1800, and his mother, who was left in poor circumstances, removed to Kazan with her three sons. In 1807 Nicolas, the second boy, entered as a student in the University of Kazan, then recently established. Five years later, having completed the curriculum, he began to take part in teaching, becoming assistant professor in 1814 and extraordinary professor two years afterwards. In 1825 he succeeded to the ordinary professorship of mathematics, and retained the chair until about 1846, when he seems to have fallen into official disfavour. At that time his connexion with the university to which he had devoted so much of his life was severely interrupted. He retired from it in 1855, at the celebration of his jubilee, he brought it as a last tribute his Pangeométrie, in which he summarized the results of his geometrical studies. This work was translated into German by H. Liebmann in 1902. He died at Kazan on the 24th of February (N.S.) 1856. Lobachevsky was one of the first thinkers to apply a critical treatment to the fundamental axioms of geometry, and he thus became a pioneer of the modern geometries which deal with space other than as treated by Euclid. His first contribution to non-Euclidean geometry is believed to have been given in a lecture at Kazan in 1826, but the subject is treated in many of his subsequent memoirs, among which may be mentioned the Geometrischen Untersuchungen zur Theorie der Parallelverlinien (Berlin, 1840, and a new edition in 1882), and the Pangeometrie already referred to, which in the subtitle is described as a précis of geometry founded on a general and rigorous theory of parallels. (See GEOMETRY, § Non-Euclidean, and Geometry, § Axioms of.) In addition to his geometrical studies, he made various contributions to other branches of mathematical science, among them being an elaborate treatise on algebra (Kazan, 1834). Besides being a geometer of power and originality, Lobachevskiy was an excellent man of business. Under his administration the University of Kazan prospered as it had never done before; and he not only organized the teaching staff to a high degree of efficiency, but arranged and enriched its library, furnished instruments for its observatory, collected specimens for its museums and provided it with proper buildings. In order to be able to supervise the erection of the last, he studied architecture, with such effect, it is said, that he was able to carry out the plans at a cost considerably below the original estimates.

See F. Engel, N. Lobatchevsky (Leipzig, 1899).

LOBANOV-ROSTOVSKI, ALEXIS BORISOVICH was born on the 30th of December 1824, and educated, like Prince Gorchakov and so many other eminent Russians, at the lycee of Tsarskoe Selo. At the age of twenty he entered the diplomatic service, and became minister at Constantinople in 1859. In 1863 a regrettable incident in his private life made him retire temporarily from the public service, but four years later he re-entered it and served for ten years as adlatus to the minister of the interior. At the close of the Russo-Turkish war in 1878 he was selected by the emperor to fill the post of ambassador at Constantinople, and for more than a year he carried out with great ability the policy of his government, which aimed at re-establishing tranquillity in the Eastern Question, after the disturbances produced by the reckless action of his predecessor, Count Ignatiev. In 1879 he was transferred to London, and in 1882 to Vienna; and in March 1895 he was appointed minister of foreign affairs in succession to M. de Giers. In this position he displayed much of the caution of his predecessor, but adopted a more energetic policy in European affairs generally and especially with regard to the Balkan Peninsula. At the time of his appointment the attitude of the Russian government towards the Slav nationalities had been for several years one of extreme reserve, and he had seemed as ambassador to sympathize with this attitude. But as soon as he became minister of foreign affairs, Russian influence in the Balkan Peninsula suddenly revived. Servia received financial assistance; a large consignment of arms was sent openly from St Petersburg to the prince of Montenegro; Prince Ferdinand of Bulgaria became ostensively reconciled with the Russian emperor, and his son Boris was received into the Eastern Orthodox Church; the Russian embassy at Constantinople tried to bring about a reconciliation between the Bulgarian exarch and the eccumenical patriarch; Bulgarians and Servians professed, at the bidding of Russia, to lay aside their mutual hostility. All this seemed to foreshadow the creation of a Balkan confederate hostile to Turkey, and the sultan had reason to feel alarmed. In reality Prince Lobanov was merely trying to establish a strong Russian hegemony among these nationalities, and he had not the slightest intention of provoking a new crisis in the Eastern Question so long as the general policy of the Russo-Turkish war did not afford Russia a convenient opportunity for solving her own interest with the serious intervention of other powers. Meanwhile he considered that the integrity and independence of the Ottoman empire must be maintained so far as these other powers were concerned. Accordingly, when Lord Salisbury proposed energetic action to protect the Armenians, the cabinet of St Petersburg suddenly assumed the rôle of protector of the sultan and vetoed the proposal. At the same time efforts were made to weaken the Triple Alliance, the principal instrument employed being the
with France, which Prince Lobanov helped to convert into a formal alliance between the two powers. In the Far East he was not less active, and became the protector of China in the same sense as he had shown himself the protector of Turkey. Japan was compelled to give up her conquests on the Chinese mainland, so as not to interfere with the future action of Russia in Manchuria, and the financial and other schemes for increasing Russian influence in that part of the world were vigorously supported. All this activity, though combined with a haughty tone towards foreign governments and diplomats, did not produce much general apprehension, probably because there was a widespread conviction that he desired to maintain peace, and that his great ability and strength of character would enable him to control the dangerous forces which he boldly set in motion. However this may be, before he had time to mature his schemes, and when he had been the director of Russian policy for only eighteen months, he died suddenly of heart disease when travelling with the emperor on the 20th of August 1806. Personally Prince Lobanov was a grand seigneur of the Russian type, proud of being descended from the independent princes of Rostov, and at the same time an amiable man of wide culture, deeply versed in Russian history and genealogy, and perhaps the first authority of his time in all that related to the reign of the emperor Paul. (D. M. W.)

LÖBAU, a town of Germany, in the kingdom of Saxony, on the Löbauer water, 12 m. S.E. of the town of Bautzen, on the Dresden-Görlitz railway. Pop. (1895) 10,683. There is a spa, König Albert-Bad, largely frequented during the summer season. The town has agricultural implement, pianoforte, sugar, machine-building and button works, and trade in grain, yarn, linen and stockings. Other industries are spinning, weaving, dyeing, bleaching and brewing.

Lobau is first mentioned as a town in 1211; it received civic rights early in the 14th century and, in 1346, became one of the six allied towns. It was partially occupied during the Hussite war and was deprived of its rights in 1547.

See Bergmann, Geschichte der Oberlausitzer Seckstädt Lôbou (Bischosferda, 1896); and Kretschmer, Die Stadt Löbau (Chemnitz, 1894).

LOBBY, a corridor or passage, also any apartment serving as an ante-room, waiting room or entrance hall in a building. The Med. Lat. lobia, labia or lobium, from which the word was directly adopted, was used in the sense of a cloister, gallery or covered place for walking attached to a house, as defined by Du Cange (Gloss. Med. et Inf. Lat., s.v. Lobia. porticus operta ad spatium dionea, aedibus adjuncta). The French form of lobia was loge, cf. Ital. loggia, and this gave the Eng. "lobby," which is thus a doublet of "lobby." The ultimate derivation is given under LODGE. Other familiar uses of the term "lobby" are its application (1) to the entrance hall of a parliament house, and (2) to the two corridors known as "division-lobbies," into which the members of the House of Commons and other legislative bodies pass on a division, their votes being recorded according to which "lobby," "aye" or "no," they enter. The entrance lobby to a legislative building is open to the public, and thus is a convenient place for interviews between members and their constituents or with representatives of public bodies, associations and interests, and the press. The influence and pressure thus brought to bear upon members of legislative bodies has given rise to the use of "to lobby," "lobbying," "lobbyist," &c., with this special significance. The practice, though not unknown in the British parliament, is most prevalent in the United States of America, where the use of the term first arose (see below).

LOBBYING, in America, a general term used to designate the efforts of persons who are not members of a legislative body to influence the course of legislation. In addition to the large number of American private bills which are constantly being introduced in Congress and the various state legislatures, there are many general measures, such as proposed changes in the tariff or in the railway or banking laws, which seriously affect special interests. The people who are most intimately concerned naturally have a right to appear before the legislature or its representa-

sentative, the committee in charge of the bill, and present their side of the case. Lobbying in this sense is legitimate, and may almost be regarded as a necessity. Unfortunately, however, all lobbying is not of this innocent character. The great industrial corporations, insurance companies, and railway and traction monopolies which have developed in comparatively recent years are constantly in need of legislative favours; they are also compelled to protect themselves against legislation which is unreasonably severe, and against what are known in the slang of politics as strikes or hold-ups.1 In order that these objects may be accomplished there are kept at Washington and at the various state capitals paid agents whose influence is so well recognized that they are popularly called "the third house." Methods of the most reprehensible kind have often been employed by them.

Attempts have been made to remedy the evil by constitutional prohibition, by statute law and by the action of the governor of the state supported by public opinion. Improper lobbying has also declined a felony in California, Georgia, Utah, Tennessee, Oregon, Montana and Arizona, and the constitutions of practically all the states impose restrictions upon the enactment of special and private legislation. The Massachusetts anti-lobbying act of 1890, which has served as a model for the legislation of Maryland (1900), Wisconsin (1905) and a few of the other states, is based upon the publicity principle. Counsel and other legislative agents must register with the sergeant-at-arms giving the names and addresses of their employers and the date, term and character of their employment. In 1907 alone laws regulating lobbying were passed in nine states—Alabama, Connecticut, Florida, Idaho, Missouri, Nebraska, North Dakota, South Dakota and Texas.

LOBE, any round projecting part, specifically the lower part of the external ear, one of the parts into which the liver is divided, also one of several parts of the brain, divided by marked fissures (see LIVER and BRAIN). The Greek λόβος, from which "lobe" is derived, was applied to the lobe of the ear and of the liver, and to the pod of a leguminous plant.

LOBECK, CHRISTIAN AUGUST (1781–1860), German classical scholar, was born at Naumburg on the 5th of June 1781. After having studied at Jena and Leipzig, he settled at Wittenberg in 1802 as privat-docent, and in 1810 was appointed to a professorship in the university. Four years later, he accepted the chair of rhetoric and ancient literature at Königsberg, which he occupied till within two years of his death (25th of August 1860). His literary activities were devoted to the history of Greek religion and to the Greek language and literature. His greatest work, Aglaophamus (1829), is still valuable to students. In this he maintains, against the views put forward by G. F. Creuzer in his Symbolik (1810–1823), that the religion of the Greek mysteries (especially those of Eleusis) did not essentially differ from the national religion which it was not esoteric; that the priests as such neither taught nor possessed any higher knowledge of God; that the Oriental elements were a later importation. His edition of the Ajax of Sophocles (1809) had gained him the reputation of a sound scholar and critic; his Phrynichus (1830) and Paralipomena grammaticae graecae (1837) exhibit the widest acquaintance with Greek literature. He had little sympathy with comparative philology, holding that it needed a lifetime to acquire a thorough knowledge of a single language.

See the article by L. Friedländer in Allgemeine deutsche Biographie: C. v. F. Creuzer, Geschichte der philosophischen Betrachtungen in Deutschland (1838); Lehrr, Populäre Aufsätze aus dem Altertum (2nd ed., Leipzig, 1875); Ludwig, Ausgewählte Briefe von und an Chr. Aug. Lobeck und K. Lehrr (1894); also J. E. Sandys, History of Classical Scholarship, i. (1906), 193.

1 Bills introduced for purposes of blackmail.
LOBEIRA—LOBO, F. R.

LOBEIRA, JOÃO (c. 1323–1383), a Portuguese troubadour of the time of King Alphonse III., who is supposed to have been the first to reduce into prose the Adonis of Gaul (q.v.). D. Canovas de Vasconcellos, in her masterly edition of the Canzoniere d’Auida (Halle, 1904, vol. i. pp. 523–524), gives some biographical notes on João Lobeira, who is represented in the Colocci Brancuti Canzoniere (Halle, 1880) by five poems (Nos. 230–235). In number 230, João Lobeira uses the same ritornelle that Orlana sings in Adonis of Gaul, and this has led to his being generally considered by modern supporters of the Portuguese case to have been the author of the romance, in preference to Vasco de Lobeira, to whom the prose original was formerly ascribed. The folklorist A. Thomas Pires (in his Vasco de Lobeira, Elvas, 1905), following the old tradition, would identify the novelist with a man of that name who flourished in Elvas at the close of the 14th and beginning of the 15th century, but the documents he publishes contain no reference to this Lobeira being a man of letters.

LOBELIA, the typical genus of the tribe Lobelieae, of the order Campanulales, named after Matthias de Lobel, a native of Lille, botanist and physician to James I. It numbers about two hundred species, natives of nearly all the temperate and warmer regions of the world, excepting central and eastern Europe as well as western Asia. They are annual or perennial herbs or shrubs, rarely shrubby; remarkable arborescent forms are the tree-lobelias found at high elevations on the mountains of tropical Africa. Two species are British, L. Dortmanniana (named by Linnæus after Dortmann, a Dutch druggist), which occurs in gravelly mountain lakes; and L. unica, which is only found on heaths, &c., in Dorset and Cornwall. The genus is distinguished from Campanula by the irregular corolla and completely united anthers, and by the excessive acidity of the milky juice. The species earliest described and figured appears to be L. cardiiflora, under the name Franchetium americanum sive cardinale planta, “the rich crimson cardinal’s flower”; Parkinson (Paradisi, 1629, p. 357) says, “It growth neere the river of Canada, where the French plantation in America is seated.” It is a native of the eastern United States. This and several other species are in cultivation as ornamental garden plants, e.g. the dwarf blue L. Erinus, from the Cape, which, with its numerous varieties, forms a familiar bedding plant. L. splendens and L. fulgens, growing from 1 to 2 ft. high, from Mexico, have scarlet flowers; L. Tupe, a Chilean perennial 6 to 8 ft. high, has scarlet or scarlet flowers; L. tenue, with blue flowers is a recent introduction to the greenhouse section, while L. amaena, from North America, as well as L. syphilitica and its hybrids, from Virginia, have also blue flowers. The last-named was introduced in 1665. The hybrids raised by crossing cardinale, fulgens, splendens and syphilitica, constitute a fine group of fairly hardy and showy garden plants. Queen Victoria is a well-known variety, but there are now many others.

The Lobelia is familiar in gardens under two very different forms, that of the dwarf-tufted plants used for summer bedding, and that of the tall showy perennials. Of the former the best type is L. Erinus, growing from 4 to 6 in. high, with many slender stems, bearing bright blue and scarlet rosette-like flowers round the base of the old flowering stem, and these sometimes, despite all the care taken of them, rot off during the winter. The roots should either be taken up in autumn, and planted closely side by side in borders, or in the case of long-tubed flowers, be dug up in time, they are dormant either in a cold frame or in any airy place in the garden; or they may be left in the ground, in which case a brick or two should be put beside the plants, some coal ashes being first placed round them, and slates to protect the plants being laid over the bricks, one end resting on the earth beyond. About February they should be placed in a warm pit, and after a few days shaken out and the suckers parted, and potted singly into small pots of light rich earth. After being kept in the forcing pit until well established, they should be moved to a more airy greenhouse pit, and eventually to a cold frame preparatory to planting out. In the more favoured parts of the United Kingdom it is unnecessary to go to this trouble, as the plants are perfectly hardy; even in the suburbs of London they live for several years without protection except in very severe winters.

L. cornwalliana, the dwarf-tufted form, does exactly the same, and require copious waterings when they start into free growth. They may be raised from seeds, which, being very fine, require to be sown carefully; but they do not flower usually till the second year unless the seed is sown early in the year.

The species Lobelia inflata, the “Indian tobacco” of North America, is used in medicine, the entire herb, dried and in flower, being employed. The species derives its specific name from its characteristic inflated capsules. It is somewhat irritant to the oral mucous membrane, and is antiseptic, and forms a powerful stimulant and is antispasmodic. The chief constituent is a volatile liquid alkaloid (cf. nicotine) named lobeline, which occurs to the extent of about 30%. This is a very pungent body, with a tobacco-like odour. It occurs in combination with other alkaloids, and forms some crystalline salts. The simple preparation of this plant in the British Pharmacopeia is the Tincture Lobelieae Etheriae, composed of five parts of spirits of ether to one of lobelia. The dose is 5 to 15 minims. The ether is employed in order to enhance the efficacy of the drug in asthma, but a simple alcoholic tincture would be really preferable.

Lobelia has certain pharmacological resemblances to tobacco. It has no action upon the unbroken skin, but may be absorbed by it under suitable conditions. Taken internally in small doses, e.g. 5 minims of the tincture, it stimulates the peristaltic movements of the cecum and colon. In large doses it is a powerful gastro-intestinal irritant, closely resembling tobacco, and causing giddiness, nausea, vomiting, and diarrhoea; with it, or with tobacco, the clammy sweats and faltering rapid pulse. Its action on the circulation is decided. The cardiac terminals of the vagus nerves are paralysed, the pulse being thus accelerated by loss of the normal inhibitory influence. Hence the excessive increase of the heart during the excitement of the vasomotor centre. The blood-pressure thus falls very markedly. The respiratory centre is similarly depressed, death ensuing from this action. Lobelia is thus a typical respiratory poison. In this connection it is to be remembered that the vagal terminals of the vagi in the bronchi and bronchioles are paralysed, thus causing relaxation of the bronchial muscles. It is doubtful whether lobelia affects the cerebrum directly. It is excreted by the kidneys and the skin, both of which excretions stimulate the gastric mucosa generally, and may be said to stimulate non-specific muscular fibres in small, and paralyse them in toxic doses.

Five minims of the tincture may be usefully prescribed to be taken night and morning in chronic constipation due to inertia of the lower part of the alimentary canal. In spasmodic (neurotic) asthma, and also in bronchitis accompanied by asthmatic spasm of the bronchioles, the tincture may be given in comparatively large doses (e.g. one dram) every fifteen minutes until nausea is produced, or the patient is unsatiable, and then the administration of the drug must be stopped.

LOBENSTEIN, a town of Germany, in the principality of Reuss, on the Lemnitz, situated in a pleasant and fertile country, 25 m. N.W. from Hof by railway. Pop. (1905) 2900. The town, grouped round a rock, upon which stand the ruins of the old castle, is exceedingly picturesque. It contains a spacious parish church, a palace, until 1824 the residence of the princes of Reuss-Lobenstein-Elersdorf, and a hydropathic establishment. The manufactures include dyeing, brewing and curing-making.

LOBET, Friedrich Schott, Führer durch Lobenstein und Umgebung (2nd ed., Lobenstein, 1903).

LOBO, FRANCISCO RODRIGUES (1755–1767), Portuguese bucicover writer, a lineal descendant in the family of letters of Bernardim Ribeiro and Christovam Falcão. All we know of his life is that he was born of rich and noble parents at Leiria, and lived at ease in its picturesque neighbourhood, reading philosophy and poetry and writing of shepherds and shepherdesses by the rivers Liz and Lena. He studied at the university of Coimbra and took the degree of licentiate about 1600. He visited Lisbon from time to time, and tradition has it that he died by drowning on his way thither as he was descending the Tagus from Santarem. Though his first book, a little volume of verses (Romanos) published in 1596, and his last, a hymn, welcomed to King Philip III., published in 1623, are written in Spanish, he composed his elegies and prose pastoral Lynn in Portugal, and thereby did a rare service to his country at a time when, owing to the Spanish domination, Castilian was the language preferred by polite society and by men of letters.

His Primo Vera, a book that may be compared to the Diana de Jorge de Montemor (Montemayor), appeared in 1601, its second part, the Pastor Peregrino, in 1608, and its third, the Desenganado,
LOBO, J.—LOCAL GOVERNMENT

in 1614. The dullness of these lengthy collections of episodes without plan, thread or ideas, is relieved by charming and ingenious pastoral songs named serranilhas. His eclogues in endecasyllables are an echo of those of Camoens, but like his other verses they are inferior to his redondilhas, which show the traditional fount of his inspiration. In his Corte na Aldeia (1610), a man of letters, a young nobleman, a student and an old man of easy means, beguile the winter evenings at Cintra by a series of philosophic and literary discussions in dialogue which may still be read with pleasure. Lobo is also the author of an insipid epic in twenty cantos in ottava rima on the Constable D. Nuno Alvares Pereira, the hero of the war of independence against Spain at the end of the 14th century. The characteristics of his prose style are harmony, purity and elegance, and he ranks as one of Portugal’s leading writers. A disciple of the Italian school, his verses are yet free from imitations of classical models, his descriptions of natural scenery are unsurpassed in the Portuguese language, and generally his writings strike a true note and show a sincerity that was rare at the time. Their popularity may be seen by the fact that the Prima vera went through seven editions in the 17th century and nine in all, a large number for so limited a market as that of Portugal, while six editions exist of the Pastor Peregrino and four of the epic poem. An edition of his collected works was published in one volume in Lisbon in 1723, and another in four volumes, but less complete, appeared there in 1774.

See Costa e Silva, Ensaio biográfico critico, v. 5:112, for a critical examination of Lobo’s writings; also Bouterwek’s History of Portuguese Literature, E. Pk.)

LOBO, JERONIMO (1503–1678), Jesuit missionary, was born in Lisbon, and entered the Order of Jesus at the age of sixteen. In 1621 he was ordered as a missionary to India, and in 1622 he arrived at Goa. With the intention of proceeding to Abyssinia, whose Negus (emperor) Segued had been converted to Roman Catholicism by Pedro Paes, he left India in 1624. He disembarked on the coast of Mombasa, and attempted to reach his destination through the Galla country, but was forced to return. In 1625 he set out again, accompanied by Mendez, the patriarch of Ethiopia, and eight missionaries. The party landed on the coast of the Red Sea, and Lobo settled in Abyssinia as superintendent of the missions in Tigré. He remained there until death deprived the Catholics of their protector, the emperor Segued. Forced by persecution to leave the kingdom, in 1634 Lobo embarked at Massawa, and was imprisoned in the hands of the Turks at Massawa, who sent him to India to prepare a ransom for his imprisoned fellow-missionaries. In this he was successful, but could not induce the Portuguese viceroy to send an armament against Abyssinia. Intent upon accomplishing this cherished project, he embarked for Portugal, and after he had been shipwrecked on the coast of Natal, and captured by pirates, arrived at Lisbon. Neither at this city, however, nor at Madrid and Rome, was any countenance given to Lobo’s plan. He accordingly returned to India in 1640, and was elected rector, and afterwards provincial, of the Jesuits at Goa. After some years he returned to his native city, and died there on the 29th of January 1678.

Lobo wrote an account of his travels in Portuguese, which appears never to have been published, but is deposited in the monastery of St. Roque, Lisbon. Balthazar Telles made large use of the information therein in his Historia geral da Ethiopia a Alta (Coimbra, 1660), often erroneously attributed to Lobo (see Machado’s Bibliotheca Lusitana). Lobo’s own narrative was translated from a MS. copy into French in 1729 by the Abbé Joachim le Grand, under the title of Voyagehistorique d’Abyssinie. In 1669 a translation by Sir Peter Wyche of several passages from a MS. account of Lobo’s travels was published by the Royal Society (translated in M. Thévenot’s Relation des Voyages in 1673). An English abridgment of Le Grand’s edition by Dr Johnson was published in 1735 (reprinted 1780). In a Mémoire justificatif en réponse à des pamphlets contre Lobo, Dr. Pierre Delaunay maintains against Bruce the accuracy of Lobo’s statements as to the source of the Abai branch of the Nile. See A. de Backer, Bibliothèque de la Compagnie de Jésus (ed. C. Sommervogel, iv., 1893).

LOBSTER (O.E. lopstyr, lopstyr, a corruption of Lat. locusta, lobster or other marine shell-fish; also a locust), an edible crustacean found on the coasts of the North Atlantic and Mediterranean. The name is sometimes loosely applied to any of the larger Crustacea of the order Macrura, especially to such as are used for food.

The true lobsters, forming the family Homaridae, are distinguished from the other Macrura by having the first three pairs of legs terminating in chelae or pincers. The first pair are large and massive and are composed of six segments, while the remaining legs are each composed of seven segments. The sternum of the last thoracic somite is immovably united with the preceding. This last character, together with some peculiarities of the branchial system, distinguish the lobsters from the freshwater crayfishes. The common lobster (Homarus gammarus or vulgaris) is found on the European coasts from Norway to the Mediterranean. The American lobster (Homarus americanus), which should perhaps be ranked as a variety rather than as a distinct species, is found on the Atlantic coast of North America from Labrador to Cape Hatteras. A third species, found at the Cape of Good Hope, is of small size and of no economic importance.

Both in Europe and in America the lobster is the object of an important fishery. It lives in shallow water, in rocky places, and is usually captured in traps known as lobster-pots, or creels, made of wickerwork or of hoops covered with netting, and having funnel-shaped openings permitting entrance but preventing escape. These traps are baited with pieces of fish, preferably stale, and are sunk on ground frequented by lobsters, the place of each being marked by a buoy. In Europe the lobsters are generally sent to market in the fresh state, but in America, especially in the northern New England states and in the maritime provinces of Canada, the canning of lobsters is an important industry. The European lobster rarely reaches the American coast, though individuals of 14 pounds have been found, and in America there are authentic records of lobsters weighing 20 to 23 pounds.

The effects of over-fishing have become apparent, especially in America, rather in the reduced average size of the lobsters caught than in any diminution of the total yield. The imposition of a close time to protect the spawning lobsters has been often tried, but as the female carries the spawn attached to her body for nearly twelve months after spawning it is impossible to give any effective protection by this means. The prohibition of the capture of females carrying spawn, or, as it is termed, “in berry,” is difficult to enforce. A minimum size, below which it is illegal to sell lobsters, is fixed by law in most lobster-fishing districts, but the value of the protection so given has also been questioned.

The Norwegian lobster (Nephrops norvegicus) is found, like the common lobster, from Norway to the Mediterranean. It is a smaller species, with long and slender claws and is of an orange colour, often beautifully marked with red and blue. It is found in deeper water and is generally captured by trawling. It is a curious and unexplained fact that nearly all the individuals so captured are males. It is less esteemed for food than the common species. In London it is sold under the name of “Dublin prawn.”

The rock lobster, spiny lobster, or sea-crawfish (Palinurus vulgaris) belongs to the family Palinuridae, distinguished from the Homaridae by the fact that the first legs are not provided with chelae or pincers, and that all the legs possess only six segments. The antennae are very long and thick. It is found on the southern and western coasts of the British Islands and extends to the Mediterranean. It is highly esteemed for the table, especially in France, where it goes by the name of Langouste. Other species of the same family are used for food in various parts of the world, especially on the Pacific coast of North America and in Australia and New Zealand.

In Melbourne and Sydney the name of “Murray lobster” is given to a large species of crayfish (Astacopsis spinifer, formerly known as Astacus, or Potamobius serratus) which is much used for food.

(W. T. C.)

LOCAL GOVERNMENT, a phrase specially adopted in English usage for the decentralized or deconcentrated administration, within a state or national and central government, of local affairs by local authorities. It is restricted not only in respect
of area but also in respect of the character and extent of the duties assigned to them. It is not to be confused with local self-government in the wider sense in which the words are sometimes employed, e.g. for the granting by the crown of self-government to a colony; the expression, in a general way, may mean this, but "local government" as technically used in England refers more narrowly to the system of county or municipal administration, and English usage transfers it to denote the similar institutions in other countries. The growth and persistence of this kind of subordinate government is due practically to the need of relieving the central authority in the state, and to experience of the failure of a completely centralized bureaucracy. The degree to which local government is adopted varies considerably in different countries, and those which are the best examples of it in modern times—the United Kingdom, the United States, France and Germany—differ very much in their local institutions, partly through the greater part through the greater temperamental causes. A certain shifting of ideas from time to time, as to what is local and what is central, is inevitable, and the same view is not possible in countries of different configuration, history or political system. The history and present state of the local government in the various countries are dealt with in the separate articles on them (England, Germany, &c.), in the sections dealing with government and administration, or political institutions. The best recent comparative study of local government is Percy Ashley's Local and Central Government (Murray, 1906), an admirable account of the origin, development and working of the systems in England, France, Prussia and United States. Other important works, in addition to general works on constitutional law, are J. A. Fairlie's Municipal Administration, State's Municipal Government in Continents (Macmillan, 1896), the admirable historical inquiry into English local government (1906), and for Germany, Bohnak's Geschichte des preussischen Verwaltungsraths (1854), and S. B. Birckner's Geschichte der deutschen Staatsverwaltung (Müller, 1879). The Local Government Board, a department of the administration of the United Kingdom, constituted in 1871. It is the successor of the General Board of Health, established in 1848 pursuant to the Public Health Act of that year. The General Board of Health continued in existence until 1854, when it was reconstituted. Its existence under its new constitution was originally limited to one year, but was extended from year to year until 1838, when it was allowed to expire, its powers under the various acts for the prevention of diseases being transferred to the privy council, while those which related to the control of local authorities passed to the secretary of state for the home department, to whose department the staff of officials and clerks belonging to the board was transferred. This state of affairs continued until 1871, when the Local Government Board was created by the Local Government Board Act 1871. It consists of the lord president of the council, the five principal secretaries of state, the lord privy seal, the chancellor of the exchequer, and a president appointed by the sovereign. The board itself seldom meets, and the duties of the department are discharged by the president assisted by a parliamentary and a permanent secretary and a permanent staff. The president and one of the secretaries usually have seats in parliament, and the president is generally a member of the cabinet. The salary of the president, formerly £7,000, was raised in 1910 to £10,000 a year. The board has all the powers of the secretary of state under the Public Health Act 1848, and the numerous subsequent acts relating to sanitary matters and the government of sanitary districts; together with all the powers and duties of the privy council under the acts relating to the prevention of epidemic disease and to vaccination. The powers and duties of the board have been largely added to by legislation since its creation; it may be said that the board exercises a general supervision over the numerous authorities to whom local government has been entrusted (see England: Local Government). A committee presided over by Lord Jersey in 1904 inquired into the constitution and duties of the board, but made no recommendation as to any change therein. It recommended, however, an increase in the salaries of the president and of the parliamentary and permanent secretaries.

LOCARNO (Ger. Lugano), a small town of Italian appearance in the Swiss canton of Tessin or Ticino, of which till 1881 it was one of the three capitals (the others being Bellinzona, q.v., and Lugano, q.v.). It is built at the north or Swiss end of the Lago Maggiore, not far from the point at which the Maggia enters that lake, and is by rail 14 m. S.W. of Bellinzona. Its height above the sea-level is only 682 ft., so that it is said to be the lowest spot in Switzerland. In 1900 its population was 3603, mainly Italian-speaking and Romanists. It was taken from the Milanese in 1512 by the Swiss who ruled it till 1798, when it became part of the canton of Lugano in the Helvetic Republic, and in 183 part of that of Tessin or Ticino, then first erected. In 1555 a number of Protestant inhabitants were expelled for religious reasons, and going to Zurich founded the silk industry there. Above Locarno is the romantically situated sanctuary of the Madonna del Sasso (now rendered easily accessible by a funicular railway) that commands a glorious view over the lake and the surrounding country. (W. A. B. C.)

LOCH, HENRY BROUGHAM LOCH, 1st Baron (1837–1900), British colonial administrator, son of James Loch, M.P., of Drylaw, Midlothian, was born on the 23rd of May 1827. He entered the navy, but at the end of two years quitted it for the East India Company's military service, and in 1842 obtained a commission in the Bengal Light Cavalry. In the Sikh war in 1845 he was given an appointment on the staff of Sir Hugh Gough, and served throughout the Sutlej campaign. In 1852 he became second in command of Skinner's Horse. At the outbreak of the Crimean war in 1854, Loch severed his connexion with India, and obtained leave to raise a body of irregular Bulgarian cavalry, which he commanded throughout the war. In 1857 he was appointed attaché to Lord Elgin's mission to the East, was present at the taking of Canton, and in 1858 brought home the treaty of Yedo. In April 1860 he again accompanied Lord Elgin to China, as secretary of the new embassy sent to secure the execution by China of her treaty engagements. The embassy was backed up by an allied Anglo-French force. With Harry S. Parkes he negotiated the surrender of the Taku forts. During the advance on Peking Loch was chosen with Parkes to complete the preliminary negotiations for peace at Tungchow. They were accompanied by a small party of officers and Sikhs. It having been discovered that the Chinese were planning a treacherous attack on the British force, Loch rode back and warned the outposts. He then returned to Parkes and his party under a flag of truce hoping to secure their safety. They were all, however, made prisoners and taken to Peking, where the majority died from torture or disease. Parkes and Loch, after enquiring into the trial and the horrors of a Chinese prison, were afterwards more leniently treated. After three weeks' time the negotiations for their release were successful, but they had only been liberated ten minutes when orders were received from the Chinese emperor, then a fugitive from China, for their immediate execution. Loch never entirely recovered his health after this experience in a Chinese dungeon. Returning home he was made C.B., and for a while was private secretary to Sir George Grey, then at the Home Office. In 1863 he was appointed lieutenant-governor of the Isle of Man. During his governorship the House of Keys was transformed into an elective assembly, the first line of railway was opened, and the influx of tourists began to bring fresh prosperity to the island. In 1882 Loch, who had become K.C.B. in 1880, accepted a commissionership of woods and forests, and two years later was made governor of Victoria, where he won the esteem of all classes. In June 1889 he succeeded Sir Hercules Robinson as governor of Cape Colony and high commissioner of South Africa. As high commissioner his duties called for the exercise of great judgment and firmness. The Boers were at the same time striving to frustrate Cecil Rhodes's schemes of northern expansion and planning to occupy Mashonaland, to secure control of Swaziland and Zululand and to acquire the adjacent lands up to the ocean. Loch firmly supported Rhodes, and, by informing President Kruger that troops would be sent to prevent any invasion of territory under British protection, he effectively
crushed the "Banyailand trek" across the Limpopo (1890-91). Loch, however, with the approval of the imperial government, concluded in July-August 1890 a convention with President Kruger respecting Swaziland, by which, while the Boers withdrew all claims north of the Transvaal, they were granted an outlet to the sea at Kosi Bay on condition that the republic entered the South African Customs Union. This convention was concluded after negotiations conducted with President Kruger by J. H. Holmey on behalf of the high commissioner, and was made at a time when the British and Bond parties in Cape Colony were working in harmony. The Transvaal did not, however, fulfill the necessary condition, and in view of the increasingly hostile attitude of the Pretoria administration to Great Britain, Loch became a strong advocate of the annexation by Britain of the territory east of Swaziland, through which the Boer railway to the sea would have passed. He at length induced the British government to adopt this view and on the 15th of March 1895 it was announced that these territories (Amatongaland, &c.), would be annexed by Britain, an announcement received by Mr Kruger with "the greatest astonishment and regret." Meantime Loch had been forced to intervene in another matter. When the commanding difficulty of 1894 had roused the Uitlanders in the Transvaal to a dangerous pitch of excitement, he travelled to Pretoria to use his personal influence with President Kruger, and obtained the withdrawal of the obnoxious commanding regulations. In the following year he entered a strong protest against the new Transvaal franchise law. Meanwhile, however, the general situation in South Africa was assuming year by year a more threatening aspect. Cecil Rhodes, then prime minister of Cape Colony, was strongly in favour of a more energetic policy than was supported by the Imperial government, and at the end of March 1895 the high commissioner, finding himself, it is believed, out of touch with his ministers, returned home a few months before the expiry of his term of office. In the same year he was raised to the peerage. When the Anglo-Boer war broke out in 1899, Loch took a leading part in raising and equipping a body of mounted men named after him "Loch's Horse." He died in London on the 20th of June 1900, and was succeeded as 2nd baron by his son Edward (b. 1873).

Lochaber, a district of southern Inverness-shire, Scotland, bounded W. by Loch Linne, the river and loch Lochy, N. by the Corryvark range and adjoining hills, N.E. and E. by the district of Badenoch, S.E. by the district of Knooch and S. by the river and loch Leven. It measures 32 m. from N.E. to S.W. and 25 m. from E. to W., and is remarkable for wild and romantic scenery, Ben Nevis being the chief mountain. The district has given its name to a celebrated type of axe, consisting of a long shaft with a blade like a scythe and a large hook behind it, which, according to Sir Walter Scott, was introduced into the Highlands and Ireland from Scandinavia. It was the weapon of the old City Guard of Edinburgh. The pathetic song of "Lochaber no more" was written by Sir James Macpherson.

Loches, a town in France, capital of an arrondissement in the department of Indre-et-Loire, 29 m. S.E. of Tours by rail, on the left bank of the Indre. Pop. (1906) 7351. The town, one of the most picturesque in central France, lies at the foot of the rocky eminence on which stands the castle of the Anjou family, surrounded by an outer wall 14 m. in circumference, and consisting of the old collegiate church of St Ours, the royal lodge and the donjon. The church of St Ours dates from the 10th to the 12th centuries; among its distinguishing features are the huge stone pyramids surmounting the nave and the beautiful carving of the west door. The royal lodge, built by Charles VII. and used as the subprefecture, contains the tomb of Agnes Sorel and the oratory of Anne of Brittany. The donjon includes, besides the ruined keep (12th century), the Martele, celebrated as the prison of Lodovico Sforza, duke of Milan, who died there in 1508, and the Tour Ronde, built by Louis XI. and containing the famous iron cages in which state prisoners, including—according to a story now discredited—the inventor Cardinal Balue, were confined. Loches has an hotel-de-ville and several houses of the Renaissance period. It has a tribunal of first instance, a communal college and a training college. Liqueur-distilling and tanning are carried on together with trade in farm-produce, wine, wood and live-stock.

On the right bank of the Loire, opposite the town and practically its suburb, is the village of Beaulieu-les-Loches, once the seat of a barony. Besides the parish ch rch of St Laurence, a beautiful specimen of 13th-century architecture, it contains the remains of the great abbey church of the Holy Sepulchre founded in the 11th century by Fulk Nerra, count of Anjou, who is buried in the chancel. This church, which with one of the older transepts now constitutes the church, dates from the 15th century. The Romanesque nave is in ruins, but of the two towers one survives intact; it is square, crowned with an octagonal steeple of stone, and is one of the finest extant monuments of Romanesque architecture.

Loches (the Roman Lenea) grew up round a monastery founded about 500 by St Ours and belonged to the counts of Anjou from 1086 till 1395. In the latter year it was seized from King John of England by Philip Augustus, and from the middle of the 13th century till after the time of Charles IX. the castle was a residence of the kings of France.

Lochelly, a police burgh of Fifeshire, Scotland, 7½ m. N.E. of Dunfermline by the North British railway. Pop. (1901) 5472. The town is modern and owes its prosperity to the ironworks and collieries in its immediate vicinity. Lochelly, from which the town takes its name, situated ½ m. S. E., measures ½ m. in length by ¾ m. in breadth, contains some trout and pike, and has on its west banks Lochgelly House, a seat of the earl of Minto. The Romans are said to have had a station at Loch Ore in the parish of Ballingry, 2½ m. N. W., which was drained about the end of the 18th century and then cultivated. To the N.E. rises the hill of Benarty (131 ft.). Halyards, about 2 m. S.E. of Lochgelly, is a ruined house that once belonged to Sir William Kirkaldy of Grange, who held Edinburgh Castle for Queen Mary. Here James V. was received after his defeat at Solway Moss in 1542, and here a few Jacobites used to meet in 1715.

Lochgilphead, a municipal and police burgh of Argyllshire, Scotland, at the head of Loch Gilp, a small arm on the western side of Loch Fyne. Pop. (1901) 1313. The herring-fishery is the chief industry, but there is some weaving of woollens and, in summer, a considerable influx of visitors. Airdsfaig (pop. 1285), a seaport on the west of the mouth of Loch Gilp, is the east terminus of the Crinan Canal. It is the place of transhipment from the large Glasgow passenger steamers to the small craft built for the navigation of the canal. It is an important harbour in connexion with the Loch Fyne herring-fishery, and there is also a distillery. During the summer there is a coach service to Ford at the lower end of Loch Awe.

Lochmaben, a royal and police burgh of Dumfriesshire, Scotland, 8 m. N.E. of Dumfries, with a station on the Caledonian railway company's branch from Dumfries to Locherbui. Pop. (1901) 1325. It is delightfully situated, there being eight lakes in the immediate neighbourhood, while the river Annan, and the Waters of Ae, Kinnel and Dryfe are in the vicinity. The town hall is a handsome edifice with clock tower. At the south end of Castle Loch, the chief lake, stand the ruins, a mere, shell of Lochmaben Castle, dating from the 13th century, where local tradition declares that Robert Bruce was born—an honour which is also claimed, however, for Turnberry Castle on the coast of Ayrshire. In the parish church is a bell said to have been presented to King Robert by the pope after reconciliation with him. A statue of the king stands in front of the town hall. Whether it were his birthplace or not, the associations of Bruce with Lochmaben were intimate. He exempted his followers in the district from feudal service and their descendants—the "kindly tenants of Lochmaben"—were confirmed in their tenure by the court of session in 1824. The Castle Loch is the only fresh water in Scotland, and possibly in the British Isles, where the vendace (Coregonus versicolor) occurs. This fish, which is believed to be growing scarcer, is alleged on doubtful authority to have been
LOCK, M.—LOCK

841

Introduced by Queen Mary. It is captured by the sweep-net in August, and is esteemed as a delicacy. The lakes adjoining the town afford the inhabitants exceptional advantages for the game of curling. There was once a team of Lochmaben Curlers entirely composed of shoemakers (souters) who held their own against all comers, and their prowess added the phrase "to souter" to the vocabulary of the sport, the word indicating a match in which the winners scored "game" to their opponents' "love." Lochmaben unites with Annan, Dumfries, Kirkcudbright and Sanquhar (the Dumfries burghs) in returning one member to parliament.

LOCK, MATTHIAS, English 18th-century furniture designer and cabinet-maker. The dates of his birth and death are unknown; but he was a disciple of Chippendale, and subsequently of the Adams, and was possibly in partnership with Henry Copeland (q.v.). During the greater part of his life he belonged to that flamboyant school which derived its inspiration from Louis XV. models; but when he fell under the influence of Robert Adam he absorbed his manner so completely that it is often difficult to distinguish between them, just as it is sometimes easy to confuse Lock's works with the lesser efforts of Chippendale. Thus from being extravagantly rococo he progressed to a simple ordered classicism. His published designs are not equal to his original drawings, many of which are preserved in the Victoria and Albert Museum, South Kensington, while the pieces themselves are often bolder and more solid than is suggested by the author's representations of them. He was a clever craftsman and holds a distinct place among the minor furniture designers of the second half of the 18th century.

Among his works, some of which were issued in conjunction with Copeland, are: A New Drawing Book of Ornaments (n.d.); A New Book of Ornaments (1768); A New Book of Pier Frames, Ovlast, Girandoles, Tables, &c. (1769); and A New Book of Foliage (1759).

LOCK (from the O. Eng. loc.; the word appears, in different forms, in many Teutonic languages; but with such various meanings as "hole," Ger. Loch, "lid," Swed. lock, &c.; probably the original was a root meaning "to enclose"); a fastening, particularly one which consists of a bolt held in a certain position by one or more movable parts which require to be placed in definite positions by the aid of a key or of a secret arrangement of letters, figures or signs, before the bolt can be moved. It is with such fastenings that the present article chiefly deals.

The word is also used, in the original sense of an enclosure or barrier, for a length of water in a river or canal, or at the entrance of a dock, enclosed at both ends by gates, the "lock-gates," and fitted with sluices, to enable vessels to be raised from a lower to a higher level or vice versa (see CANAL and DOCK). In guns and rifles the lock is the mechanism which effects the firing of the charge; it thus appears in the names of old types of weapons, such as wheel-lock, match-lock, flint-lock (see ARMS and ARMOUR, § Firearms; also GUN and RIFLE). Lock (Ger. Locke) in the sense of a curl or tuft of hair, the separate groups in which the hair naturally grows, may be, in ultimate origin, connected with the root of the main word. Lockjaw is the popular name of the disease known as tetanus (q.v.). The name "lock" is frequently used in English for hospitals for patients suffering from venereal diseases. According to the New English Dictionary there was in Southwark as early as 1453 a leper-hospital, known as the Lock Lazarette, which later was used for the treatment of venereal diseases. The name appears to have been used in the present sense as early as the end of the 17th century. Lock hospitals were established in London in 1745-1747 and in Dublin in 1754-1755.

The forms in which locks are manufactured, such as padlock, rim-lock, mortise-lock, one-sided or two-sided, &c., are essentially extremely numerous; and the variations in the details of construction of any one of these forms are still more numerous, so that it is impossible to do more here than describe the main types which have been or are in common use. Probably the earliest locks were of Chinese origin. Specimens of these still extant are quite as secure as any locks manufactured in Europe up to the 18th century, but it is impossible to ascertain the date of their manufacture. With the exception, in all probability, of these Chinese examples, the earliest lock of which the construction is known is the Egyptian, which was used four thousand years ago. In fig. 1, aa is the body of the lock, bb the bolt and cc the key. The three pins p, p, p drop into three holes in the bolt when it is pressed in, and so hold it fast; and they are raised again by putting in the key through the large hole in the bolt and raising it a little, so that the pins in the key push the locking pins up out of the way of the bolt. It was evidently for locks and keys of this nature that the prophet alluded: "And the key of the house of David will I lay upon his shoulder" (Isaiah xxii. 22), the word "mufilah" used in this passage being the common word for key to this day.

In the 18th century the European lock was nothing better than a mere bolt, held in its place, either shut or open, by a spring b (fig. 2), which pressed it down, and so held it at either one end or the other of the convex notch a; and the only impediment to opening it was the wards which the key had to pass before it could turn in the keyhole. But it was always possible to find the shape of the wards by merely putting in a blank key covered with wax, and pressing it against them; and when this had been done it was unnecessary to cut out the key into the complicated form of the wards (such as fig. 3), because no part of that key does any work except the edge be farthest from the pipe a; and so a key of the form fig. 4 would do just as well. Thus a small collection of skeleton keys, as they are called, of a few different patterns, was all the stock in trade that a lock-pick required.

The common single-tumbler lock (fig. 5) requires two operations instead of one to open it. The tumbler at turns on a pivot at 4, and has a square pin at a, which drops into a notch in the bolt bb, when it is either quite open or quite shut, and the tumbler must be lifted by the key before the bolt can be moved again. The tumbler offered little resistance to picking, as the height to which it might be lifted was not limited and the bolt would operate provided only that this height was sufficient; the improvement which formed the foundation of the modern key lock was the substitution of what is known as the "lever" for the tumbler, the difference being that the lever must be lifted to exactly the right height to allow the bolt to pass. This improvement, together with the obvious one of using more than one lever, was introduced in 1778 by Robert Barron, and is illustrated in figs. 6 and 7. Unless the square pin a (fig. 6) is lifted by the key to the proper height and no higher, the bolt cannot move. Fig. 8 illustrates the key of such a lock with four levers, the different distances between the centre of the key barrel and the edge of the bit being adapted to lift the levers to the respective heights required. This lock differs from the
modern lever lock only in the fact that Barron made his gating in the bolt and carried stumps on his levers, instead of having the main stump riveted into the bolt and the gatings in the levers as is the modern practice.

A lock operating on exactly the same principle but entirely different in construction (fig. 9) was invented by Joseph Bramah in 1784. It consists of an outer barrel epee, within which is a revolving barrel epee, held in place by a steel disk, dd, and provided with a pin b fixed eccentrically for operating the bolt; the barrel is prevented from turning by sheet metal sliders ss, which slide axially in radial grooves in the barrel and project into slots cut into the steel disk which is fastened to the case of the lock. Each slider has a gating cut in its outer edge sufficiently deep to allow it to embrace the inwardly projecting steel plate and turn it with the barrel. The key is of tubular form having slots cut in its end, each of a depth corresponding to the position of the gating in one of the sliders; so that, on inserting the key, each slider is pushed in—against a spring—exactly far enough to bring its slot opposite the steel disk; in this position the barrel carrying the sliders is turned by the key and actuates the bolt.

Up to 1851 it was generally believed that well-made lever locks of all types were practically unpickable, but at this time Alfred Charles Hobbs—an American—demonstrated, by picking the locks of Barron, Chubb, Bramah and others, that this belief was a fallacy. The method of Hobbs became widely known as the "tickling" or "tentative" method. In the modern lever lock the bolt carries a projecting piece—the "main stump"—which, when the levers are all raised to the proper height, enters the slots—"gatings"—in their faces. If, when the levers are not in this position, pressure is applied to the bolt, the main stump will press against the face of the levers; but owing to inaccuracies of workmanship and other causes the pressure will not be equal on all the levers. If now, the pressure on the bolt being maintained, each lever in turn is carefully raised a little, one will be found on which the pressure of the stump is greatest; this one is lifted till it becomes easy and then carefully lowered till it is sustained by the pressure of the stump in a new position. Another lever now bears the greatest pressure, and this in its turn is similarly treated. By this gradual or "tentative" process the levers will in time all be raised to the correct height and the bolt will slip back without, if sufficient care has been exercised, any of the levers having been raised above its correct position. Although this method of picking only became generally known in 1851, it is evident that it was not novel, since in 1817 one of Bramah's workmen, named Russell, invented the use of false notches or gatings, which were slots similar to the true gating but of small depth cut in the face of the levers. Similar false gatings were used in Anthony Radford Strutt's lock in 1819. The only possible object of these gatings—two of which are shown in each of the sliders of Bramah's lock—was to prevent the tentative method of picking. They are, however, not efficient for their purpose although they render the operation more difficult and tedious.

The best-known locks up to 1851 were those of Jeremiah Chubb, their popularity being due to their superior workmanship and probably still more to their title "detector." His lock, patented in 1818, contained a device intended to frustrate attempts at picking, and further to detect if such an attempt had been made. This device, at any rate as far as detecting was concerned, had been anticipated by the patent of Thomas Russell in 1816. Since the device only comes into operation when any lever is raised too high, it is not effective against a skilful application of the tentative method. The original form of this lock is shown in fig. 10, when the lever DT, which turns on a pin in the middle, is acted upon at its end T by a spring S, which will evidently allow some play to the lever on either side of the corner X; but the moment it is pushed past that point the spring will carry it farther in the same direction, like what is called in clock-work a jumper. In its proper position that end always remains above the turning-point; but, if any one of the tumblers is raised too high, the other end D of the detector, which reaches over all the levers, is lifted so far that the end T is sent down below the corner, and the tooth T then falls into a notch in the bolt, and so prevents it from being drawn back, even though all the levers are raised properly by the right key. It thus at once becomes obvious that somebody has been trying to pick the lock. The way to open it, then, is to turn the key the other way, as if to overlock the bolt; a short piece of gating near the end of the levers allows the bolt to advance just far enough to push the tooth of the detector up again by means of its inclination there, and then the lock can be opened as usual. To render the mechanism of locks more inaccessible for picking purposes, two devices, the "curtain" and the "barrel," were in use; these devices were simply the one a disk and the other a cylinder carrying a keyhole which revolved with the key and so closed the fixed keyhole in the case.

It is to Hobbs himself that we are indebted for the invention of the movable stump, since called the safety lever, the only device introduced rendering the tentative method of picking inoperative. This invention was incorporated in the "protector" locks of Hobbs, Hart & Co.; it consists in the employment of a movable main stump which is not riveted into the bolt as usual, but is set on the end of a bent lever abc (fig. 11) which lies in a hollow of the bolt A behind it, turning on a pivot in the bolt itself, and kept steady by a small friction-spring e. The stump comes through a hole in the bolt large enough to let it have a little play: and the long end a of the lever stands just above the edge of the pin d, which is fixed in the back plate of the lock. When the lock is locked, if the bolt be pushed...
back, no sensible pressure on the levers is produced, but only just enough to turn this protector lever, as Hobbs called it, on its pivot, c, and so bring down its end a in front of the square pin, and then the bolt can no more be pushed back than when held by Chubb's detector. The protector is set free again by merely pushing the bolt forward with the key, without reference to the levers. However, the protector could be prevented from acting by a method used by the inventor himself for another purpose, viz., by pushing a piece of watch-spring through the keyhole, and up behind the bolt, so as to reach the protector lever and keep it up while the bolt was pushed back, or, again, by pushing up the watch-spring between any two of the levers, and holding it by pushing the stump across the levers. Both these devices, however, are prevented now by letting in a feather FF in a groove between the bolt and the back of the lock, which no watch-spring can pass, and also bringing a piece of the feather forward through the front gating of the levers just under the stump. In this form the lock is safe against any mode of picking known. A lock possessing valuable features was invented in 1842 by Sir Edmund Becket—or rather Lord Grimthorpe—but did not come into general use for commercial reasons.

All the locks containing many levers so far described have a common defect in that the levers are moved in one direction by the key and in the other by springs. But it is not infrequently happens that dirt or grease gets between the levers and causes two or more to stick together, in which case one of them is lifted too high and the bolt is prevented from operating. To overcome this difficulty locks, especially those intended for safes, have been made so that alternate levers move in opposite directions, the key having to cover two or more opposite sides. This construction entails that the key enter the body of the lock, instead of passing below them, an arrangement that had previously been in use to reduce the space into which gunpowder could be pushed through the keyhole.

The key locks chiefly used in English safes have been the ordinary lever lock with 6-8 or 10 levers, Chubb's "detector," Hobbs' protector, or variants of these. In the Yale lock, which reverts in some degree to the idea of the ancient Egyptian lock, America has produced one key lock which has come into almost universal use in that country and is certainly worthy of note. The key of this lock, shown full size in Fig. 12, is remarkably small being stamped from a piece of flat steel and weighing only a small fraction of an ounce. The barrel abc can turn round, as there is no plug either projecting from it or projecting into it. But when the key is out, all the plugs are pushed down by the springs, and so the upper ones descend into the barrel and hold it fast again. If any of the steps of a false key are too high some of the lower plugs will be pushed up beyond the barrel into the holes above them, and so the barrel cannot turn. The bevelled end of the key near a enables it to be pushed in under the plugs, though with some friction and resistance.

It is frequently convenient to have a number of different locks so arranged that, whilst each has its own individual key, yet one special or "master" key will operate any of the series. In varied locks this is done by "differing" the individual locks so that each key will only pass its own lock, and then filing away the bit of an extra key so that it will pass all the wards; the objection to this method is that any of the individual keys can easily be filed away and so form a master key, which meets this objection, consists in making all the levers except one—or if need be two—of each lock alike and cutting another gating or widening the gating in the differing levers, so as to pass the master key which has one or two—individual key.

The growth of safe deposits has called for special locks so that when a box changes tenants the outgoing tenant's key shall be useless. In some cases the lock has been taken off and another substituted, but this is clumsy and now rarely employed, and has been superseded by the use of changeable key locks.

The first of these, invented by Robert Newell in 1841, was introduced into Great Britain from America by Hobbs in 1851. A simpler form, the construction of which is clearly shown by fig. 13, was brought out by Hobbs, Hart & Co. The bolt of this lock, instead of the ordinary main stump, carries a set of sliders, PPS, one corresponding to each lever and carrying a projection S corresponding to a portion of the main stump. It will be seen that if any key having steps of certain lengths is inserted when the lock is unlocked and the bolt B thrown thereby, each slider will be raised to a height corresponding to that to which its lever is raised by the key, and the two fixed teeth CC will engage two of the teeth in the front of each slider, so that they will be held in place ready to enter the lever gatings when the same key is inserted.

A changeable key lock introduced by the Chatwood Safe Co. has no gatings in the levers, whose fronts are cut with teeth gearing into similar teeth cut in a set of disks carrying the gatings. The disks are mounted on a stud which can be moved by a key from the back of the lock, and the teeth of each disk are cut in such a way as to slip the main stump in the gatings—keeping the disks in position—the disks are carried forward out of gear with the levers; the key can then be removed and another having steps of suitable length inserted and turned so as to raise the levers, the disks being then brought back into gear.

Both the above locks require that the key steps should have certain definite lengths corresponding to the teeth, but a later lock resembling to some extent that brought out by Hobbs, Hart & Co. has been introduced by the Chatwood Co., in which it is sufficient after unlocking the lock to file any of the key steps and so alter the pattern of the levers in such a way that both the main stump and the safe locks. The slides composing the main stump are not provided with teeth, the changing being effected as follows: when
the bolt is partly shot by the correct key, the screw which binds the sliders together as it comes opposite an opening in the back of the case is loosened, the key is removed and altered—or a fresh key substituted—and is inserted so as to lift the levers to their correct height and expose the clamping screw on the back, which is then tightened. This lock is now commonly used for safe deposits, combined with a small lever lock of which the custodian carries the key, and which either blocks the bolt of the main lock or covers the keyhole.

In combination with changeable key locks requiring key steps of definite lengths, much ingenuity has been displayed in designing keys with movable bits or steps, as fig. 15, which are useful chiefly as clamps or security devices, such as are built up to match the key from time to time in use, and then deposited in some bank or other secure place to be used in case of emergency.

From the earliest times secret devices, either to hide keyholes or to take the place of locks proper, have been in use; these are to-day only seriously represented by " combination " locks which, whilst following the same general principles as key locks, differ entirely in construction. Locks in which the arranging of the internal parts in their proper positions was secured by the manipulation of external parts marked with letters or numbers were common in China in very early times, but their history is unfortunately lost. This form of lock has been developed to a very high degree of perfection and is, for safes, in almost universal use to-day in America.

The American lock consists of a series of disks mounted upon one spindle, only one, however, the bolt lock—being first thrown, is provided each with a gating into which a stamp connected with the bolt can drop when all the gatings lie upon a given line parallel to the axis of the spindle. Each disk is provided with a driving pin so arranged that when in its proper position, pin No. 1, the first ring, etc., the pin is driven into a slot in the inner face of the pin. The gating in the bolt disk and the portion of the stump which enters it are so formed that the disk can draw the bolt back. The spindle is provided on the outside with a knob and graduated disk divided into 100 divisions—surface of a annulus on which a fixed position is denoted. Each disk, including the bolt disk, is provided with a pin projecting from its surface in such a way that the pin of one disk comes into contact with that of the next disk and drives it round. If, then, the bolt disk being at the back, there are three letter disks and the spindle is rotated to the left, the bolt disk will in the course of one revolution pick up letter disk No. 1 counting from the bolt disk—in the second revolution it will pick up letter disk No. 2. The revolution of the disk is continued for part of a revolution till No. 3 is picked up, and then is again repeated (No. 3 obviously not being disturbed) and is then reversed. No. 1 is again left behind and picked up in the first revolution to the left, the motion being continued till the correct position of No. 1 is reached, when, on reversing the gaging in the bolt disk comes into the correct position, the stump falls and a continuance of the motion to the right draws back the bolt. A lock constructed in this way would be of little utility, as the combination would have to be determined once for all by the maker. The difficulty is got over by making the letter disks in two parts, the inner part carrying the driving pin and the outer the gating; these two parts are locked together by small cams or other devices which come into such a position that they can be removed by a second bolt lock when in place. The combination lock is set by altering the position of the inner disks with the driving pins in relation to the outer part carrying the gatings which are meanwhile held steady by the square key.

One advantage of the combination lock is that there is no key to be lost or stolen, but the means adopted by burglars, especially in America, are such that even this is not a perfect protection, cases having occurred in which a person has been compelled to disclose the combination. With key locks the keyhole through the safe door forms a distinct point of danger, and with combination locks the spindle passing through it is at least twice exposed. In America these two risks time locks were introduced in America and have been used in Europe. Essentially the time lock consists of a high-class chronometer or watch mechanism, little liable to get out of order, driving a disk provided with a gating such that the bolt can only enter the gating during certain hours; as a rule two, three or four chronometers are used, any one of which can release the lock.

The Yale time lock contains two chronometer movements which revolve two dial plates studded with twenty-four pins to represent the twenty-four hours of the day. These pins, when pushed in, form a track on which run rollers supporting the lever which secures the bolt or locking agency, but when they are drawn out the track is broken, the rollers fall down and the bolt is released. By pulling out the day pins, say from 9 till 4, the door is automatically prepared to open. In the rest of running a period of twenty-four hours is added to the locked interval. Careful provision is made in each of the revolutions of running the clock motion, by which the rightful owner might be seriously incommoded by the burglar. In the Yale lock, just before the chronometers run out, a trigger is released which depresses the lever by which the bolt is held in position. (A. B. Ch.)

**LOCKE, JOHN** (1632-1704), English philosopher, was born at Wrington, to 10 m. W. of Belloton, in Somersetshire, on the 29th of August 1632, six years after the death of Bacon, and three months before the birth of Spinoza. His father was a small landowner and attorney at Pensford, near the northern boundary of the county, to which neighbourhood the family had migrated from Yorkshire in the first decade of the 17th century. The elder Locke, a strict but genial Puritan, by whom the son was carefully educated at home, was engaged in the military service of the parliamentary party. "From the time that I knew anything," Locke wrote in 1660, "I found myself in a storm, which has continued to this time." For fourteen years his education, more or less interrupted, went on in the rural home at Belloton, on his father's little estate, half a mile from Pensford, and 6 m. from Bristol. In 1646 he entered Westminster School and remained there for six years. Westminster was uncongenial to him. Its memories perhaps encouraged the bias against public schools which afterwards disturbed his philosophic calm in his *Thoughts on Education*. In 1652 he entered Christ Church, Oxford, then under John Owen, the Puritan dean and vice-chancellor of the university. Christ Church was Locke's occasional home for thirty years. For some years after he entered, Oxford was ruled by the Independents, who, largely through Owen, unlike the Presbyterians, were among the first in England to advocate genuine religious toleration. But Locke's hereditary sympathy with the Puritans was gradually lessened by the intolerance of the Presbyterians and the fanaticism of the Independents. He had found in his youth, he says, that "what was called general freedom was general bondage, and that the popular assertions of liberty were the greatest engrossers of it too, and not unfitly called its keepers." And the influence of the liberal divines of the Church of England afterwards showed itself in his spiritual development.

Under Owen scholastic studies were maintained with a formality and dogmatism unsuited to Locke's free inquisitive temper. The aversion to them which he expressed showed thus early an innate disposition to rebel against empty verbal reasoning. He was not, according to his own account of himself to Lady Masham, a hard student at first. He sought the company of pleasant and witty men, and thus gained knowledge of life. He took the ordinary bachelor's degree in 1656, and the master's in 1658. In December 1660 he was serving as tutor of Christ Church, lecturing in Greek, rhetoric and philosophy. At Oxford Locke was nevertheless within reach of liberal intellectual influence tending to promote self-education and strong individuality. The metaphysical works of Descartes had appeared a few years before he went to Oxford, and the *Human Nature* and *Leviathan* of Hobbes during his undergraduate years. It does not seem that Locke read extensively, but he was attracted by Descartes. The first books, he told Lady Masham, which gave him a relish for philosophy, were those of this philosopher, although he very often differed from him. At the Restoration potent influences were drawing Oxford and England into experimental inquiries. Experiment in physics became the fashion. The Royal Society was then founded, and we find Locke experimenting in chemistry in 1663, also in meteorology, in which he was particularly interested all his life.
The restraints of a professional career were not suited to Locke. There is a surprise that early in his Oxford career he contemplated taking orders in the Church of England. His religious disposition attracted him to theology. Revulsion from the dogmatic temper of the Presbyterians, and the unreasoning enthusiasm of the Independents favoured sympathy afterwards with Cambridge Platonists and other liberal Anglican churchmen. Whitchote was his favourite preacher, and close intimacy with the Cudworth family cheered his later years. But, though he has a place among lay theologians, dread of ecclesiastical impediment to free inquiry, added to strong inclination for scientific investigation, made him look to medicine as his profession, and before 1666 we find him practising as a physician in Oxford. Nevertheless, although known among his friends as “Doctor Locke,” he never graduated in medicine. His health was uncertain, for he suffered through life from chronic consumption and asthma. A fortunate event soon withdrew him from the medical profession.

Locke early showed an inclination to politics, as well as to theology and medicine. As early as 1656 he diverged for a short time from medical pursuits at Oxford, and was engaged as secretary to Sir Walter Vane on his mission to the Elector of Brandenburg. Soon after his return in 1666 the incident occurred which determined his career. Lord Ashley, afterwards first earl of Shaftesbury, had come to Oxford for his health. Locke was introduced to him by his physician, Dr Thomas. This was the beginning of a lasting friendship, sustained by common sympathy with liberty—civil, religious and philosophical. In 1667 Locke moved from Christ Church to Exeter House, Lord Ashley’s London residence, to become his confidential secretary. Although he retained his studentship at Christ Church, and occasionally visited Oxford, as well as his patrimony at Belliton, he found a home and shared fortune with Shaftesbury for fifteen years.

Locke’s commonplace books throw welcome light on the history of his mind in early life. A paper on the “Roman Commonwealth” which belongs to this period, expresses convictions about religious liberty and the relations of religion to the state that were modified and deepened afterwards; objections to the sacerdotal conception of Christianity appear in another article; short work is made of ecclesiastical claims to infallibility in the interpretation of Scripture in a third; a scheme of utilitarian ethics, wider than that of Hobbes, is suggested in a fourth. The most significant of those early revelations is the Essay Concerning Toleration (1666), which anticipates conclusions more fully argued nearly thirty years later.

The Shaftesbury connexion must have helped to save Locke from those idols of the “Den” to which professional life and narrow experience is exposed. It brought him into contact with public men, the springs of political action and the duties of high office. The place he held as Shaftesbury’s adviser is indeed the outstanding circumstance in his middle life. Exeter House afforded every opportunity for society. He became intimate among others with the illustrious Sydenham; he joined the Royal Society and served its council. The retention of the monumental work of his life was laid when he was at Exeter House. He was led to it in this way. It was his habit to encourage informal reunions of his intimates, to discuss debatable questions in science and theology. One of these, in the winter of 1670, is historically memorable. “Five or six friends,” he says, met in his rooms and were discussing “principles of morality and religion. They found themselves quickly at a stand by the difficulties that arose on every side.” Locke proposed some criticism of the necessary “limits of human understanding” as likely to open a way out of their difficulties. He undertook to attempt this, and fancied that what he had to say might find sufficient space on “one sheet of paper.” What was thus “begun by chance, was continued by entreaty, written by incoherent parcels, and after long intervals of neglect resumed again as humour and occasions permitted.” At the end of nearly twenty years the issue was given to the world as Locke’s now famous Essay Concerning Human Understanding.

The fall of Shaftesbury in 1675 enabled Locke to escape from English politics. He found a retreat in France, where he could unite calm reflection upon the legitimate operations of “human understanding” with attention to his health. He spent three years partly at Montpellier and partly in Paris. His journals and commonplace books in these years show the Essay in preparation. At Paris he met men of science and letters—Peter Guenellon, the well-known Amsterdam physician; Ole Römer, the Danish astronomer; Thonyard, the critic; Melchisédech Thévenot, the traveller; Henri Justel, the jurist; and François Bernier, the expositor of Gassendi. But there is no mention of Malebranche, whose Recherche de la vérité had appeared three years before, nor of Arnauld, the illustrous rival of Malebranche.

Locke returned to London in 1679. Reaction against the court party had restored Shaftesbury to power. Locke resumed his old confidential relations, now at Thanet House in Aldersgate. A period of often interrupted leisure for study followed. It was a time of plots and counterplots, when England seemed on the brink of another civil war. In the end Shaftesbury was committed to the Tower, tried and acquitted. More insurrectionary plots followed in the summer of 1682, after which, suspected at home, the versatile statesman escaped to Holland, and died at Amsterdam in January 1683. In these two years Locke was much at Oxford and in Somerset, for the later movements of Shaftesbury did not commend themselves to him. Yet the government had their eyes upon him. “John Locke lives a very cunning unintelligible life here,” Prideaux reported from Oxford in 1682. “I may confidently affirm,” wrote John Fell, the dean of Christ Church, to Lord Sunderland, “there is not any one in the college who has heard him speak a word against, or so much as censuring, the government; and, although very frequently, both in public and private, discourses have been purposely introduced to the disparagement of his master, the earl of Shaftesbury, he could never be provoked to take any notice, or discover in word or look the least concern; so that I believe there is not in the world such a master of taciturnity and passion.” Unpublished correspondence with his Somerset friend, Edward Clarke of Chipley, describes Locke’s life in those troubled years. It also reveals the opening of his intimate intercourse with the Cudworth family, who were friends of the Clarks, and connected by birth with Somerset. The letters allude to toleration in the state and comprehension in the church, while they show an indifference to theological dogma hardly consistent with an exclusive connexion with any sect.

In his fifty-second year, in the gloomy autumn of 1683, Locke retired to Holland, then the asylum of eminent persons who were elsewhere denied liberty of thought. Descartes and Spinoza had speculated there; it had been the home of Erasmus and Grotius; it was now the refuge of Bayle. Locke spent more than five years there; but his (unpublished) letters show that exile sat heavily upon him. Amsterdam was his first Dutch home, where he lived in the house of Dr Keen, under the assumed name of Dr Van der Linden. For a time he was in danger of arrest at the instance of the English government. He was afraid to publish his book; but he was deprived of his studentship at Christ Church by order of the king, and Oxford was thus closed against him. Holland introduced him to new friends. The chief of these was Limborch, the successor of Episcopius as Remonstrant professor of theology, lucid, learned and tolerant, the friend of Cudworth, Whichcote, and More. By Limborch he was introduced to Le Clerc, the youthful representative of letters and philosophy in Limborch’s college, who had escaped from Geneva and Calvinism to the milder atmosphere of Holland and the Remonstrants. The Bibliothèque universelle de Le Clerc was then the chief organ in Europe of men of letters. Locke contributed several articles. It was his first appearance as an author, although he was now fifty-four years of age. This tardiness in authorship is a significant fact in his life, in harmony with his tempered wisdom.

In the next fourteen years the world received through his books the thoughts which had been gradually forming, and were taking final shape while he was in Holland. The Essay was finished there, and a French epitome appeared in 1688 in Le
Locke's, journal, the forecast of the larger work. Locke was then at Richmond, where he lived for a year in the house of a Quaker friend, Benjamin Furley, or Furlay, a wealthy merchant and lover of books. At Richmond he was a confidant of political exiles, including Burnet and the famous earl of Peterborough, and he became known to William, prince of Orange. William landed in England in November 1688; Locke followed in February 1689, in the ship which carried the princess Mary.

After his return to England in 1689 Locke emerged through authorship into European fame. Within a month after he reached London he had declined an offer of the embassy to Brandenburg, and accepted the modest office of commissioner of appeals. The two following years, during which he lived at Dorset Court in London, were memorable for the publication of his two chief works on social policy, and of the epoch-making book on modern philosophy which reveals the main principles of his life. The earliest of these to appear was his defence of religious liberty, in the Epistolae de Tolerantia, addressed to Limborch, published at Gouda in the spring of 1689, and translated into English in autumn by William Popple, a Unitarian merchant in London. Two Treatises on Government, in defence of the right of ultimate sovereignty in the people, followed a few months later. The famous Essay concerning Human Understanding saw the light in the spring of 1690. He received £30 for the copyright, nearly the same as Kant got in 1781 for his Kritik der reinen Vernunft. In the Essay Locke was the critic of the empirical data of human experience: Kant, as the critic of the intellectual and moral presuppositions of experience, supplied the complement to the incomplete and ambiguous answer to its own leading question that was given in Locke's Essay. The Essay was the first book in which its author's name appeared, for the Epistolae de Tolerantia and the Treatises on Government were anonymous.

Locke's asthma was aggravated by the air of London; and the course of public affairs disappointed him, for the settlement at the Revolution fell short of his ideal. In spring, 1691, he took up his residence in the manor house of Otes in Essex, the country seat of Sir Francis Masham, between Ongar and Harlow. Lady Masham was the accomplished daughter of Ralph Cudworth, and was his friend before he went to Holland. She told Le Clerc that after Locke's return from exile, "by some considerably long visits, he had made trial of the air of Otes, which is some 20 m. from London, and he thought that none would be so suitable for him. His company," she adds, "could not but be very desirable for us, and he had all the assurances we could give him of being always welcome; but, to make him easy in living with us, it was necessary he should do so on his own terms, which Sir Francis at last assenting to, he then believed himself at home with us, and resolved, if it pleased God, here to end his days as he did." At Otes he enjoyed for fourteen years as much domestic peace and literary leisure as was consistent with broken health, and sometimes anxious visits to London on public affairs, in which he was still an active adviser. Otes was in every way his home. In his letters and otherwise we have pleasant pictures of his domestic life and the occasional visits of his friends, among others Lord Peterborough, Lord Shaftesbury of the Characteristicks, Sir Isaac Newton, William Molyneux and Anthony Collins.

At Otes he was busy with his pen. The Letter on Toleration involved him in controversy. An Answer by Jonas Proast of Queen's College, Oxford, had drawn forth in 1690 a Second Letter. A rejoinder in 1691 was followed by Locke's elaborate Third Letter on Toleration in the summer of the following year. In 1691 currency and finance were much in his thoughts, and in the following year he addressed an important letter to Sir John Somers on the Consequences of the Lowering of Interest and Rising the Value of Money. When he was in Holland he had written letters to his friend Clarke of Chipley about the education of his children. These letters formed the substance of the little volume entitled Thoughts on Education (1693), which still holds its place among classics in that department. Nor were the "principles of revealed religion" forgotten. The subtle theological controversies of the 17th century made him anxious to show how simple after all fundamental Christianity is. In the Reasonableness of Christianity as delivered in the Scriptures (anonymous, 1695), Locke sought to separate the divine essence of Christ's religion from later accretions of dogma, and from reasonings due to oversight of the necessary limits of human thought. This intended Eirenicon involved him in controversies that lasted for years. Angry polemics assailed the book. A certain John Edwards was conspicuous. Locke's Vindication, followed by a Second Vindication in 1697, added fuel to this fire. Above all, the great Essay was assailed and often misinterpreted by philosophers and divines. Notes of opposition had been heard almost as soon as it appeared. John Norris, the metaphysical rector of Bemerton and English disciple of Malebranche, criticized it in 1690. Locke took no notice at the time, but his second winter at Otes was partly employed in An Examination of Malebranche's Opinion of Seeing all Things in God, and in Remarks upon some of Mr Norris's Books, tracts which throw light upon his own ambiguous theory of perception through the senses. These were published after his death. A second edition of the Essay, with a chapter added on "Personal Identity," and numerous alterations in the chapter on "Power," appeared in 1694. The third, which was only a reprint, was published in 1695. Wynne's well-known abridgment helped to make the book known in Oxford, and his friend William Molyneux introduced it in Dublin. In 1695 a revival of controversy about the currency diverted Locke's attention. Events in that year occasioned his Observations on Silver Money and Further Considerations on Raising the Value of Money.

In 1696 Locke was induced to accept a commissionership on the Board of Trade. This required frequent visits to London. Meantime the Essay on Human Understanding and the Reasonableness of Christianity were becoming more involved in a wordy warfare between dogmatists and latitudinarians, trinitarians and unitarians. The controversy with Edwards was followed by a more memorable one with Stilliglief, bishop of Worcester. John Toland, in his Christianity not Mysterious, had exaggerated doctrines in the Essay, and then adopted them as his own. In the autumn of 1696, Stilliglief, an argumentative ecclesiastic more than a religious philosopher, in his Vindication of the Doctrine of the Trinity, charged Locke with disallowing mystery in human knowledge, especially in his account of the metaphysical idea of "substance." Locke replied in January 1697. Stilliglief's rejoinder appeared in May, followed by a Second Letter from Locke in August, to which the bishop replied in the following year. Locke's Third Letter, in which the ramifications of this controversy are pursued with a copious expenditure of acute reasoning and polished irony, was delayed till 1699, in which year Stilliglief died. Other critics of the Essay entered the lists. One of the ablest was John Sergeant, a priest of the Roman Church, in Solid Philosophy Asserted Against the Fancies of the Idealists (1697). He was followed by Thomas Burnet and Dean Sherlock. Henry Lee, rector of Tichmarsh, criticized the Essay, by a letter to the author (1702); John Brougham dealt another blow in his Psychologia (1703); and John Norris returned to the attack, in his Theory of the Idea or Intelligible World (1701-1704). On the other hand Locke was defended with vigour by Samuel Bolde, a Dorsetshire clergyman. The Essay itself was meanwhile spreading over Europe, impelled by the name of its author as the chief philosophical defender of civil and religious liberty. The fourth edition (the last while Locke was alive) appeared in 1700, with important additional chapters on "Association of Ideas" and "Enthusiasm." What was originally meant to form another chapter was withheld. It appeared among Locke's posthumous writings as The Conduit of the Understanding, one of the most characteristic of his works. The French translation of the Essay by Pierre Coste, Locke's amanuensis at Otes, was issued almost simultaneously with the fourth edition. The Latin version by Richard Burridge of Dublin followed a year after, reprinted in due time at Amsterdam and at Leipsig.

In 1700 Locke resigned his commission at the Board of Trade,
and devoted himself to Biblical studies and religious meditation. The Gospels had been carefully studied when he was preparing his *Reasonableness of Christianity*. He now turned to the Epistles of St Paul, and applied the spirit of the *Essay* and the ordinary rules of critical interpretation to a literature which he venerated as infallible, like the pious Puritans who surrounded his youth. The work was ready when he died, and was published two years after. A tract on *Miracles*, written in 1702, also appeared posthumously. Fresh adverse criticism of the *Essay* was reported to him in his last year, and the book was formally condemned by the authorities at Oxford. "I take what has been done rather as a recommendation of the book," he wrote to his young friend Anthony Collins, "and when you and I next meet we shall be merry on the subject." One attack only moved him. In 1704 his adversary, Jonas Proast, revived their old controversy. Locke in, consequence began a Fourth Letter on Toleration. A few pages, ending in an unfinished paragraph, exhausted his remaining strength; but the theme which had employed him at Oxford more than forty years before, and had been a ruling idea throughout the long interval, was still dominant in the last days of his life.

All the summer of 1704 he continued to decline, tenderly nursed by Lady Masham and her daughter Esther. On the 28th of October he died, according to his last recorded words, "in perfect charity with all men, and in sincere communion with the whole church of Christ, by whatever names Christ's followers call themselves." His grave is on the south side of the parish church of High Laver, in which he often worshiped, near the tombs of the Mashams, and of Damasari, the widow of Cudworth. At the distance of 1 m. are the garden and park where the manor house of Otes once stood.

Locke's writings have made his intellectual and moral features familiar. The reasonableness of taking probability as our guide in life was in the essence of his philosophy. The desire to see for himself what is true in the light of reasonable evidence, and that others should do the same, was his ruling passion, if the term can be applied to one so calm and judicial. "I can no more know anything by another man's understanding," he would say, "than I can see by another man's eyes." This repugnance to believe blindly what rested on arbitrary authority, as distinguished from what was seen to be sustained by self-evident reason, or by demonstration, or by good probable evidence, runs through his life. He is typically English in his reverence for facts, whether facts of sense or of living consciousness, in his aversion to the verbal and the verbalistic, in his suspicion of mysticism, in his calm reasonableness, and in his ready submission to truth, even when truth was incapable of being fully reduced to system by man. The delight he took in exercising reason in regard to everything he did was what his friend Pierre Coste remarked in Locke's daily life at Otes. "He went about the most trilling things always with some good reason. Above all things he loved order; and he had got the way of observing it in everything with wonderful exactness. As he always kept the useful in his eye in all his disquisitions, he esteemed the employments of men only in proportion to the good they were capable of producing; for which cause he had no great value for the critics who waste their lives in composing words and phrases in coming to the choice of a various reading, in a passage that has after all nothing important in it. He could yet less for those professed disputants, who, being taken up with the desire of coming off with victory, justify themselves behind the ambiguity of a word, to give their adversaries the more trouble. And whenever he had to deal with this sort of folks, if he did not beforehand take a strong resolution of keeping his temper, he quickly fell into a passion; for he was naturally choleric, but his anger never lasted long. If he retained any resentment it was against himself, for having given way to so ridiculous a passion; which, as he used to say, "may do a great deal of harm, but never yet did anyone the least good." Large, "round-about " common sense, intellectual strength directed by a virtuous purpose, not subtle or daring speculation sustained by an idealizing faculty, in which he was deficient, is what we find in Locke. Defect in speculative imagination appears when he encounters the vast and complex problem of the universe in its organic unity.

Locke is apt to be forgotten now, because in his own generation he so well discharged the intellectual mission of initiating criticism of human knowledge, and of diffusing the spirit of free inquiry and universal toleration which has since profoundly affected the civilized world. He has not bequeathed an imposing system, hardly even a striking discovery in metaphysics, but he is a signal example in the Anglo-Saxon world of the love of attainable truth for the sake of truth and goodness. "If Locke made few discoveries, Socrates made none." But both are memorable in the record of human progress.

An inscription on his tomb, prepared by himself, Locke refers to his books as a true representation of what he was. They are concerned with *Social Economy, Christianity*, *Education and Philosophy*, besides Miscellaneous writings.

II. *Christianity.*—(1) The Reasonableness of Christianity as delivered in the Scriptures (1662). (2) *A Vindication of the Reasonableness of Christianity from Mr Edwards's Reflections* (1665). (3) A *Treatise of the Religious Interest* (1697). (4) A Paraphrase and Notes on the Epistles of St Paul to the Galatians, First and Second Corinthians, Romans and Ephesians. To which is prefixed an Essay for the understanding of St Paul's Epistles by members of the Church he himself translated into English from the Latin (1706, posthumous). (5) A Discourse of Miracles (1716, posthumous).

III. *Education.*—(1) Some Thoughts concerning Education (1693). (2) *The Conduct of the Understanding* (1709, posthumous). (3) Some Thoughts concerning the First Use of Words (1710, posthumous). (4) Instructions for the Conduct of a Young Gentleman (1706, posthumous). (5) Of Study (written in France in Locke's journal, and published in *L. King's Life of Locke* in 1830).

IV. *Philosophy.*—(1) *An Essay concerning Human Understanding*, in four books (1690). (2) A Letter to the Bishop of Worcester concerning some passages relating to Mr Locke's Essay of Human Understanding in a late Discourse of his Lordship's in Vindication of Equality (1705). (3) The *Letters concerning Dr. Clarke's *Essays* (1706). (4) The Rule of a Society that would not cease a Week, for their improvement in useful Knowledge, and for the Promotion of Truth and Christian Charity (1706). (5) A Letter from a Person of Quality to his Friend in the Country, published in 1705 (included by De Maizaux in his Collection of Several Pieces by Mr. Locke, 1783). (6) The Letters of common hangman by orders from the House of Lords, was disavowed by Locke himself. It may have been dictated by Shaftesbury. There are also miscellaneous Letters and public notices, published in the *Letters and Papers of Lord King* (1809) and of Mr Fox Bourne (1876).

Letters from Locke to Topham, Limborch, Le Clerc, Guennelon, Collin, Sis, Isaac Newton, the first and the third Lord Shaftesbury, Lords Peterborough and Pembroke, Clarke of Chipley and others, are preserved in the letter-books of them in the keeping of Lord Lovelace at Horseley Towers, and Lord Sanford at Nynhead in Somerset, or in the British Museum. They express the gracious courtesy and playful humour which were natural to him, and his varied interests in human life.

I. *Social Economy.*—It has been truly said that all Locke's writings, even the *Essay on Human Understanding* itself, were occasional, and intended directly to counteract the enemies of reason and freedom
in his own age." This appears in his works on social polity, written at a time when the principles of democracy and toleration were struggling with divine right of kings, and when "the popular assertions of public liberty were the greatest engrossers of talk the states man wrote." But the terms of the contract might be as well applied to the sovereign people themselves, from time to time, in accommodation to changing circumstances. He saw that things in this world were in a constant flux, so that no society could remain long in the same form. And he maintained that the only way for the sovereign people to retain the control without actual surrender of the right to govern was to "abide" the general will. Locke's ideas of the separation of powers are to be found in the Second Treatise on Government, in which he states that the government is divided into three branches: the executive, the legislative, and the judiciary. The executive branch is responsible for the enforcement of laws and the protection of the nation. The legislative branch is responsible for the making of laws, and the judiciary branch is responsible for the interpretation of laws. Locke believed that these three branches should be independent of each other, and that the executive branch should not have the power to make laws or judge cases. This is known as the separation of powers theory, and it is a fundamental principle of modern democratic government. The separation of powers theory is based on the idea that power should be divided among different branches of government to prevent any one branch from becoming too powerful. The doctrine of judicial review is an outgrowth of Locke's ideas on the separation of powers. Judicial review is the power of the courts to declare laws passed by Congress or the states to be unconstitutional. This power is necessary to ensure that the government does not exceed its powers and that the rights of the people are protected. Locke's ideas on the separation of powers and judicial review have had a profound influence on the development of modern democratic government.
of mind marked by him as most apt to interfere with the formation of beliefs in harmony with the Universal Reason that is active in the universe.

IV. Philosophy.—The Essay Concerning Human Understanding embodies Locke's philosophy. It was the first attempt on a great scale, and in the Baconian spirit, to estimate critically the certainty and the adequacy of human knowledge, when confronted with God and the universe.

In the preface, "to the Essay is the keynote to the whole. The ill-fortune of men in their past endeavours to comprehend themselves and their environment is attributed in a great measure to their disposition to extend their inquiries into matters beyond the reach of human understanding. To inquire with caution as to "the original, certainty and extent of human knowledge, together with the grounds and degrees of belief, opinion and assent," is accordingly Locke's design in this Essay. "Excluding from his enquiry "the physical and metaphysical sciences,"" it was regarded as a task based on an introspective study of consciousness, as to how far a human understanding of the universe can reach. Although his report might show that our knowledge at its highest must be far short of perfection, or perhaps infinitesimal, it might still be "sufficient" for us, because "suited to our individual state." The "light of reason," the "candle of the Lord," that is set up in us may be found to shine bright enough for all our purposes. If human understanding, in its present state, cannot reach the universe, man may at least see that at no stage of his finite experience he is necessarily the sport of chance, and that he can practically secure his own wellbeing.

The Essay, which treats of Knowledge and Probability, is concerned more directly than the three preceding ones with Locke's professed design. It has been suggested that Locke may have begun this book. It contains few references to the foregoing pages; and in some cases a reference to a "fuller" treatment in books 2 and 3. It was probably a "light" study of the subject, but an attempt to raise questions about our knowledge and its extent presupposes questions about ideas. Without knowledge ideas are impossible. "idea" is thus a leading term in the Essay. It is used in a way peculiar to Locke. He means an abstract mental object of the understanding when a man thinks "or" whatever it is which the mind can be employed about. But ideas themselves are, he reminds us, "neither true nor false, being nothing but bare appearances." Phenomena as we might call them. Truth and falsehood, knowledge and error, good and bad, are all dependent on other things or on continuing connections between us and our interpretations of our ideas according to their mutual relations.

That none of our ideas are "innate" is the argument contained in the first book. This means that the human mind, before any ideas are present to it, is a blank slate; and needs the input of experience, quickening of ideas to become intellectually alive. The inward purpose of this famous argument is apt to be overlooked. It has been criticized as if it was a speculative controversy by Locke and his detractors. Locke and his followers, having recognized the need for categories of the understanding and presuppositions of reason in the constitution of knowledge.

"innate" Lord Shaftesbury says, "is a word Mr. Locke poorly plays on. For the fact, or rather the time of an idea is not in the mind, but whether the constitution of man be such that, being adult and grown up, the ideas of order and administration of a God will not infallibly and necessarily spring up in him." This Locke himself sometimes seems to allow. That there are cases in which we have found mind thinking, we find him saying, "which, though the soul from the beginning, or when a man is born, does not know, yet, by assistance from the outward senses, and the help of some previous cultivation, "is brought to some degree of a gradual and gradual increase beyond what I have affirmed in my first book. ("Epistle to Reader," in second edition). And much of our knowledge, as he shows in the fourth book, is rational insight, immediate or else demonstrable, and thus becomes "innate.

What Locke really objects to is, that any of our supposed knowledge should claim immunity from free criticism. He argues in the first book against the innateness of our knowledge of God and of morality. Locke's essay on the "thoughts and ideas" of the human mind, is demonstrable, being supported by causal necessity, without which there can be no knowledge; and he also maintains that morality as well as mathematics is demonstrable. The positions are not inconvertible or indemonstrable. Man, conscious of himself, born or innate, or conscious from our birth, may lie latent or subconscious in the individual mind; but for all that, when we gradually become more awake intellectually, such truths are seen to carry their own evidence with them.

Even in the first book he appeals to the common reason, which he calls "common sense." He would be thought void of common sense who asked, on the one side, or, on the other, went to give a reason, why it is impossible for the same thing to be and not to be. It carries its own light and evidence with it, and needs no other proof: he that understands the terms assents to it for its own sake, or else nothing else will ever be able to prevail with him to do it. (bk. i. chap. 3. § 4).

The truth is that neither Locke, nor any one hand, nor the intellects of the 17th century, could so express them, or, expressed their meaning with enough of precision; if they had, Locke's argument would probably have taken a form less open to the charge of mere empiricism. Locke believed that in attacking "innate principles," he was challenging the whole system of metaphysics, philosophy, and theology that rested on authority, and was thus, as he says, not "pulling up the foundations of knowledge," but "laying those foundations surer." When men heard that there were propositions that could not be doubted, it was not that they proposed to treat them as if they were not capable of proof; the judges are "innate" certainties, and therefore must be accepted unconditionally. This "eased the pain from the flames of search, stopped the inquiry of the doubtful, concerning all that was once called the "divinity," and the "supernatural," and put us to be masters and teachers to make this the principle of principles—that principles must not be questioned. The assumption that they were "innate" was enough to take men off the use of their own reasoning. Locke may, perhaps, have meant, "experience." Otherwise, what we take to be ideas are only empty words. Here the important point is what human "experience" involves. Locke says that our "ideas all come, and are the source, of our knowledge," i.e., our ideas of the externals of the world. Other books show to what extent those concerned with the Infinite depend on one or other of these two sources: our "complex ideas" are all made up of "simple ideas," either from without or from within. Locke's knowledge of the theories of the next six chapters of the second book, goes to show in detail that even those ideas which are most abstract, as remote soever they may seem from original data of outward sense, or of inner consciousness, are to be explained by "reasoning and joining together simple ideas" that it had at first, either from perceiving objects of sense, or from reflection upon its own operations.

To prove this, our thoughts of space, time, infinity, power, subordination, personal identity, causality, and others which seem most remote from the supposed original are examined in a "plain historical method," and shown to depend either on (a) perception of things external, through the five external senses, or (b) reflection upon operations of mind. Reflection, "though it be not sense, as having nothing to do with external objects," is yet, he says, "very like it, and might properly enough be called internal sense. But the suggestion that "sense" might designate both the springs of the idea and the idea, is not Locke's. He tacitly credits "reflection" with the ambiguity of his language makes opposite interpretations of this cardinal part of the Essay possible; the best we can do is to compare one part with another, and the effect this can have upon the whole. Although the second book is a sort of inventory of our ideas, as distinguished from the certainty and boundaries of our knowledge, Locke even here makes the assumption that the "simple ideas" of the externals are pricked from the preceding books without us, and that the mental "operations" discovered by "reflection" are those of a person continuously existing. He thus relieved himself of the difficulty of having at the outset to explain how the immediate operations of sense and reflection are accepted as "qualities" of things and persons. He takes this as a fact.

Such, according to Locke, are the only simple ideas which can appear even in the sublimest human speculations. But the mind, he remarks, as in the previous book, is capable of elaborating them in numberless modes and relations; although it is not in the power of the most exalted wit or enlarged understanding to invent or frame any new simple idea, not taken in one or the other of the two in which we are told, and in which we are never conscious of anything about God is necessarily confined to them. For proof of this Locke would have had any one try to fancy a taste which had never affected his palate, or to frame the idea of a scent he had never felt, or an operation which had never given him pain. And to the extent that the contrast and correlation of these two data of experience is suggested in the chapter on the "qualities of matter" in which we are introduced to a noteworthy vein of speculation (bk. ii. chap. 6. § 11, "qualities of matter," looks like an interpolation in an analysis of "more ideas.") Locke here treats simple ideas of the five senses as qualities of outward things. And the sense data, he finds, partly (a) revelations of external things themselves in their mathematical relations, and partly (b) sensations, boundless in variety, which are somehow awakened in us through contact and collision with things relatively to their mathematical relations. Locke calls the former sort "primary, original or essential qualities..."
of matter, and the others "secondary or derived qualities." The primary qualities, which are equal, rather than qualities, are inseparable from matter and, virtually identical with it. On the other hand, there is nothing perceived in the mathematical relations of bodies or the least resembles secondary qualities. If there were no sentient beings in existence, the secondary qualities would disappear, as "the conditions of the common life of man are of a creature, not of the Deity." If the primary qualities were not homogeneous, "he would find himself in a difficulty like that of the Indian, who, after saying that the world rested on an elephant, and the elephant on a broad-backed tortoise, could only suppose the tortoise to be a constellation, the stars, or a great cloud. And it is not to conceive it is like the attempt positively to conceive immensity, and eternity; we are involved in an endless, ultimately incomprehensible, regress. We fail when we try either positively to phenomenize substance or disperse with the superphenomenal abstraction. Our only possible "solution" of the problem, he says, that we can approach a positive conception of God, namely by "enlarging indefinitely some of the simple ideas we received from reflection. Why man must remain in this mental predicament, Locke himself had no certain explanation, and he struggled bravely to be faithful to fact in his report of the state in which we find ourselves when we try to conceive continued personal identity. The paradoxes in which he here gets involved illustrate the confusion.

Locke's thoughts about Causality and Active Power are especially noteworthy, for he rests our knowledge of God and of the external universe on those ultimate ideas. The intellectual demand for the cause of an event is what we find we cannot help having, and it seems that we cannot fully grasp. Locke is content to trace the idea of "cause and effect" as far as mere natural science goes, to our "constant observation" that "qualities and finite substances begin to exist, and receive their primary impressions from matter without any causative action on their part, and that which described the connexion is what gives intelligibility to ceaseless and what seemed chaotic changes, converting them into the divinely concretized system which we call the universe." Locke seems hardly to have been aware of the scientific revolution of our time, and he can see only the "expectation of change. Anything, as far as "constant observation" tells us, has a priori been the natural cause of anything; and no finite number of observed sequences, per se, can guarantee universality. Failing the idea of power, or active causation, on the other hand, "is got," he says, "by the perception of sensible things, but by the direct connection of one phenomenon with another, as "through our consciousness of our own voluntary agency, and therefore through reflection" (bk. ii. ch. 21). In bodies we observe no active agency, only a sustained natural order in the succession of events, which is called "law of nature." Locke's material world must be analogous to what we are conscious of when we exert volition. Locke here unconsciously approaches the spiritual view of active power in the physical universe afterwards taken by Berkeley, forming the constructive principle of his philosophy.

Locke's book on Ideas leads naturally to his Third Book which is concerned with Words, or the sensible signs of ideas. Here he analyses "abstract ideas," and instructively illustrates how, for instance, he produced them by the inevitable imperfection of words. He unfolds the relations between verbal signs and the several sorts of ideas; words being the means for enabling us to treat ideas as typical, abstract and general.

Some parts of this third book, concerning Words, Locke tells his friend Leibniz, "are, as it were, mere patches, though, yet cost me more pains to express than all the rest of my Essay. And therefore I should not much wonder, if there be in some places of it obscurity and doubtfulness. But in the knowledge proper and Probability, closes the Essay. Knowledge, he says, is perception of relations among ideas; it is expressed in our affirmations and negations; and real knowledge is discernment of the ideas to what is real. The foregoing part of the Essay he had dealt with "ideas and simple apprehension," here he is concerned with intuitive "judgment and demonstrative "reasoning," also with judgments and reasons about matters of fact. At the end of this patient search among our rational conscious mind, Locke revised his theory, as he would have it in this while only building a castle in the air," and to ask what the purpose of all this is, if we are not thereby carried beyond mere ideas. "If it be true that knowledge lies only in the agreement of our ideas with things, and the perceptions or feelings of a sober man will be equally certain. It is no matter how they themselves are " (bk. iv. 4). This gives the keynote to the fourth book. It does not, however, carry him into a critical analysis of the rational constitution of knowledge, like Kant. Hume had not yet shown the difficulties attending the latter kind of reason when he accepted without criticism. The subtle agnostic, who doubted reason because reason could not be supported in the end by empirical evidence, was less in his view than persons blindly resting on authority or prejudice. "The narrower the question the more it is regarded as unworthy of the serious attention of a wise man.

"Where we perceive the agreement or disagreement of any of our ideas there is certain knowledge; and wherever we are sure these agree, or disagree with the reality of things, there is certain real knowledge " (bk. iv. ch. 4).

Locke's report about human knowledge and its narrow extent on the other hand, ends the first thirteen chapters of the fourth book. The remainder of the book is concerned for the most part with the probabilities on which he insists is a prudent folly, as is the Butler of fond
reminding us. As regards kinds of knowledge, he finds that "all knowledge we are capable of" must be assertion or denial of some one of these three sorts of relation among our ideas themselves, or else of relations between our ideas and reality that is to say, our ideas. Knowledge is concerned either with (a) relations of identity and difference among ideas, as when we say that "blue is not yellow"; or (b) with mathematical relations, as that "two and two make four"; or (c) in assertions that one quality does or does not coexist with another in the same substance, as that "iron is susceptible of malleability, or that ice is not hot"; or (d) with ontological reality, in the precise sense of actual existence, as "exists" or "I exist" or "the universe exists." The first sort is analytical; mathematical and ethical knowledge represents the second; physical science forms the third; real knowledge of self, God, the world, etc., the fourth.

Locke found important differences in the way in which knowledge of any sort is reached. In some instances the known relation is self-evident, as when we judge intuitively that a circle cannot be a square or an ellipse, that the sun sets in the west; in other cases the known relation is perceived to be intellectually necessary through the medium of premises, as in a mathematical demonstration. All that is strictly known is reached by the third sort of intuition by demonstration, which hardly deserves the name. For "our perceptions of the particular existence of finite beings without us go beyond mere probability, yet they are not purely rational. There is nothing in the nature of finite minds that prevents our conceiving the things external as illusions, although we are somehow unable to doubt them. We find ourselves inevitably "conscious of a different sort of perception," when we actually see the sun by day and when we cannot doubt its reality.

Locke next inquired into what extent knowledge—in the way either of intuitive certainty, demonstrative certainty, or sense-perception—is possible in regard to each of the four (already mentioned) sorts of knowledge. His method was inductive, since it never attempted to prove the existence of God, nor the immortality of the soul, or anything else about which there is no knowledge coextensive with our ideas. It is that "identity and diversity": we cannot be conscious at all without distinguishing, and every affirmation necessarily implies negation. The second sort of knowledge, demonstrative, is the principal one in which we are, at least in the present, absolutely discernible. Morality, Locke thinks, as well as mathematical quantity, is capable of being demonstrated. "Where there is no property there is no injustice," is an example of a proposition "as certain as any demonstration in Euclid." Only we are apt to be mistaken in our conclusions, we have never been able to prove anything about the moral questions of morality than in dealing with problems in mathematics.

Turning from abstract mathematical and moral relations to concrete relations of coexistence and succession among phenomena, the third sort of knowledge—Locke finds third sort of pure sense disappear: although these relations form "the greatest and most important part of what we desire to know." Of these, including as they do all inductive science, he reports that demonstrable knowledge is "very rare" and "primitive in its present condition, as the whole act of knowledge is by no means coextensive with our ideas."

For natural science depends, he thinks, on the knowledge of the relations between ideas only, and our knowledge of the relations between the phenomena of the mind is by no means absolutely demonstrable. Natural philosophy, he insists, does not pretend to know the nature of things, but to discover the laws by which they are governed. Locke is here expressing the opinion that the proper province of natural philosophy is to discover the laws of nature, and that the proper province of natural theology is to discover the laws of God's operations.
Reasonableness of Christianit relaxed has also gone through many editions, and has been translated into different languages.

The first collected edition of Locke's Works was in 1714, in three folio volumes. The best is that by Bishop Law, in four quarto volumes (1777).

The one most commonly used is the edition of 1812. The English edition by Jean le Clerc (Bibliothèque choisie, 1705) has been the basis of the memoirs of Locke prefixed to the successive editions of his Works, or contained in biographical dictionaries. In 1850 a Life of Locke (2nd ed. in two volumes, with considerable additions, 1855), was produced by Peter, 7th Baron King, a descendant of Locke's cousin, Anne Locke. This adds a good deal to what was previously known, as Lord King was able to draw from the mass of correspondence, journals and commonplace books of Locke in his possession. In the same year D. J. MacArthur's book, Some letters of John Locke, to Benjamin Furry, was published. The most copious account of the life is contained in the two volumes by H. R. Fox-Bourne (1876), the results of laborious research among the Shaftesbury Papers, Locke MSS. in the British Museum, the Public Record Office, the College of Surgeons, and the Remonstrants' library at Amsterdam. Monographs on Locke by T. H. Fowler in 1880, in English Men of Letters, and by Fraser, in 1890, in Blackwood's Philosophical Classics, may be mentioned; all addressed by Sir F. H. Bradley, a biographer of Locke's, at the bicentenary commemoration by the British Academy of Locke's death, published in the Proceedings of the Academy (1904). See also C. Bastide, Jean Locke; ses théories politiques et leur influence en Angleterre (Paris, 1907); H. Ollion, La Philosophie générale de J. L. (1906). (A. C. F.)

LOCKE, MATTHEW (c. 1635-1677), English musician, perhaps the earliest English writer for the stage, was born at Exeter, where he became a chorister in the cathedral. He was educated by John Stainer, the famous organist, and Charles II. During the following years he wrote a number of anthems for the Chapel Royal, and excited some criticism on the score of novelty, to which he replied with considerable heat (Modern Church Music; pre-accursed, censured and obtruded in its Performance before His Majesty, April 1st, 1666, &c.; copies in the Fitzwilliam Museum, Cambridge, and the Royal College of Music). A good deal of music for the theatre followed, the most important being for Davenant's productions of The Tempest (1667) and of Macbeth (1672), but some doubt as to this latter has arisen, Purcell, Eccles or Leveridge, being also credited with it. He also composed various songs and instrumental pieces, and published some curious works on musical theory. He died in August 1677, an elegy being written by Purcell.

LOCKERBIE, a municipal and police burgh of Dumfriesshire, Scotland, in the district of Annandale, 143 m. E.N.E. of Dumfries by the Caledonian railway. Pop. (1901) 2358. It has long been famous for its cattle and sheep sales, but more particularly for the great August lamb fair, the largest in Scotland, at which as many as 126,000 lambs have been sold. The town hall and Easton institute are in the Scottish Baronial style. The police station is partly accommodated in the ancient square tower, once the stronghold of the Lockers, for a long period the rulers of the little burgh. The protection the town gradually grew up. At Drye Sands, about 2 m. to the W., a bloody encounter took place in 1593 between the Johnstones and Maxwells. The Maxwell's were pursued into Lockerbie and almost exterminated;—here Lockerbie Luck became a proverbial expression, signifying an overwhelming defeat.

LOCKER-LAMPSON, FREDERICK (1821-1895), English man of letters, was born, on the 29th of May 1821, at Greenwich Hospital. His father, who was Civil Commissioner of the Hospital, was Edward Hawke Locker, youngest son of that Captain William Locker who gave Nelson the memorable advice "to lay a Frenchman close, and beat him." His mother, Eleanor Mary Elizabeth Boucher, was a daughter of the Rev. Jonathan Boucher, vicar of Epsom and friend of George Washington. After a desultory education, Frederick Locker began life in a colonial broker's office. Soon deserting this ungenial calling, he obtained a clerkship in Somerset House, whence he was transferred to Lord Haddington's private office at the Admiralty. Here he became deputy-reader and préféré writer. In 1850 he married Lady Charlotte Bruce, daughter of the Lord Elgin who brought the famous marbles to England, and sister of Lady Augusta Stanley. After his marriage he left the Civil Service, in consequence of ill-health. In 1857 he published London Lyrics, a slender volume of 90 pages, which, with subsequent editions, constitutes his poetical legacy. Lyra Elegantiarum (1867), an anthology of light and familiar verse, and Patchwork (1879), a book of extracts, were his only other publications. In 1872 Lady Charlotte Locker died. Two years later Locker married Miss Hannah Jane Lampson, the only daughter of Sir Curtis Miranda Lampson, Bart., of Rowfant, Sussex, and in 1883 took his wife's surname. At Rowfant he died on the 30th of May 1895. Chronic ill-health debarked Locker from any active part in life, but it did not prevent his delighting a wide circle of friends by his gifts as a host and raconteur, and from accumulating many treasures as a connoisseur. His books are catalogued in the volume called the Rowfant Library (1886), to which an appendix (1900) was added, after his death, under the superintendence of his eldest son. As a poet, Locker belongs to the school dealing with the gay rather than the grave in verse—with the polished and witty rather than the lofty or emotional. His taste kept him as far from the broadly comic on the one side as his kind heart saved him from the purely cynical on the other. To something of Prior, of Frael and of Hood he added qualities of his own, which lent his locker distinctly individualistic in no wise diminished by his unwearied endearment after directness and simplicity.

A posthumous volume of Memoirs, entitled My Confidences (1889), and edited by his son-in-law, Mr. Augustus Birkel, gives an interesting idea of his personality and a too modest estimate of his gifts as a poet.

LOCKHART, GEORGE (1672-1731), of Carnwath, Scottish writer and politician, was a member of a Lanarkshire family tracing descent from Sir Simon Locard (the name being originally territorial, de Loc Ard), who is said to have accompanied Sir James Douglas on his expedition to the East; with the heart of Bruce, which relic, according to Froissart, Locard brought home from Spain when Douglas fell in battle against the Moors, and buried in Melrose Abbey; this incident was the origin of the "man's heart within a fetterlock" borne on the Lockhart shield, which in turn perhaps led to the altered spelling of the surname. George Lockhart's grandfather was Sir James Lockhart of Lee (d. 1674), a lord of the court of session with the title of Lord Lee, who commanded a regiment at the battle of Preston. Lord Lee's eldest son, Sir William Lockhart of Lee (1621-1675), after fighting on the king's side in the Civil War, attached himself to Oliver Cromwell, whose niece he married, and by whom he was appointed commissioner for the administration of justice in Scotland in 1652, and English ambassador at the French court in 1656, where he greatly distinguished himself by his successful diplomacy. Lord Lee's second son, Sir George Lockhart (c. 1630-1689), was lord-advocate in Cromwell's time, and was celebrated for his persuasive eloquence; in 1674, when he was disbarred for alleged disrespect to the court of session in advising an appeal to parliament, fifty barristers showed their sympathy for him by withdrawing from practice. Lockhart was readmitted in 1676, and became the leading advocate in political trials, in which he usually appeared for the defence. He was appointed lord-president of the court of session in 1685; and was shot in the streets of Edinburgh on the 31st of March 1689 by John Chiesley, against whom the lord-president had adjudicated a cause. Sir George Lockhart purchased the extensive estates of the earls of Carnwath in Lanarkshire, which were inherited by his eldest son, George, whose mother was Philadelphia, daughter of Lord Wharton.

George Lockhart, who was member for the city of Edinburgh in the Scottish parliament, was appointed commissioner for arranging the union with England in 1705. After the union he continued to represent Edinburgh, and later the Wigtown burghs. His sympathies were with the Jacobites, whom he kept informed of all the negotiations for the union; in 1713 he took part in an abortive movement aiming at the repeal of the union. He was deeply implicated in the rising of 1715, the preparations for which he assisted at Carnwath, and at Dryden,
his Edinburgh residence. He was imprisoned in Edinburgh castle, but probably, through the favour of the duke of Argyll, he was released without being brought to trial; but his brother Philip was taken prisoner at the battle of Preston and condemned to be shot, the sentence being executed on the 2nd of December 1715. After his liberation Lockhart became a secret agent of the Pretender; but his correspondence with the prince fell into the hands of the government in 1727, compelling him to go into concealment at Durham until he was able to escape abroad. Argyll's influence was again exerted in Lockhart's behalf, and in 1728 he was permitted to return to Scotland, where he lived in retirement till his death in a duel on the 17th of December 1731. Lockhart was the author of Memoirs of the Affairs of Scotland, dealing with the reign of Queen Anne till the union with England first published in 1714; These Memoirs, together with Lockhart's correspondence with the Pretender, and one or two papers of minor importance, were published in two volumes in 1817, forming the well-known "Lockhart Papers," which are a valuable authority for the history of the Jacobites.

Lockhart married Eupheme Montgomerie, daughter of Alexander, 4th earl of Eglinton, by whom he had a large family. His grandson James, who assumed his mother's name of Wishart in addition to that of Lockhart, was in the Austrian service during the Seven Years' War, and was created a baron and count of the Holy Roman Empire. He succeeded to the estates of Lee as well as of Carnwath, both of which properties passed, on the death of his son Charles without issue in 1802, to his nephew Alexander, who was created a baronet in 1806.

See The Lockhart Papers (2 vols., London, 1871); Andrew Lang, History of Scotland (4 vols., London, 1900). For the story of Sir Simon Lockhart's adventures with the heart of the Bruce, see Sir Walter Scott's The Talisman.

**LOCKHART, JOHN GIBSON (1794-1854).** Scottish writer and editor, was born on the 14th of July 1794 in the manse of Cambusnethan in Lanarkshire, where his father, Dr John Lockhart, transferred in 1796 to Glasgow, was minister. His mother, who was the daughter of the Rev. John Gibson, of Edinburgh, was a woman of considerable intellectual gifts. He was sent to the Glasgow high school, where he showed himself clever rather than industrious. He fell into ill-health, and had to be removed from school before he was twelve; but on his recovery he was sent at this early age to Glasgow University, and displayed so much precocious learning; especially in Greek, that he was offered a scholarship at St Andrew's. He was not fourteen when he entered Balliol College, where he acquired a store of knowledge outside the regular curriculum. He read French, Italian, German and Spanish, was interested in classical and British antiquities, and became versed in heraldic and genealogical lore. In 1813 he took a first class in classics in the final schools. For two years after leaving Oxford he lived chiefly in Glasgow before settling to the study of Scottish law in Edinburgh, where he was called to the bar in 1816. A tour on the continent in 1817, when he visited Goethe at Weimar, was made possible by the kindness of the publisher Blackwood, who advanced money for a promised translation of Schlegel's Lectures on the History of Literature, which was not published until 1838. Edinburgh was then the stronghold of the Whig party, whose organ was the Edinburgh Review, and it was not till 1817 that the Scottish Tories found a means of expression in Blackwood's Magazine. After a somewhat hum-drum opening, Blackwood suddenly electrified the Edinburgh world by an outburst of brilliant criticism. John Wilson (Christopher North) and Lockhart had joined its staff in 1817. Lockhart no doubt took his share in the caustic and aggressive articles which marked the early years of Blackwood; but his biographer, Mr Andrew Lang, brings evidence to show that he was not responsible for the virulent articles on Coleridge and on "The Cockney School of Poetry," that is on Leigh Hunt, Keats and their friends. He has been persistently accused of the later Blackwood article (August 1818) on Keats, but he showed at any rate a real appreciation of Coleridge and Wordsworth. He contributed to Blackwood many spirited translations of Spanish ballads, which in 1823 were published separately. In 1818 the brilliant and handsome young man attracted the notice of Sir Walter Scott, and the acquaintance soon ripened into an intimacy which resulted in a marriage between Lockhart and Scott's eldest daughter Sophia, in April 1820. Five years of domestic happiness followed, with winters spent in Edinburgh and summers at a cottage at Chiefwood, near Abbotsford, where Lockhart's two eldest children, John Hugh and Charlotte, were born; a second son, Walter, was born later at Brighton. In 1820 John Scott, the editor of the London Magazine, wrote a series of articles attacking the conduct of Blackwood's Magazine, and making Lockhart chiefly responsible for its extravagances. A correspondence followed, in which a meeting between Lockhart and John Scott was proposed, with Jonathan Henry Christie and Horace Smith. Six months later, a series of delays and complicated negotiations resulted early in 1821 in a duel between Christie and John Scott, in which Scott was killed. This unhappy affair, which has been the subject of much misrepresentation, is fully discussed in Mr Lang's book on Lockhart.

Between 1818 and 1825 Lockhart worked indefatigably. In 1819 Peter's Letters to his Kinsfolk appeared, and in 1822 he edited Peter Motteux's edition of Don Quixote, to which he prefixed a life of Cervantes. Four novels followed: Valerius in 1821, Some Passages in the Life of Adam Blair, Minister of Gospel at Cross Meikle in 1822, Reginald Dollon in 1823 and Matthew Wald in 1824. But his strength did not lie in novel writing, although the vigorous quality of Adam Blair has been recognized by modern critics. In 1825 Lockhart accepted the editorship of the Quarterly Review, which had been in the hands of Sir John Taylor Coleridge since Gifford's resignation in 1824. He had now established his literary position, and, as the next heir to his unmarrried half-brother's property in Scotland, Milton Lockhart, he was sufficiently independent, though he had abandoned the legal profession. In London he had great social success, and was recognized as a brilliant editor. He contributed largely to the Quarterly Review himself, his biographical articles being especially admirable. He showed the old railing spirit in an amusing but violent article in the Quarterly on Tennyson's Poems of 1833, in which he failed to discover the mark of genius. He continued to write for Blackwood; he produced for Constable's Miscellany in 1828 what remains the most charming of the biographies of Burns; and he undertook the superintendence of the series called "Murray's Family Library," which he opened in 1828 with a History of Napoleon. But his chief work was the Life of Sir Walter Scott (2 vols., 1837-1838; ed. and corrected, 1839). There were not wanting those in Scotland who taxed Lockhart with ungenerous exposure of his subject, but to most healthy minds the impression conveyed by the biography was, and is, quite the opposite. Carlyle did justice to many of its excellencies in a criticism contributed to the London and Westminster Review (1837). Lockhart's account of the transactions between Scott and the Ballantynes and Constable caused great outcry; and in the discussion that followed he showed unfortunate bitterness by his pamphlet, "The Ballantyne Humbug handled." The Life of Scott has been called, after Boswell's Johnson, the most admirable biography in the English language. The proceeds, which were considerable, Lockhart resigned for the benefit of Scott's creditors.

The close of Lockhart's life was saddened by family bereavement, resulting in his own breakdown in health and spirits. His eldest boy (the suffering "Hugh Littlejohn" of Scott's Tales of a Grandfather) died in 1821; Scott himself in 1832; Mrs Lockhart in 1837; and the surviving son, Walter Lockhart, in 1832. Resigning the editorship of the Quarterly Review in 1833, he spent the next winter in Rome, but returned to England without recovering his health; and being taken to Abbotsford by his daughter Charlotte, who had become Mrs James Robert Hope-Scott, he died there on the 23rd of November 1854. He was buried in Dryburgh Abbey, near Sir Walter Scott.

Lockhart's Life (2 vols., London and New York, 1897) was written by Andrew Lang. A. W. Pollard's edition of the Life of Scott (1900) is the best.
LOCKHART, SIR WILLIAM STEPHEN ALEXANDER (1841–1900), British general, was born in Scotland on 2nd September 1841, his father being a Lanarkshire clergyman. He entered the Indian army in 1858, in the Bengal native infantry. He served in the Indian Mutiny, the Bhutan campaign (1864–66), the Abyssinian expedition (1867–68; mentioned in despatches), the Hazara Black Mountain expedition (1868–69; mentioned in despatches). From 1869 to 1876, he acted as deputy-assistant and assistant quartermaster-general in Bengal. In 1877, he was military attaché with the Dutch army in Acheen. He served in the Afghan War of 1878–80, was mentioned in despatches and made a C.B., and from 1880 to 1885 was D.Q.G. in the intelligence branch at headquarters. He commanded a brigade in the Third Burmese War (1886–87), and was made K.C.B., C.S.I., and received the thanks of the government. An attack of fever brought him to England, where he was employed as assistant military secretary for Indian affairs; but in 1890 he returned to India to take command of the Punjab frontier force, and for five years was engaged in various expeditions against the hill tribes. After the Waziristan campaign in 1894–95, he was made K.C.S.I. He became full general in 1896, and in 1897 he was given the command against the Afghans and Mohmands, and conducted the difficult Tirah campaign with great skill. He was made G.C.B., and in 1898 became commander-in-chief in India. He died on the 18th of March 1900. Sir William Lockhart was not only a first-rate soldier, but also had a great gift for dealing with the native tribesmen. Among the latter he had the sobriquet of Amir Sahib, on account of their respect and affection for him.

LOCK HAVEN, a city and the county-seat of Clinton county, Pennsylvania, U.S.A., on the west branch of the Susquehanna river, near the mouth of Bald Eagle Creek, about 70 m. N.W. of Harrisburg. Pop. (1900) 2710 (618 foreign-born and 122 negroes); (1910) 7772. It is served by branches of the Pennsylvania and the New York Central and Hudson River railroads and by electric interurban railroads. The city is pleasantly situated in an agricultural region, and there are large deposits of cement and of fire-brick clay in the vicinity. Lock Haven is the seat of the Central State Normal School (open 1877), and has a public library and a hospital. There are various manufactures. The municipality owns and operates the water-works. The locality was settled in 1769. A town was founded in 1833, the Pennsylvania Canal (no longer in use here) was completed to this point in 1834, and the name of the place was suggested by two canal locks and the harbour, or haven, for rafts in the river. Lock Haven was made the county-seat immediately after the election of Clinton county in 1839, was incorporated as a borough in 1840, and first chartered as a city in 1870.

LOCKPORT, a city of Will county, Illinois, U.S.A., on the Des Plaines river and the Illinois & Michigan Canal, and the terminus of the Chicago Sanitary District Drainage Canal, about 33 m. S.W. of Chicago and 4 m. N.W. of Joliet. Pop. (1900) 2639 (1552 being foreign-born and 330 negroes); (1910) 2572. Lockport is served by the Chicago & Alton, and the Atchison, Topeka & Santa Fé railways, and by the Chicago & Joliet Electric railway. It is in a picturesque farming country, and there are good limestone quarries in the valley of the Des Plaines river. It has manufactures and a considerable trade, especially in grain. A settlement was made here about 1827; in 1837 the site was chosen as headquarters for the Illinois & Michigan Canal and a village was laid out; it was incorporated in 1853, and was chartered as a city in 1894. In 1892 work was begun on the Chicago Drainage Canal, whose controlling works are here and whose plant, developing 40,000 h.p. from the 40 ft. fall between Joliet and Lockport, supplies Lockport with cheap power and has made it a manufacturing rather than a commercial city.

LOCKROY, a city and the county-seat of Niagara county, New York, U.S.A., on the Erie Canal, 26 m. by rail by N. E. of Buffalo and 36 m. W. of Rochester. Pop. (1900) 16,581, of whom 2936 were foreign-born and 160 were negroes; (1910 census) 17,970. It is served by the New York Central & Hudson River and the Erie railways, by the International railway (electric interurban), and by the Erie Canal. The city owes its name to the five double locks of the canal, which here falls 66 ft. (over a continuation of the Niagara escarpment locally known as "Mountain Ridge") from the level of Lake Erie to that of the Genesee river. In 1899 a scheme was on foot to replace these five locks by a huge lift lock and to construct a large harbour immediately W. of the city. The surplus water from Tonawanda Creek, long claimed both by the Canal and by the Lockport manufacturers, after supplying the canal furnishes water-power, and electric power is derived from Niagara. The factory products, mostly paper and wood-pulp, flour and cereal foods, and foundry and machine-shop products, were valued in 1905 at $5,007,900. Lockport lies in a rich farming and fruit (especially apple and pear) country, containing extensive sandstone and Niagara limestone quarries, and is a shipping point for the fruits and grains and the limestone and sandstone of the surrounding country. Many buildings in the business part of the city are heated by the Holly distributing system, which pipes steam from a central station or plant, and originated in Lockport.

The city owns and operates the water-works, long operated under the Holland system, which, as well as the Holly distributing system, was devised by Birdshell Holly, a civil engineer of Lockport. In 1900 a new system was virtually completed, water being taken from the Niagara river at Tonawanda and pumped thence to a stand-pipe in Lockport.

The site, that of the most easterly village in New York state held by the Neutral Nation of Indians, was part of the tract bought by the Holland Company in 1792–1793. Subsequently most of the land on which the city stands was bought from the Holland Company by Esek Brown, the proprietor of a local tavern, and fourteen others, but there were few settlers until after 1820. In 1822 the place was made the county-seat, and in 1823 it was much enlarged by the settlement here of workmen on the Erie Canal, and was the headquarters for a time of the canal contractors. It was incorporated as a village in 1830, was reached by the Erie railway in 1832, and in 1865 was chartered as a city.

LOCKROY, ÉDOUARD (1838– ), French politician, son of Joseph Philippe Simon (1803–1891), an actor and dramatist who took the name of Lockroy, was born in Paris on the 18th of July 1838. He had begun by studying art, but in 1860 enlisted as a volunteer under Garibaldi. The next three years were spent in Syria as secretary to Ernest Renan, and on his return to Paris he embarked in militant journalism against the second empire in the Figaro, the Diable à quatre, and eventually in the Roppel, with which his name was thenceforward intimately connected. He commanded a battalion during the siege of Paris, and in February 1871 was elected deputy to the National Assembly where he sat on the extreme left and protested against the preliminaries of peace. In March he signed the proclamation for the election of the Commune, and resigned his seat as deputy. Arrested at Vanves he remained a prisoner at Versailles and Chartres until June when he was released without being tried. He was more than once imprisoned for violent articles in the press, and in 1873 for a duel with Paul de Cassagne. He was returned to the Chamber in 1873 as Radical deputy for Bouches-du-Rhône in 1876, 1877 and 1881 for Aix, and in 1881 he was also returned in the 14th arrondissement of Paris. He elected to sit for Paris and was again re-elected. During the elections of 1883 he was shot at by a cab-driver poet named Moore, but was not seriously injured. For the first ten years of his parliamentary life he voted consistently with the extreme left, but then adopted a more opportunist policy, and gave his unreserved support to the Brisson ministry of 1885. In the new Freycinet cabinet formed in January he held the portfolio of commerce and industry, which he retained in the Goblet ministry of 1886–1887. In 1885 he had been returned at the head of the poll for Paris, and his inclusion in the Freycinet ministry was taken to indicate a prospect of reconciliation between Parisian Radicalism and official Republicanism. During his tenure of the portfolio of commerce and industry he made the preliminary arrangements for the Exposition of 1889, and in a witty letter
he defended the erection of the Tour Eiffel against artistic Paris. After the Panama and Boulangist scandals he became one of the leading politicians of the Radical party. He was vice-president of the Chamber in 1894 and in 1895, when he became minister of marine under Léon Bourgeois. His drastic measures of reform alarmed moderate politicians, but he had the confidence of the country, and held the same portfolio under Henri Brisson (1889) and Charles Dupuy (1889–1890). He gave his support to the Waldeck-Rousseau Administration, but actively criticized the marine policy of Camille Pelletan in the Combes ministry of 1902–1902, during which period he was again vice-president of the Chamber. M. Lockyer was a persistent and successful advocate of a strong naval policy, in defence of which he published La Marine de Guerre (1890), Six mois rue Royale (1897), La Défense navale (1900), Du Weser à la Vistule (1901), Les Marines française et allemande (1904), Le Programme naval (1906). His other works include M. de Malte et la guerre future (1891) and Journal d'une bourgeoise pendant la Révolution (1881) derived from the letters of his great-grandmother. M. Lockyer married in 1877 Madame Charles Hugo, the daughter-in-law of the poet.

**LOCKWOOD, SIR FRANK** (1846–1897), English lawyer, was born at Doncaster. His grandfather and great-grandfather were mayors of Doncaster, and the former for some years filled the office of judge on the racecourse. He was educated at a private school, at Manchester grammar school, and Caius College, Cambridge. Called to the bar at Lincoln’s Inn in 1872, he joined the old midland circuit, afterwards going to the north-eastern, making in his first year 120 guineas and in the next 263 guineas. From that time he had a career of uninterrupted success. In 1882 he was made a queen’s counsel, in 1884 he was made recorder of Sheffield, and in 1894 he became solicitor-general in Lord Rosebery’s ministry, and was knighted, having first entered parliament as Liberal member for York in 1885, after two unsuccessful attempts, the one at King’s Lynn in 1886, the other at York in 1883. He was solicitor-general for less than a year. In 1896 Lord Chief Justice Coleridge, Mr Montague Crackanthorpe and Sir Frank Lockwood went to the United States to attend, as specially invited representatives of the English bar, the nineteenth meeting of the American Bar Association. On this trip Sir Frank Lockwood sustained the reputation which he enjoyed in England as a humorous after-dinner speaker, and helped to strengthen the bond of friendship which unites the bench and bar of the United States with the bench and bar of England. He died in London on the 18th of December 1897. Lockwood had considerable talent for drawing, inherited from his father, which he employed, chiefly for the amusement of himself and his friends, in the making of admirable caricatures in pen and ink, and of sketches of humorous incidents, real or imaginary, relating to the topic nearest at hand. An exhibition of them was held soon after his death.

See Augustine Birrell’s biography of Lockwood and The Frank Lockwood Sketch-Book (1898).

**LOCKWOOD, WILTON** (1861–), American artist, was born at Wilton, Connecticut, on the 12th of September 1861. He was a pupil and an assistant of John La Farge, and also studied in Paris, becoming a well-known portrait and figure painter. He became a member of the Society of American Artists (1868), and of the Copley Society, Boston, and an associate of the National Academy of Design, New York.

**LOCKYER, SIR JOSEPH NORMAN** (1836–), English astronomer, was born at Rugby on the 17th of May 1836. After completing his education on the Continent of Europe, he obtained a clerkship in the War Office in 1857. His leisure was devoted to the study of astronomy, and he was appointed in 1870 secretary to the duke of Devonshire’s royal commission on science. In 1875 he was transferred to the Science and Art Department at South Kensington, and on the foundation of the Royal College of Science he became director of the solar physics observatory and professor of astronomical physics. Eight British government expeditions for observing total solar eclipses were conducted by him between 1870 and 1905. On the 26th of October 1868 he communicated to the Paris Academy of Sciences, almost simultaneously with Dr P. J. C. Janssen, a spectroscopic method for observing the solar prominences in daylight, and the names of both astronomers appear on a medal which was struck by the French government in 1872 to commemorate the discovery. Lockyer was elected a fellow of the Royal Society in 1869, and received the Rumford medal in 1874. He initiated in 1866 the spectroscopic observation of sunspots; applied Doppler’s principle in 1869 to determine the radial velocities of the chromospheric gases; and successfully investigated the chemistry of the sun from 1872 onward. Besides numerous contributions to the Proceedings of the Royal and the Royal Astronomical Societies, he published several books, both explanatory and speculative. The Chemistry of the Sun (1887) is an elaborate treatise on solar spectroscopy based on the hypothesis of elemental dissociation through the intensity of solar heat. The Meteoric Hypothesis (1890) propounds a comprehensive scheme of comical evolution, which has evoked more dissent than approval, while the Sun’s Place in Nature (1897) lays down the lines of a classification of the stars, depending upon their supposed temperature-rela- tions, among Lockyer’s chief works are—The Days of Astronomy (1894), in which Stonehenge and other British Stone Monuments astronomically considered (1906) may be considered a sequel; Recenti e coming Eclipses (1897); and Inorganic Evolution (1900). He was created K.C.B. in 1897, and acted as president of the British Association in 1903–1904. His fifth son, **WILLIAM JAMES STEWART LOCKYER** (b. 1868), devoted himself to solar research, and became chief assistant in the Solar Physics Observatory, South Kensington.

**LOCLE, LE**, a town in the Swiss canton of Neuchâtel, 24 m. by rail N. of Neuchâtel, and 5 m. S.W. of La Chaux de Fonds. It is built (3035 ft. above the sea-level) on the Bied stream in a valley of the Jura, and is about 1 m. from the French frontier. In 1681 Daniel Jean Richard introduced watch-making here, which soon drove out all other industries. In 1900 the population was 12,539, mainly Protestants and French-speaking. The church tower dates from 1521, but the old town was destroyed by fire in 1833. The valley in which the town is situated used to be subject to inundations, but in 1864 a tunnel was constructed by means of which the surplus waters of the Bied are carried into the Doubs. About 1 m. W. of the town the Bied plunged into a deep chasm, on the steep rock face of which were formerly the subterranean mills of the Col des Roches, situated one above another; but the stream is now diverted by the above-mentioned tunnel, while another serves the railway line from Le Locle to Mortau in France (8 m.).

**LOCMARIAQUER**, a village of western France, on the W. shore of the Gulf of Morbihan, in the department of Morbihan, 83 m. S. of Auray by road. Pop. (1906) 756. Locmariaquer has a small port, and oyster culture is carried on close to it. Roman remains are to be seen, but the place owes its celebrity to the megalithic monuments in the vicinity, some of which are among the largest extant. The menhir of Men-er-H’roc (Fairy stone), which was broken into four pieces by lighting in the 18th century, previously measured about 67 ft. in height, and from 9 to 13 ft. in thickness.

**LOCOMOTOR ATAXIA** (G. & priv., and τάξις, order; synonyms. **Talas dorsalis, posterior spinal syneresis**), a progressive degeneration of the nervous system, involving the posterior columns of the spinal cord with other structures, and causing muscular incoordination and disorder of gait and station. The essential symptoms of the disease—stamping gait, and swaying with the eyes shut, the occurrence of blindness and of small fixed pupils—were recognized by Romberg (1831), but it was the clinical genius of Duchenne and his masterly description of the symptoms which led to its acceptance as a definite disease (1858), and he named it locomotor ataxia after its most striking symptom. In 1866 Argyll Robertson discovered that the eye-pupil is inactive to light but acts upon accommodation in the great majority of cases. This most important sign is named the “Argyll Robertson pupil.” With an ever-increasing knowledge of the widespread character of this disease and its manifold variations
in the complex of symptoms, the tendency among neurologists is to revert to the term employed by Romberg—
*tabes dorsalis*. "Locomotor ataxia," although it expresses a very characteristic feature of the disease, has this objection: it is a symptom which does not occur in the (preataxic) stage of the disease; indeed a great number of years may elapse before ataxy comes on, and sometimes the patient, after suffering a very long time from the disease, may die from some intercurrent complication, having never been ataxic.

It is generally recognized by neurologists that persons who are not the subjects of acquired or hereditary syphilis do not suffer from this disease; and the average time of onset after infection is ten years (see Neuropathology). There are three stages: (1) The preataxic, (2) the ataxic, (3) the bed-ridden paralytic. The duration of the first stage may be from one or two years, up to twenty years or even longer. In this stage various symptoms may arise. The patient usually complains of shooting, lightning-like pains in the legs, which may attribute to rheumatism. If a physician examines him, he will almost certainly find the knee-jerks absent and Argyll Robertson pupils present; probably on inquiry he will ascertain that the patient has had some difficulty in starting urination, or that he is unable to retain his water or to empty his bladder completely. In other cases, temporary or permanent paralysis of one or more muscles of the eyeball which causes squint and double vision, a failure of sight ending in blindness, attacks of vomiting or gastric crises, painless spontaneous fractures of bones and dislocations of joints, failing sexual power and impotence, may lead the patient to consult a physician, when this disease will be diagnosed, although the patient may not as yet have had locomotor ataxia. All cases, however, if they live long enough, pass into the second ataxic stage. The sufferer complains now of difficulty in walking in the dark; he sways with his eyes shut and feels as if he would fall (Romberg's symptom); he has the sensation of walking on wool, numbness and formation of the skin, and many sensory disturbances in the form of partial or complete loss of sensibility to pain, touch and temperature. These disturbances affect especially the feet and legs, and around the trunk at the level of the fourth to the seventh ribs, giving rise to a "girdle sensation." There may be a numbness feeling on the inner side of the arm, and muscular incoordination may affect the upper limbs as well as the lower, although there is no wasting or any electrical change. The atactic gait is very characteristic, owing to the loss of reflex tonus in the muscles, and the absence of guiding sensations from all the deep structures of the limbs, muscles, joints, bones, tendons and ligaments, as well as from the skin of the soles of the feet; therefore the sufferer has to be guided by vision as to where and how to place his feet. This necessitates the bending forward of the body, extension of the knees and broadening of the basis of support; he generally uses a walking stick or even two, and he jerks the leg forward as if he were on wires, bringing the sole of the foot down on the ground with a wide stride. The arm may be affected. The sufferer takes the tip of his nose with the eyes shut. Sooner or later he passes into the third bed-ridden stage, with muscles wasted and their tonus so much lost that he is in a perfectly helpless condition.

The complications which may arise in this disease are intercurrent affections due to septic conditions of the bladder, bedsores, pneumonia, vascular and heart affections. About 10% of the cases, at least, develop general paralysis of the insane. This is not surprising seeing that it is due to the same cause, and the etiology of the two diseases is as to lead many neurologists to consider them one and the same disease affecting different parts of the nervous system. *Tabes dorsalis* occurs with far greater frequency in men than in women (see Neuropathology).

The avoidance of all stress of the nervous system, whether physical, emotional or intellectual, is indicated, and a simple regular life, without stimulants or indulgence of the sexual passion, is the best means of delaying the progress of the disease. Great attention should be paid to micturition, so as to avoid retention and infection of the bladder. Drugs, even anti-syphilitic remedies, appear to have but little influence upon the course of the disease.

**LOCO-WEEDE**, or **CRAZY-WEEDE**, leguminous plants, chiefly species of *Astragalus* and *Lupinus*, which produce a disease in cattle known as "loco-disease." The name is apparently taken from the Spanish *loco*, mad. The disease affects the nervous system of the animals eating the plants, and is accompanied by exhaustion and wasting.

**LOCRI**, a people of ancient Greece, inhabiting two distinct districts, one extending from the north-east of Paros to the northern half of the Euboean channel, between Boeotia and Malis, the other south-west of Paros, on the north shore of the Corinthian Gulf, between Phocis and Aetolia. The former were divided into the northern Locri Epicenemidian, situated on the spurs of Mount Cenmis, and the southern Locri Opuntii, so named from their chief town Opus (q.v.); and the name Opuntia is often applied to the whole of this easterly district. Homer mentions only these eastern Locrians: their national hero in the Trojan War is Ajax Oileus, who often appears afterwards on Locrian coins. From Hesiod's time onwards, the Opuntians were thought by some to be of "Lelegian" origin (see LELEGES), but they were Hellenized early (though matriarchal customs survived among them)—and Deucalion, the father of Hellen himself, is described as the first king of Opus. The westerly Locri "in Ozolae" on the Corinthian Gulf, a rude and barbarous people, make no appearance in Greek history till the Peloponnesian War. It was believed that they had separated from the eastern Locrians four generations before the Trojan War; yet Homer has no hint of their existence. Probably the Locrians were once a single people, extending from sea to sea, till subsequent immigrations forced them apart into two separate districts. The Locrian dialect of Greek is little known, but resembles that of Elis: it has στ for σθ; uses αι, and has or in dat. plur. 3rd decl. A colony of Locrians (whether from Opus or Ozolae) was founded in and near the end of the 8th century B.C., at the south-west extremity of Italy. They are often called Locri Epizephyrii from Cape Zephyrion 15 m. S. of the city. Their founder's name was Euanthes. Their social organization resembled that of the Opuntian Locri, and like them they venerated Ajax Oileus and Persephone. Aristotle (ap. Polyb. xii. 5 sqq.) records a tradition that these Western Locrians were base-born, like the Parthenians of Tarentum; but this was disputed by his contemporary Timaeus. See Locri (town) below. (J. L. M.)

**LOCRI**, an ancient city of Magna Gracia, Italy. The original settlers took possession of the Zephyrian promontory (Capo Bruzzone some 17 m. N. of Capo Spartivento), and though after three or four years they transplanted themselves to a site 12 m. farther north, still near the coast, 2 m. S. of Gerace Marina below the modern Gerace, they still retained the name of Locri Epizephyrii (Apoll. of Eryc.) which served to distinguish them from the Ozolae or Opuntian Locri of Greece itself (see preceding article). The foundation of Locri goes back to about 683 B.C. It was the first of all Greek communities to have a written code of laws given by Zaleucus in 664 B.C. From Locri were founded the colonies of Messina and Himiponium (Hipponium). It succeeded in repelling the attacks of Croton (battle on the river Sagras, perhaps sometime in the 6th century), and found in Syracuse a support against Rhegium: it was thus an active adversary or Athenian appendage in the west. Pindar extolls its uprightness and love of the heroic muse of beauty, of wisdom, and of war, in the 9th and 11th Olympian Odes. Steichosiris (q.v.) was indeed of Locrian origin. But it owed its greatest external prosperity to the fact that Dionysius I. of Syracuse selected his wife from Locri: its territory was then increased, and the circuit of its walls was doubled, but it lost its freedom. In 356 B.C. it was ruled by Dionysius II. From the battle of Himera to the year 205 (when it was captured by P. Cornelius Scipio Africanus Maior, and placed under the control of his legate Q. Pleminius), Locri was continually changing its allegiance between Rome and her enemies; but it remained
LOCUST. In its general acceptance this term is applied only to certain insects of the order Orthoptera, family Acrididae. The family Locustidae is now viewed zoologically in a sense that does not admit of the species best known as "locusts" being included therein. The idea of a very destructive insect is universally associated with the term; therefore many orthopterous species that cannot be considered true locusts have been so-called; in North America it has even embraced certain Hemiptera-Hemiptera, belonging to the Cicadidae, and in some parts of England cockchafers are so designated. In a more narrow definition the attribute of migration is associated with the destructive propensities, and it therefore becomes necessary that a true locust should be a migratory species of the family Acrididae. Moreover, the term has yet a slightly different signification as viewed from the Old or New World. In Europe by a locust is meant an insect of large size, the smaller allied species being ordinarily known as "grasshoppers," hence the "Rocky Mountain locust" of North America is to Eastern ideas rather a grasshopper than a locust.

In Europe, and a greater part of the Old World, the best known migratory locust is that which is scientifically termed Pachytylus migratorius, with which an allied species P. migratorius has been often confounded. Another locust found in Europe and neighbouring districts is Calopanus italicus, and still another, Pachytylus peregrinum, has once or twice occurred in Europe, though its home (even in a migratory sense) is more properly Africa and Asia. These practically include all the locusts of the Old World, though a migratory species of South Africa known as Pachytylus peregrinum (presumed to be distinct from P. migratorius) should be mentioned. The Rocky Mountain locust of North America is Calopanus spritus, and in that continent there occurs an Acridium (A. americana) so closely allied to A. peregrinum as to be scarcely distinct therefrom, though there it does not manifest migratory tendencies. In the West Indies and Central America A. peregrinum is also reported to occur.

The females excavate holes in the earth in which the eggs are deposited in a long cylindrical mass enveloped in a glutinous secretion. The young larvae hatch and immediately commence their destructive career. As these insects are "hemimetabolic" there is no quiescent stage; they go on increasing rapidly in size, and as they approach the perfect state the rudiments of the wings begin to appear. Even in this stage their locomotive powers are extensive and their voracity great. Once winged and perfect these powers become infinitely more disastrous, redoubled by the development of the migratory instinct. The laws regulating this instinct are not perfectly understood. Food and temperature have a great deal to do with it, and there is a tendency for the flights to take a particular direction, varied by the physical circumstances of the breeding districts. So likewise each species has its area of constant location, and its area of extraordinary migration. Perhaps the most feasible of the suggestions as to the causes of the migratory impulse is that locusts naturally breed in dry sandy districts in which food is scarce, and are impelled to wander to procure the necessities of life; but against this it has been argued that swarms bred in a highly productive district in which they have temporarily settled will seek the barren home of their ancestors. Another ingenious suggestion is that migratory locusts are intimately connected with a dry condition of the atmosphere, urging them to move on until compelled to stop for food or procreative purposes. Swarms travel considerable distances, though probably generally fewer than 1000 m., though sometimes very much more. As a rule the progress is only gradual, and this adds vastly to the devastating effects.

When an extensive swarm temporarily settles in a district, all vegetation rapidly disappears, and then hunger urges it on to another stage. The large Old World species, although undoubtedly phytogamous, when compelled by hunger sometimes attack at least dry animal substances, and even cannibalism has been asserted as an outcome of the failure of all other kinds of food. The flight of a single light must depend upon

1 The Lat. locusta was first applied to a lobster or other marine shell-fish and then, from its resemblance, to the insect.
circumstances. From peculiarities in the examples of *Acridium peregrinum* taken in England in 1860, it has been asserted that they must have come direct by sea from the west coast of Africa; and what is probably the same species has been seen in the Atlantic at least 1200 m. from land, in swarms completely covering the ship; thus, in certain cases flight must be sustained for several days and nights together. The height at which swarms fly, when their horizontal course is not liable to be altered by mountains, has been variously estimated at from 40 to 200 ft., or even in a particular case to 500 ft. The extent of swarms and the number of individuals in a swarm cannot be accurately ascertained. They come sometimes in such numbers as to completely obscure the sun, when the noise made by the rustling of the wings is deafening. Nevertheless some idea on this point may be formed from the ascertained fact that in Cyprus 1881, at the close of the season, 1,600,000,000 egg-cases, each containing a considerable number of eggs, had been destroyed; the estimated weight exceeding 1,500 tons. Yet two years later, it is believed that not fewer than 5,076,000,000 egg-cases were again deposited in the island.

In Europe the best known and ordinarily most destructive species is *Pachytylus cinerascens*, and it is to it that most of the numerous records of devastations in Europe mainly refer, but it is probably not less destructive in many parts of Africa and Asia. That the arid steppes of central Asia are the home of this insect appears probable; still much on this point is enveloped in uncertainty. In any case the area of permanent distribution is enormous, and that of occasional distribution is still greater. The former area extends from the parallel of 40° N. in Portugal, rising to 45° in France and Switzerland, and passing into Russia at 55°, thence continuing across the middle of Siberia, north of China to Japan; thence south to the Fiji Islands, to New Zealand and North Australia; thence again to Mauritius especially is this the case, because there exists a distinct species, known as *P. migratorius*, the migratory area of which appears to be confined to Turkestan and eastern Europe. *P. cinerascens* is certainly the most common of the "locusts" occasionally found in the British Isles, and E. de Selys-Longchamps is of opinion that it breeds regularly in Belgium, whereas the true *P. migratorius* is only accidental in that country.

A South African species allied to the preceding and provisionally identified as *Pachytylus salticollis* is noteworthy from the mani-

![Fig. 1.—*Pachytylus migratorius*. This and the other figures are all natural size.](image-url)

![Fig. 2.—*Acridium peregrinum*.](image-url)
Rocky Mountains westward, or to have extended into the eastern states.

As to remedial or preventive measures tending to check the ravages of locusts, little unfortunately can be said; but anything that will apply to one species may be used with practically all. Something can be done (as is now done in Cyprus) by offering a price for all the egg-tubes collected, which is the most direct manner of attacking them. Some little can be done by destroying the larvae while in an unwinged condition, and by digging trenches in the line of march into which they can fall and be drowned or otherwise put an end to. Little can be done with the winged hordes: starvation, the outcome of their own work, probably here does much. In South Africa some success has attended the spraying of the swarms with arsenic. It has been shown that with all migratory locusts the breeding-places, or true homes, are comparatively barren districts (mostly elevated plateaus); hence the progress of colonization, and the conversion of those heretofore barren plains into areas of fertility, may (and probably will) gradually lessen the evil.

Locusts have many enemies besides man. Many birds greedily devour them, and it has many times been remarked that migratory swarms of the insects were closely followed by myriads of birds.

Fig. 4.—Rocky Mountain Locust (Caloptenus spreites). (After Riley.)

a, a, Female in different positions, ovipositing.
b, Egg-pod extracted from ground, with the end broken open.
c, A few eggs lying loose on the ground. f, Shows where such a mass has been covered up.

Predatory insects of other orders also attack them, especially when they are in the unwinged condition. Moreover, they have still more deadly insect foes as parasites. Some attack the fully developed winged insect. But the greater part attack the eggs. To such belong certain beetles, chiefly of the family Cteniidae, and especially certain two-winged flies of the family Bombyliidae. These latter, both in the Old and New World, must prevent vast quantities of eggs from producing larvae.

The larger Old World species form articles of food with certain semi-civilized and savage races, by whom they are considered as delicacies, or as part of ordinary diet, according to the race and the method of preparation.

(R. M.L.; R. I. P.)

**LOCUST-TREE—LODGE, E.**

**LOCUST-TREE,** or Carob-Tree (*Ceratonia siliqua*), a member of the tribe Cassieae of the order Leguminosae, the sole species of its genus, and widely diffused spontaneously and by cultivation from Spain to the eastern Mediterranean regions. The name of the genus is derived from the often curved pod (Gr. *képarion,* a little horn). The flowers have no petals and are polymamous or dioecious (male, female, and hermaphrodite flowers occur). The seed-pod is compressed, often curved, indented and coriaceous, but with sweet pulpy divisions between the seeds, which, as in other genera of the *Cassieae,* are albuminous. The pods are eaten by men and animals, and in Sicily a spirit and a syrup are made from them. These husks being often used for awine are so called swine’s bread, and are probably referred to in the parable of the Figodial Son. It is also called St John’s bread, from a misunderstanding of Matt. iii. 4. The carob-tree was regarded by Sprengel as the tree with which Moses sweetened the bitter waters of Marah (Exod. xv. 25), as the *kharrub,* according to Avicenna (p. 205), has the property of sweetening salt and bitter waters. Gerard (*Herball,* p. 1241) cultivated it in 1597, it having been introduced in 1570.

**LODEVÉ,** a town of southern France, capital of an arrondissement of the department of Hérault, 36 m. W.N.W. of Montpellier by rail. Pop. (1906), 6142. It is situated in the southern Cévennes at the foot of steep hills in a small valley where the Soulondres joins the Le, a tributary of the Hérault. Two bridges over the Le connect the town with the faubourg of Carmes on the left bank of the river, and two others over the Soulondres lead to the extensive ruins of the château de Montbrun (13th century). The old fortified cathedral of St Fulcan, founded by him in 950, dates in its present condition from the 13th, 14th and 16th centuries; the cloister, dating from the 13th and 17th centuries, is in ruins. In the picturesque environs of the town stands the well-preserved monastery of St Michel de Grammont, dating from the 12th century and now used as farm buildings. In the neighbourhood are three fine dolmens. The manufacture of woolens for army clothing is the chief industry. Wool is imported in large quantities from the neighbouring departments, and from Morocco; the exports are cloth to Italy and the Levant, wine, bran, and wood. The town has tribunals of first instance and of commerce, a board of trade- arbitrators, a chamber of arts and manufactures, and a communal college.

Lodève (Luteva) existed before the invasion of the Romans, who for some time called it *Forum Neronis.* The inhabitants were converted to Christianity by St Flur, first bishop of the city, about 325. After passing successively into the hands of the Visigoths, the Franks, the Ostrogoths, the Arabs and the Carolingians, it became in the 9th century a separate countship, and afterwards the domain of its bishops. During the religious wars it suffered much, especially in 1573, when it was sacked. It ceased to be an episcopal see at the Revolution.

**LODGE, EDMUND** (1756–1839). English writer on heraldry, was born in London on the 13th of June 1756, son of Edmund Lodge, rector of Carshalton, Surrey. He held a cornet’s commission in the army, which he resigned in 1773. In 1782 he became Bluemantle pursuivant-at-arms in the College of Arms. He subsequently became Lancaster herald, Norroy king-at-arms, Clarenceux king-at-arms, and, in 1832, knight of the order of the Guelphs of Hanover. He died in London on the 16th of January 1839. He wrote *Illustrations of British History, Biography and Manners in the reigns of Henry VIII, Edward VI, Mary, Elizabeth and James I* . . . (3 vols., 1791), consisting of selections from the MSS. of the Howard, Talbot and Cecil families preserved at the College of Arms; *Life of Sir Julius Caesar* . . . (2nd ed., 1827). He contributed the literary matter to *Pitman's Illustrious Persons of Great Britain* (1814, &c.), an elaborate work of which a popular edition is included in Bohn’s “Illustrated Library.” His most important work on heraldry was *The Genealogy of the existing British Peerage* . . . (1832; enlarged edition, 1859). In *The Annual Peerage and Baronage* (1827–1839), reissued after 1832 as *Peerage of the British Empire,* and generally known as Lodge’s *Peerage,* his share did not go beyond the title-page.
LODGE, H. C.—LODGE, T.

LODGE, HENRY CABOT (1850—1910), American political leader and author, was born in Boston, Massachusetts, on the 12th of May 1850. He graduated at Harvard College in 1871 and at the Harvard Law School in 1875; was admitted to the Suffolk (Massachusetts) bar in 1876; and in 1876-1879 was instructor in American history at Harvard. He was a member of the Massachusetts House of Representatives in 1880-1881, and of the National House of Representatives in 1887-1893; succeeded Henry L. Dawes as United States Senator from Massachusetts in 1893; and in 1899 and in 1905 was re-elected to the Senate, where he became one of the most prominent of the Republican leaders, and an influential supporter of President Roosevelt. He was a member of the Alaskan Boundary Commission of 1903, and of the United States Immigration Commission of 1907. In the National Republican Convention of 1906 his influence did much to secure the adoption of the gold standard " plank" of the party's platform. He was the permanent chairman of the National Republican Convention of 1900, and of that of 1908. In 1874-1876 he edited the North American Review with Henry Adams; and in 1879-1882, with John T. Morse, Jr., he edited the International Review. In 1884-1898 he was an overseer of Harvard College. His doctoral thesis at Harvard was published with essays by Henry Adams, J. L. Laughlin and Ernest Young, under the title Essays on Anglo-Saxon Land Law (1876). He wrote: Life and Letters of George Cabot (1877); Alexander Hamilton (1882), Daniel Webster (1883) and George Washington (2 vols., 1889), in the " American Statesmen " series; A Short History of the English Colonies in America (1881); Studies in History (1884); Boston (1891), in the " Historic Towns " series; Historical and Political Essays (1895); with Theodore Roosevelt, Hero-Tales of the United States (1895); Certain Accepted Heroes (1897); The Story of the American Revolution (2 vols., 1898); The War with Spain (1898); A Fighting Frigate (1902); A Frontier Town (1906); and, with J. W. Garner, A History of the United States (4 vols., 1896). He edited The Works of Alexander Hamilton (9 vols., 1883-1886) and The Federalist (1891).

His son, GEORGE CABOT LODGE (1873—1940), also became known as an author, with The Song of the Wave (1898), Poems, 1890-1902 (1902), The Great Adventure (1905), Cain: a Drama (1904), Herakles (1908) and other verse.

LODGE, SIR OLIVER JOSEPH (1851— ), English physicist, was born at Penkhill, Staffordshire, on the 12th of June 1851, and was educated at Newport (Salop) grammar school. He was intended for a business career, but being attracted to science he entered University College, London, in 1872, graduating M.A. (1875) and B.Sc. (1877). In 1873 he was appointed reader in natural philosophy at Bedford College for Women, and in 1879 he became assistant professor of applied mathematics at University College, London. Two years later he was called to the chair of physics in University College, Liverpool, where he remained till in 1900 he was chosen first principal of the new Birmingham University. He was knighted in 1902. His original work includes investigations on lightning, the seat of the electromotive force in the voltaic cell, the phenomena of electrolysis and the speed of the ion, electromagnetic waves and wireless telegraphy, the motion of the aether near the earth, and the application of electricity to the dispersal of fog and smoke. He presided over the mathematical and physical section of the British Association in 1891, and served as president of the Physical Society in 1890-1891 and of the Society for Psychical Research in 1901-1904. In addition to numerous scientific memoirs he wrote, among other works, Lightning Conductors and Lightning Guards, Signalling without Wires, Modern Views of Electricity, Electrons and The Ether of Space, together with various books and papers of a metaphysical and theological character.

LODGE, THOMAS (c. 1558-1625), English dramatist and miscellaneous writer, was born about 1558 at West Ham. He was the second son of Sir Thomas Lodge, who was lord mayor of London in 1562-1563. He was educated at Merchant Taylors' School and Trinity College, Oxford; taking his B.A degree in 1577 and that of M.A. in 1581. In 1578 he entered Lincoln's Inn, where, as in the other Inns of Court, a love of letters and a crop of debts and difficulties were alike wont to spring up in a kindly soil. Lodge, apparently in disregard of the wishes of his family, speedily showed his inclination towards the looser ways of life and the lighter aspects of literature. When the penitent Stephen Gosson had (in 1579) published his School of Abuse, Lodge took up the glove in his Defence of Poetry, Music and Stage Plays (1579 or 1580; reprinted for the Shakespeare Society, 1853), which shows a certain restraint, though neither deficient in force of invective nor backward in display of crudity. The pamphlet was prohibited, but appears to have been circulated privately. It was answered by Gosson in his Plays Confuted in Five Actions; and Lodge retorted with his Alarum Against Usurers (1584, reprinted 1588)—a "tract for the times" which no doubt was in some measure indebted to the author's personal experience. In the same year he produced the first tale written by him on his own account in prose and verse, The Delectable History of Forbonius and Prisceria, both published and reprinted with the Alarum. From 1587 onwards he seems to have made a series of attempts as a playwright, though most of those attributed to him are mainly conjectural. That he ever became an actor is improbable in itself, and Collier's conclusion to that effect rested on the two assumptions that the "Lodge" of Henslowe's M.S. was a player and that his name was Thomas, neither of which is supported by the text (see C. M. Ingleby, Was Thomas Lodge an Actor? 1868). Having, in the spirit of his age, "tried the waves" with Captain Clarke in his expedition to Terceira and the Canaries, Lodge in 1591 made a voyage with Thomas Cavendish to Brazil and the Straits of Magellan, returning home by 1593. During the Canaries expedition, to beguile the tediousness of his voyage, he composed his prose tale of Rosalyme, Euphues Golden Legacie, which, printed in 1590, afterwards furnished the substance of Shakespeare's As You Like It. The novel, which in its turn owes some, though no very considerable, debt to the medieval Tale of Gamelyn (unwarrantably appended to the fragmentary Cooke's Tale in certain MSS. of Chaucer's works), is written in the eulogistic manner, but decidedly attractive both by its plot and by the situations arising from it. It has been frequently reprinted. Before starting on his second expedition he had published an historical romance, The History of Robert, Second Duke of Normandy, surmised Robert the Divil, and he left behind him for publication Catharos, Diogenes in his Singularity, a discourse on the immortality of Athens (London). Both appeared in 1591. Another romance in the manner of Lyly, called The Shadow of Death (1592), appeared also. While Lodge was still was on his travels. His second historical romance, the Life and Death of William Longbeard (1593), was more successful than the first. Lodge also brought back with him from the new world A Margarita of America (published 1596), a romance of the same description interspersed with many lyrics. Already in 1589 Lodge had given to the world a volume of poems bearing the title of the chief among them, Scillaes Metamorphosis, Enterlaced with the Unfortunate Love of Glauclus, more briefly known as Glaucus and Scilla (reprinted with preface by S. W. Singer in 1819). To this tale Shakespeare was possibly indebted for the idea of Venus and Adonis. Some readers would perhaps be prepared to give up this and much else of Lodge's sugared verse, fine though much of it is in quality, largely borrowed from other writers, French and Italian in particular, in exchange for the lost Sailor's Calendar, in which he must in one way or another have recounted his sea adventures. If Lodge, as has been supposed, was the Alcon in Colin Clout's come Home Again, it may have been the influence of Spenser which led to the composition of Phillis, a volume of sonnets, in which the voice of nature seems only now and then to become audible, published with the narrative poem, The Compleanye of Elsied, in 1593. A Fig for Momus, on the strength of which he has been called the earliest English satirist, and which contains eclogues addressed to Daniel and others, an epistle addressed to Drayton, and another piece, appeared in 1595. Lodge's ascendant dramatic work is small in quantity. In conjunction with Greene he, probably in 1590, produced in a popular vein the odd but far from feeble
play of *A Looking Glass for London and England* (printed in 1594). He had already written *The Wounds of Civil War. Lively set forth in the Tragedies of Marius and Scilla* (produced perhaps as early as 1587, and published in 1594), a good second-rate piece in the half-chronicle fashion of its age. Mr F. G. Fleay thinks there were grounds for assigning to Lodge *Medicusorius and Amadine*, played by the Queen's Men about 1588, a share with Robert Greene in George a Greene, the Pinner of Wakefield, and in Shakespeare's 2nd part of *Henry VI*; he also regards him as at least part-author of The True Chronicle of King Leir and his three Daughters (1594); and The Troublesome Raigne of John, King of England (c. 1588): in the case of two other plays he allowed the assignation to Lodge to be purely conjectural. That Lodge is the 'Young Juvenal' of Greene's *Groatworth of Wit* is no longer a generally accepted hypothesis. In the latter part of his life—possibly about 1596, when he published his *Wris Miserie* and the World's Misadventure, which is dated from Low Leyton in Essex, and the religious tract Prosopopeia (if, as seems probable, it was his), in which he repents of his 'laid lines' of other days—he became a Catholic and engaged in the practice of medicine, for which Wood says he qualified himself by a degree at Avignon in 1600. Two years afterwards he received the degree of M.D. from Oxford University. His works henceforth have a sober cast, comprising translations of Josephus (1602), of Seneca (1614), a *Learned Summary of Du Bartas's Divine Religion* (1625 and 1637), besides a *Treatise of the Pledge* (1633), and a popular manual, which remain unpublished, on *Domestic Medicine*. Early in 1606 he seems to have left England, to escape the persecution then directed against the Catholics; and a letter from him dated 1608 thanks the English ambassador in Paris for enabling him to return in safety. He was abroad on urgent private affairs of one kind and another in 1616. From this time to his death in 1625 nothing further concerning him remains to be noted. Lodge's works, with the exception of his translations, have been reprinted for the Hunterian Club with an introductory essay by Mr Edmund Gosse. This preface was reprinted in Mr Gosse's *Seventeenth Century Studies* (1885). Of Rosalynde there are numerous modern editions, e.g., J. I. *English Tragedy in the Time of Shakespeare* (Eng. trans., 1890); F. G. Fleay, *Biographical Chronicle of the English Drama* (vol. ii., 1891). (A. W. W.)

**LODGE.** A dwelling-place, small and usually temporary, a hut, booth or tent. The word was in M. Eng. *logge*, from Fr. *loge*, in modern *laure* a hut, also in a box in a theatre; the French word, like the Italian *loggia*, came from the Med. Lat. *laubia* or *lobia*, the sheltered promenade in a cloister, from which English "lobby" is derived. The Latin is of Teutonic origin from the word which survives in the Mod. Ger. *Lauhe*, an arbour, but which earlier was used for any hut, booth, &c. The word is probably ultimately from the root which appears in "leaf," meaning a rough shelter of foliage or boughs. The word is especially used of a house built either in a forest or away from habitation, where people stay for the purpose of sport, as a "hunting lodge," "shooting lodge," &c. The most frequent use of the word is of a small building, usually placed at the entrance to an estate or park and inhabited by a dependant of the owner. In the same sense the word means the room or box inhabited by the porter of a college, factory or public institution. Among Freemasons and other societies the "lodge" is the name given to the meeting-place of the members of the branch or district, and is applied to the members collectively as "a meeting of the lodge." The governing body of the Freemasons presided over by the grand master is called the "Grand Lodge." At the university of Cambridge the house where the head of a college lives is called the "lodge." Formerly the word was used of the entire building of an inn, but is now only applied to that of the beer and the oyster. It is also applied to the tent of a North American Indian, a wigwam or tepee, and to the number of inhabitants of such a tent. In mining the term is used of a subterraneous reservoir made at the bottom of the pit, or at different levels in the shaft for the purpose of draining the mine. It is used also of a room or landing-place next to the shaft, for discharging ore, &c.

**LODGER AND LODGINGS.** The term "lodger" (Fr. *loger*, to lodge) is used in English law in several slightly different senses. It is applied (i.) most frequently and properly to a person who takes furnished rooms in a house, the landlord also residing on the premises, and supplying him with attendance; (ii.) sometimes to a person, who takes unfurnished rooms in a house finding his own attendance; (iii.) to a boarder in a boarding-house (q.v.). It is with (i.) and (ii.) alone that this article is concerned.

Where furnished apartments are let for immediate use, the law implies an undertaking on the part of the landlord that they are fit for habitation, and, if this condition is broken, the tenant may refuse to occupy the premises or to pay any rent. But there is no implied contract that the apartments shall continue fit for habitation; and the rule has no application in the case of unfurnished lodgings. In the absence of express agreement to the contrary, a lodger has a right to the use of everything necessary to the enjoyment of the premises, such as the door bell and knocker and the skylight of a staircase. Whether the rent of apartments can be distrained for by the immediate landlord where he resides on the premises and supplies attendance is a question the answer to which is involved in some uncertainty. The weight of authority seems to support the negative view (see Foa, *Landlord and Tenant*, 3rd ed. p. 434). To make good a right to distrain it is necessary to show that the terms of the letting create a tenancy or exclusive occupation and not a mere licence. Where the owner, although residing on the premises, does not supply attendance, the question depends on whether there is a real tenancy, giving the lodger an exclusive right of occupation as against the owner. The ordinary test is whether the lodger has the control of the outer door. But the whole circumstances of each case have to be taken account of. A lodger is rateable to the poor-rate where he is in exclusive occupation of the apartments let to him and the landlord does not retain the control and domination of the whole structure. As to distress on a lodger's goods for rent due by an immediate to a superior landlord, see RENT. As to the termination of short tenancies, as of apartments, see LANDLORD AND TENANT. The landlord has no lien on the goods of the lodger for rent or charges. Over-crowding-lodging-houses may be dealt with as a nuisance under the Public Health Acts 1875 and 1891 and the Housing of the Working Classes Acts. As to the lodger franchise, see REGISTRATION OF VOTERS. It has been held in England that keepers of lodging-houses do not come within the category of those persons (see CARRIER; INNKEEPER) who hold themselves out to the public generally as trustworthy in certain employments; but that they are under an obligation to take reasonable care for the safety of their lodgers' goods; see Scarborough v. Cosgrove, 1805, 2 K.B. 805. As to Scots law see Bell's *Prin.* s. 236 (a).

In the United States, the English doctrine of an implied warranty of fitness for habitation on a letting of furnished apartments has only met with partial acceptance; it was repudiated, e.g., in the District of Columbia, but has been accepted in Massachusetts. In the French Code Civil, there are some special rules with regard to furnished apartments. The letting is reputed to be made for a year, a month or a day, according as the rent is so much per year, per month or per day; if that test is inapplicable, the letting is deemed to be made according to the custom of the place (art. 1728). There are similar provisions in the Civil Codes of Belgium (art. 1728), Holland (art. 1622) and Spain (Civil Code, art. 1581).

See also the articles, BOARDING HOUSE, and FLAT; and the bibliographies to FLAT AND LANDLORD AND TENANT. (A. W. R.)

**LODI,** a town and episcopal see of Piedmont, Italy, in the province of Milan, 25 m. by rail S.E. of that city, on a hill of the right bank of the Ada, 350 ft. above sea-level. Pop. (1901) 10,070 (town), 16,857 (commune). The site of the city is an eminence rising very gradually from the Lombard plain, and the surrounding country is one of the richest dairy districts in Italy. The cathedral (1158), with a Gothic façade and a 17th-century lateral tower, has a restored interior. The church of the Incoronata was erected by Battagio (1488) in the Bramantesque style. It is an elegant octagonal domed structure, and is
decorated with frescoes by the Piazza family, natives of the town, and four large altar-pieces by Calisto Piazza (died after 1561). There is a fine organ of 1599. The 13th-century Gothic church of San Francesco, restored in 1888, with 14th-century paintings, is also noticeable. The Palazzo Modegnani has a fine gateway in the style of Bramante, and the hospital a cloistered quadrangle.

In the Via Pompeia is an early Renaissance house with fine decorations in marble and terra-cotta. Besides an extensive trade in cheese (Lodi producing more Parmesan than Parma itself) and other dairy produce, there are manufactures of linen, silk, majolica and chemicals.

The ancient Laus Pompeia lay 33 m. W. of the present city, and the site is still occupied by a considerable village, Lodi Vecchio, with the old cathedral of S. Bassiano, now a brick building, which contains 15th-century frescoes. It was the point where the roads from Mediolanum to Placentia and Cremona diverged, and there was also a road to Ticinum turning off from the former, but it is hardly mentioned by classical writers. It appears to have been a municipium. No ruins exist above ground, but various antiquities have been found here.

From which Pompeius, whether Cn. Pompeius Strabo, who gave citizenship to the Transpadani, or his son, the more famous Pompey, it took its name is not certain. In the middle ages Lodi was second to Milan among the cities of northern Italy. A dispute with the archbishop of Milan about the investiture of the bishop of Lodi (1024) proved the beginning of a protracted feud between the two cities. In 1111 the Milanesi laid the whole place in ruins and forbade their rivals to restore what they had destroyed, and in 1156, when in spite of this prohibition a fairly flourishing settlement had again been formed, they repeated their work in a more thorough manner. A number of the Lodigians had settled on Colle Eghezone; and their village, the Borgot d'Isella, on the site of a temple of Hercules, soon grew up under the patronage of Frederick Barabossa into a new city of Lodi (1162). At first subservient to the emperor, Lodi was before long compelled to enter the Lombard League, and in 1198 it formed alliance offensive and defensive with Milan. The strife between the Sommariva or aristocratic party and the Overnaghi or democratic party was so severe that the city divided into two distinct communes. The Overnaghi, expelled in 1236, were restored by Frederick II. who took the city after three months' siege. Lodi was actively concerned in the rest of the Guelf and Ghibelline struggle. In 1416 its ruler, Giovanni Vignati, was treacherously taken prisoner by Filippo Maria Visconti, and after that time it became dependent on Milan. The duke of Brunswick captured it in 1625, in the interests of Spain; and it was occupied by the French (1701), by the Austrians (1760), by the king of Sardinia (1755), by the Austrians (1760), by the Spaniards (1745), and again by the Austrians (1746). On the 14th of May 1796 fought the battle of Lodis between the Austrians and Napoleon, which made the last master of Lombardy.

Lodz (Lothen; more correctly Lodzlia), a town of Russian Poland, in the government of Piotrkow, 82 m. by rail S.W. of Warsaw. It is situated on the Lodz plateau, which at the beginning of the 19th century was covered with impenetrable forests. Now it is the centre of a group of industrial towns—Zgorz, L outposta, Pabianice, Konstantinov and Aleksandrov. Chiefly owing to a considerable immigration of German capitalists and workers, Lodz has grown with American-like rapidity. It consists principally of one main street, 7 m. long, and is a sort of Polish Manchester, manufacturing cottons, woollens and mixed stuffs, with chemicals, beer, machinery and silk. One of the very few educational institutions is a professional industrial school. The population, which was only 50,000 in 1879, reached 355,570 in 1905; the Poles numbering about 37%, Germans 40%, and Jews 22½%.

Loess (Ger. LÖS), in geology, a variety of loam. Typical loess is a soft, porous rock, pale yellowish or buff in colour; one characteristic property is its capacity to retain vertical, or even over-hanging, walls in the banks of streams. These vertical walls have been well described by von Richthofen (Führer für Forschungsreisende, Berlin, 1886) in China, where they stand in some places 500 ft. high and contain innumerable natural dwellings; ancient roads too have worn their way vertically downways as deep in the deposit, forming trench-like ways. This character in the loess of the Mississippi region gave rise to the name “Bluff formation.” A coarse columnar structure is often exhibited on the vertical weathered faces of the rock. Another characteristic is the presence throughout the rock of small capillary tubules, which appear to have been occupied by rootlets; these are often lined with calcite. Typical loess is usually calcareous; some geologists regard this as an essential property, and when the rock has become decalcified, as it frequently is on the surface by weathering, they call it “loess-loam” (löslehm). In the lower portions of a loess deposit the calcium carbonate tends to form concretions, which on account of their mimetic forms have received such names as lösskinderchen, lössrippen, poupées du loess, “loess dolls.” In deposits of this nature in South America these concretionary masses form distinct beds. Bedding is absent from typical loess. The mineral composition of loess varies somewhat in different regions; but in the principal small; they consist of angular grains of quartz, fine particles, hydroxylated silicates of alumina, mica scales and undecomposed fragments of felspar, hornblende and other rock-forming silicates.

In Europe and America loess deposits are associated with the margins of the great ice sheets of the glacial period; thus in Europe they stretch irregularly through the central eastwards from the north and south towards Lodi and the Lombardy plain etc. In both regions loess deposits are found within and upon glacial deposits. For this reason the loess is very commonly assigned to the Pleistocene period; but some of the loess deposits of northern Europe have been found to be of much greater age, while in Australia and America it is of a very much younger age, and in South America the great loess formations known as the Pampen and Patagonian belong to the Eocene, Oligocene and Pleistocene periods. Most geologists agree that the loess is an accumulation of fine wind-blown material which has been blown by the wind to long series, and has been laid down under tundra or steppe conditions. The capillary tubules are supposed to have been caused by the roots of grass and herbage which kept growing upon the surface even while the deposit was slowly increasing. Others contend that loess is of the nature of alluvial loess; that this may be true of certain deposits classed as loess, but it cannot be true of most of the typical loess formations, for they lie upon older rocks quite independently of altitude, from near sea level up to 5000 ft. in Europe and to 15,000 ft. in China; they are often developed on one side of a mountain range while the other is bare. One of the most striking examples of this is where the Tiesli and the Loisids, which are a series of approximately parallel valleys the loess is frequently found lying upon one side and that the same in each case, facts pointing to the agency of water as prevalent with a water.
Scotch Reviews, ridiculed Loft as "the Maecenas of shoe-makers and preface-writer general to distrested versemen; a kind of grand acoucheur to those who wish to be delivered of rhyme, but do not know how to bring forth." He died at Montcalieri, near Turin, on the 26th of May 1824.

His fourth son Capel Loft, the younger (1806-1873), also a writer on various topics, inherited his father's liberal ideas and principles, and carried them in youth to greater extremes. In his old age he abandoned these theories, which had brought him into the company of some of the leading political agitators of the day. He died in America, where he had a Virginia estate.

LOFOTEN AND VESTERAALEN—LOFTUS

A large and picturesque group of islands lying N.E. and S.W. off the N.W. coast of Norway, between 67° 30' and 60° 20' N., and between 12° and 16° 35' E. forming part of the amt (county) of Nordland. The extreme length of the group from Andenes, at the north of Andø, to Røst, is about 150 m.; the aggregate area about 1560 sq. m. It is separated from the mainland by the Vestfjord, Tjeldsund and Varangerfjord, and is divided into two sections by the Raftsund between Hindo and Øst-Vaagø. To the W. and S. of the Raftsund lie the Vesteral lands proper, of which the most important are Øst-Vaagø, Gimsøi, Vest-Vaagø, Flakstadø, Moskenaø, Mosken, Våre and Røst; E. and N. of the Raftsund are the islands of Vesterålen, the chief being Hindo, Ulvo, Langø, Skogø and Andø. The islands, which are all of granite or metamorphic gneiss, are precipitous and lofty. The highest points and finest scenery are found on Øst-Vaagø, in the neighbourhood of the narrow, cliff-bound Raftsund and Trolsfjord. The principal peaks are Higrafstind (3811 ft.), Gjeitjalgjærtind (3555), Rulten (3483), the Noltind (3467), Sverigsundtind (3506). The long line of jagged and fantastic peaks seen from the Vestfjord forms one of the most striking prospects on the Norwegian coast, but still finer is the panorama from the Digermsrud (1150 ft.), embracing the islands, the Vestfjord, and the mountains of the mainland. The channels which separate the islands are narrow and tortuous, and generally of great depth; they are remarkable for the strength of their tidal currents, particularly the Raftsund and the famous Maelstrom or Moskenstraumen between Mosken and Mosken. The violent tempests which sweep over the Vestfjord, which is exposed to the S.W., are graphically described in Jonas Lie's "Den Fremstyrte" (1870) and in H. Schultz's "Udvælget Skriver" (1883), as the Maelstrom is imaginatively by Edgar Allan Poe. Though situated wholly within the Arctic circle, the climate of the Lofoten and Vesteralen group is not rigorous when compared with that of the rest of Norway. The isothermal line which marks a mean January temperature of 32° F. runs south from the Lofoten, passing a little to the east of Bergen onward to Gothenburg and Copenhagen. The prevailing winds are from the S. and W., the mean temperature for the year is 35°-5° F., and the annual rainfall is 43°-34 in. In summer the hills have only patches of snow, the snow limit being about 3000 ft. The natural pasture produced in favourable localities permits the rearing of cattle to some extent; but the growth of cereals (chiefly barley, which here matures in ninety days) is insignificant. The islands yield no wood. The characteristic industry, and an important source of the national wealth, is the cod fishery, carried on along the east coast of the Lofoten in the Vestfjord in spring. This employs about 40,000 men during the season from all parts of Norway, the population being then about doubled, and the surplus accommodated in temporary huts. The average yield is valued at about £15,000. The fish are taken in nets let down during the night, or on lines upwards of a mile in length, or on ordinary hand-lines. The fishermen are paid in cash, and large sums of money are sent to the islands by the Norwegian banks each February. Great loss of life is frequent during the sudden local storms. The fish, which is dried during early summer, is exported to Spain (where it is known as bacalao), Holland, Great Britain, Belgium, &c. Industries arising out of the fishery are the manufacture of cod-liver oil and of artificial manure. The summer cod fisheries and the lobster fishery are also valuable. The herring is taken in large quantities off the west coasts of Vesterålen, but is a somewhat capricious visitant. The islands contain no towns properly so called, but Kabelvaag on Øst-Vaagø and Svolvaer on a few rocky islets off that island are considerable centres of trade and (in the fishing season) of population; Lodingen also, at the head of the Vestfjord on Hindø, is much frequented as a port of call. A church existed at Vaagen (Kabelvaag) in the 12th century, and here Hans Egede, the missionary of Greenland, was pastor. There are factories for fish guano at Henningvaer (Øst-Vaagø), Kabelvaag, Svolvaer, Lodingen, and at Bretnissen on Store Molla. Regular means of communication are afforded by the steamers which trade between Hamburg or Christiania and Hammerfest, and also by local vessels; less accessible spots can be visited by small boats, in the management of which the natives are adept. There are some roads on Hindø, Langø, and Andø. The largest island in the group, and indeed in Norway, is Hindø, with an area of 860 sq. m. The south-eastern portion of it belongs to the amt of Tromsø. In the island of Andø there is a bed of coal at the mouth of Ramsa.

LOFT (connected with "lift," i.e. raised in the air; O. Eng. līft and Ger. Luft; the French term is gournier and Ger. Boden), the term given in architecture to an upper room in the roof, sometimes called "cockloft"; when applied over stabling it is known as a hay-loft; the gallery over a chancel screen, carrying a cross, is called a rood-loft (see ROOF). The term is also given to a gallery provided in the choir-aisle of a cathedral or church, and used as a watching-loft at night.

LOFTUS, ADAM (c. 1533-1605), archbishop of Armagh and Dublin, and lord chancellor of Ireland, the son of a Yorkshire gentleman, was educated at Cambridge. He accompanied the earl of Sussex to Ireland as his chaplain in 1560, and three years later was consecrated archbishop of Armagh by Hugh Curwen, archbishop of Dublin. In 1565 Queen Elizabeth, to supplement the meagre income derivable from the archiepiscopal see owing to the disturbed state of the country, appointed Loftus temporarily to the deanery of St Patrick's; and in the same year he became president of the new commission for ecclesiastical causes. In 1567 he was translated to the archbishopric of Dublin, where the queen looked to him to carry out reforms in the Church. On several occasions he temporarily executed the functions of lord keeper, and in August 1581 he was appointed lord chancellor of Ireland. Loftus was constantly occupied in attempts to improve his financial position by obtaining additional preferment. He had been obliged to resign the deanery of St Patrick's in 1567, and twenty years later he quarrelled violently with Sir John Perrot, the lord deputy, over the proposal to appropriate the revenues of the cathedral to the foundation of a university. Loftus, however, favoured the project of founding a university in Dublin, though on lines different from Perrot's proposal, and it was largely through his influence that the corporation of Dublin granted the lands of the priory of All Hallows as a beginning of the endowment of Trinity College, of which he was named first provost in the charter creating the foundation in 1591. Loftus, who had an important share in the administration of Ireland under successive lords deputy, and whose zeal and efficiency were commended by James I on his accession, died in Dublin on the 4th of April 1605. By his wife, Jane Purdon, he had twenty children.

His brother Robert was father of ADAM LOFTUS (c. 1568-1643), who became lord chancellor of Ireland in 1619, and in 1622 was created Viscount Loftus of Ely, King's county, in the peerage of Ireland. Lord Loftus came into violent conflict with the lord deputy, Viscount Falkland, in 1624; and at a later date his quarrel with Strafford was still more fierce. One of the articles in Strafford's impeachment was based on his dealings with Loftus. The title, which became extinct on the death of his grandson, the 3rd viscount, in 1725 (when the family estate of Monasterervan, re-named Moore Abbey, passed to his daughter's son Henry, 4th earl of Drogheda), was re-granted in 1756 to his cousin Nicholas Loftus, a lineal descendant of the archbishop. It again became extinct more than once afterwards, but was on each occasion revived in favour of a descendant through the
female line; and it is now held by the marquis of Ely in conjunction with other family titles.

LOG (a word of uncertain etymological origin, possibly onomatopoetic; the New English Dictionary rejects the derivation from Norwegian lág, a fallen tree), a large piece of generally unshaped wood. The word is also used in various figurative senses, and more particularly for the "nautical log," an apparatus for ascertaining the speed of ships. Its employment in this sense depends on the fact that a piece of wood attached to a line was thrown overboard to lie like a log in a fixed position, motionless, the vessel's speed being calculated by observing what length of line ran out in a given time ('common log'); and the word has been retained for the modern "patent" or "continuous" log, though it works in an entirely different manner.

The origin of the "common log" is obscure, but the beginnings of the "continuous log" may be traced back to the 16th century. By an invention probably due to Humphry Cole and published in 1578 by William Bourne in his Inventions and Devices, it was proposed to register a ship's speed by means of a "little small close boat," with a wheel, or wheels, and an axle-tree to turn clockwork in the little boat, with dials and pointers indicating fathoms, leagues, scores of leagues and hundreds of leagues. About 1668 Dr R. Hooke showed some members of the Royal Society an instrument for the same purpose, depending on a vane or fly which rotated as the vessel progressed (Birch, History of the Royal Society, iv. 231), and Sir Isaac Newton in 1715 reported unfavourably on the "marine surveyor" of Henry de Saumarez, which also depended on a rotator. Conrad Mel in his Antiquarius Sacer (1719) described a "batometron" which he claimed would show without calculation the distance sailed by the ship; and J. Smeston in 1754 published improvements on the apparatus of Saumarez. William Foxon of Deptford in 1772, James Guerimand of Middlesex in 1776 (by his "marine perambulator"), and R. H. Gower in 1772, practically demonstrated a registration of a vessel's speed by mechanical means. Viscount de Vaux in 1807 made use of water-pressure, as did the Rev. E. L. Berthon in 1849, and C. E. Kelway introduced an electrical log in 1876.

Common Log.—To ascertain the ship's speed by the common log four articles are necessary—a log-ship or log-boat, log-reel, log-line and log-glass. The log-ship (fig. 1) is a wooden quadrant ¼ in. thick, with a radius of 5 or 6 in., the circumference of which is weighted with lead to keep it upright and retard its passage through the water. Two holes are made near its lower angles. One end of a short piece of thin line is passed through one of these holes, and knotted; the other end has spliced to it a hard bone peg which is inserted in the other hole. The holes are so placed that the log-ship will hang square from the span thus formed. The log-line is secured to this span and consists of two parts. The portion nearest the log-ship is known as the "stray line"; its length varies from 10 to 20 fathoms, but should be sufficient to ensure that the log-ship shall be outside the disturbing element of the ship's wake. The point where it joins the other part is marked by a piece of bunting, and the line from this point towards its other end is marked at known intervals with "knots," which consist of pieces of cord worked in between its ends. A mean distance between knots should be 60-00 statute miles of 5280 ft., the nautical mile (4°/6 degree) taken as 6080 ft., which is a sufficiently close approximation for practical purposes, and the distances between the knots are made to bear the same relation to 6080 ft as 28 seconds to an hour (3600 seconds); that is, they are placed at intervals of 47 ft. 3 in. The end of the first interval of this length (counting from the piece of bunting) is marked by a bit of leather, the second by a cord with two knots, the third by one with three knots, and so on; the middle of each of these lengths (half-knot) is also marked by a cord with one knot. It follows that, if, say, five knots of the line run out in 28 seconds, the ship has gone 5×47 ft. in that time, or is moving at the rate of 5×6080 ft. (=five nautical miles) an hour; hence the common use of knot as equivalent to a nautical mile. In the log-glass the time is measured by running sand, which, however, is apt to be affected by the humidity of the atmosphere. Sometimes a 30-second glass is used instead of a 28-second one, and the intervals between the knots on the log-line are then made 50 ft. 7 in. instead of 47 ft. 3 in. For speeds over six knots a 24-second glass is employed, and the speed indicated by the log-line is doubled.

The log-line, after being well soaked, stretched and marked with knots, is wound uniformly on the log-reel, to which its inner end is securely fastened. To "heave the log," a man holds the log-reel over his head (at high speeds the man and portable reel are superseeded by a fixed reel and a winch fitted with a brake), and the officer places the peg in the log-ship, which he then throws clear and to windward of the ship, allowing the line to run freely out. When the bunting at the end of the stray line passes his hand, he calls to his assistant to turn the glass, and allows the line to pay out freely. When all the sand has run through, the assistant calls "Stop!" when the log-line is quickly nipped, the knots counted, and the intermediate portion estimated. The strain on the log-line when the log-line is kept causes the peg to be withdrawn from it, and the log-line is readily hauled in. In normal circumstances the log is hove every hour. In a steam vessel running at high speed on an ocean route, with engines working smoothly and uniformly, a careful officer with correct line and glass can obtain very accurate results with the common log.

Ground Log.—In the deltas of shoal rivers, with a strong tide or current and no land visible, a ½ lb lead is substituted for the log-ship, the lead rests on the bottom, and the speed is obtained in a manner similar to that previously described. Such a "grounded log" would record the actual speed over the ground, and in addition, when the log-line is being hauled in, it will show the real course the ship is making over the ground.

Patent Log.—The screw or rotatory log of Edward Massey, invented in 1802, came into general use in 1846 and continued until 1861. The registering wheel-work was contained in a shallow rectangular box (fig. 2), with a float plate on its upper side, carrying three indicating dials, recording respectively fractions, units and tens of miles (up to a hundred). The rotator was connected to the log by a rope 6 ft. in length, actuating a universal joint on the first spindle of the register; it consisted of an air-tight thin metal tube with a coned fore-end, carrying flat metal vanes set at an angle. Alexander Bain in 1847 suggested enclosing the wheelwork in the rotator. In Thomas Walker's harpoon or frictionless log, introduced in 1861, the wheelwork was enclosed in a cylindrical case of the same diameter as the body of the rotator or fan, and the latter was brought close up to the register, forming a compact machine and avoiding the use of the 6-ft. line. Two years later a heart-shaped float plate was attached to the case, and the log called the At Harpoon ship log (fig. 3). The log should be washed in fresh water when practicable, to prevent oxidation of the wheels, and be lubricated with suitable oil through a hole in the case.

These logs were towed from the ship, but with quick passages and well surveyed coasts, the need arose for a patent log which could be readily consulted from the deck, and from which the distance run under varying speeds could be quickly ascertained. To meet this requirement, Walker in 1878 introduced the Cherub...
log (fig. 4), a taffrail one, which, however, is not as a rule used for speeds over 18 knots. Owing to the increased friction produced by a rotator making approximately 900 revolutions per mile, towed at the end of a line varying from 40 fathoms for a 12-knot speed to 60 fathoms for 20 knots, the pull of the line and rotator is borne by coned rollers, having their outlines tapering to a common point in their rotation, thus giving a broad rolling surface. Strong worms and wheels are substituted for the light clockwork. In fig. 4 the shoe H is secured to the taffrail, and the rotator in the water is hooked to the eye of the spindle M by the hook D. The case A contains the registering wheelwork and a sounding bell. The half gimbal B pivoting in the socket of the base C allows the register to receive the strain in the direct line. The bearings and rollers are lubricated with castor oil every twelve hours through holes in the sliding case E, and can be examined by unscrewing the case E and the eye M. When not in use, the register is removed from the shoe by lifting a small screw button near C. The tow line is usually plaited, and to avoid a knot close to the rotator, the latter is secured to the former by a knot inside an egg-shaped shell (fig. 5, Neptune pattern).

Walker's Neptune log (fig. 6) is used for vessels of high speed. Case A contains the wheelwork, and case E the spindle and steel ball bearings; in each case are openings, closed by sliding tubes, for examination and lubrication. In fig. 6 the cases A and E are shown open. Fig. 7 shows the dial plate. In fig. 8 the ball bearings are shown unscrewed from the body of the log, with eye, cap and spindle. They consist of two rows of balls rolling in two pairs of V races or grooves. The outer pair receive the strain of the rotator, and the inner are for adjustment and to prevent lateral movement. The balls and races are enclosed in a skeleton cage (fig. 9) unscrewing from the cap F (fig. 6) for cleaning or renewal; the adjustment of the bearings is made by screwing up the cage cap b, locked by a special washer and the two screws a, a (figs. 8, 9). If the outer races become worn, the complete cage and bearings are reversed; the strain of the line is then transferred to what had previously been the inner with practically unworn balls and races. It is for this purpose that the skeleton cage is screwed internally at both ends, fitting a screwed ring inside the cap F (fig. 6). To enable the indications of the log register on the taffrail to be recorded in the chart room or any other part of the vessel as desired, a chart room electric register has been introduced. By means of an electric installation between the log register and the electric register in the chart room, every tenth of a mile indicated by the former is recorded by the latter.

Walker's Rocket log (fig. 10) is a taffrail one, with bearings of hardened steel, and is intended to be slung or secured to the taffrail by a line; the gimbal pattern has a fitting for the deck. In log register, the movement of the line owing to its length becomes spasmodic and jittery, increasing the vibration and friction; to obviate this governor or fly-wheel is introduced, the hook of the tow line K (fig. 11) and the eye of the register M being attached to the governor. Fig. 11 represents the arrangement fitted to the Neptune log; with the Cherub log, a small piece of line is introduced between the governor and the eye.

The two principal American taffrail logs are the Negus and Bliss (Messrs Norie and Wilson). The former bears a general resemblance to the Cherub log, but the dial plate is horizontal and the faces turn upwards. The main shaft bearings are in two sets and composed of steel balls running in steel cones and cups; the governor is an iron rod about 16 in. long, with 1 in. balls at the extremities. The Bliss resembles the Rocket log in shape, and is secured to the taffrail by a rope or sling. A governor is not employed. The blades of the rotator are adjustable, being fitted into its tube or body by slits and holes and then soldered. The outer ends of the blades are slit (fig. 12) to form two tongues, and with the wrench (fig. 12) the angle of the pitch can be altered. All patent logs have errors, the amounts of which should be ascertained by shore observations when passing a well surveyed coast in tideless waters on a calm day. Constant use, increased friction (more especially at high speeds), and damage to the rotator will alter an ascertained log error; head or following seas, strong winds, currents and tidal streams also affect the correctness.

A Log Book is a marine or sea journal, containing, in the British navy, the speed, course, leeway, direction and force of the wind, state of the weather, and barometric and thermometric observations. Under the heading "Remarks" are noted (for vessels with sail power) making, shortening and trimming sails; and (for all ships) employment of crew, times of passing prominent landmarks, altering of course, and any subject of interest and importance. The deck log book, kept by the officers of the watch, is copied into the ship's log book by the navigating
officer, and the latter is an official journal. In steam vessels a rough and fair engine room register are kept, giving information with regard to the engines and boilers.

In the British mercantile marine all ships (except those employed exclusively in trading between ports on the coasts of Scotland) are compelled to keep an official log book in a form approved by the Board of Trade. A mate's log book and engine room register are not compulsory, but are usually kept. (J.W.D.)

LOGAN, JOHN (c. 1725-1780), also known as Thames, American Indian chief, a Cayuga by birth, was the son of Shikellamy, a white man who had been captured when a child by the Indians, had been reared among them, and had become chief of the Indians living on the Shamokin Creek in what is now Northumberland county, Pennsylvania. The name Logan was given to the son in honour of James Logan (1674-1751), secretary of William Penn and a steadfast friend of the Indians. John Logan lived for some time near Reedsville, Penn., and removed to the banks of the Ohio river about 1770. He was not technically a chief, but acquired great influence among the Shawnees, into which tribe he married. He was on good terms with the whites until April 1774, when friction having arisen between the Indians and the whites, a band of marauders, led by one Great-house, attacked and murdered several Indians, including, it appears, Logan's sister and possibly one or more other relatives. Believing that Captain Michael Cresap was responsible for this murder, Logan sent him a declaration of hostilities, the result of which was the bloody conflict known as Lord Dunmore's War. Logan refused to join the Shawnee chief, Cornstalk, in meeting Governor Dunmore in a peace council after the battle of Point Pleasant, but sent him a message which has become famous as an example of Indian eloquence. The message seems to have been given by Logan to Colonel John Gibson, by whom it was delivered to Lord Dunmore. Thomas Jefferson first called general attention to it in his Notes on Virginia (1787), where he quoted it and added: "I may challenge the whole orations of Demosthenes and Cicero, and of any more eminent orator, if Europe has furnished more eminent, to produce a single passage superior to it." Logan became a victim of drink, and in 1778 was killed near Lake Erie by his nephew whom he had attacked. There is a monument to him in Fair Hill Cemetery, near Auburn, New York.

Brantz Mayer's Tahgahjute, or Logan the Indian and Captain Michael Cresap (Baltimore, 1853, 2nd ed., Albany, 1867) defends Captain Cresap against Jefferson's charges, and also questions the authenticity of Logan's message, about which there has been considerable controversy, though its actual wording seems to be that of Gibson rather than of Logan.

LOGAN, JOHN (1748-1788), Scottish poet, was born at Soutra, Midlothian, in 1748. His father, George Logan, was a farmer and a member of the Burgher sect of the Secession church. John Logan was sent to Musselburgh grammar school, and in 1762 to the university of Edinburgh. In 1768-1769 he was tutor to John, afterwards Sir John, Sinclair, at Ulbster, Caithness, and in 1770, having left the Secession church, he was licensed as a preacher by the presbytery of Haddington. In 1771 he was presented to the charge of South Leith, but was not ordained till two years later. On the death of Michael Bruce (q.v.) he obtained that poet's MSS. with a view to publication. In 1770 he published Poems on Several Occasions, by Michael Bruce with a preface, in which, after eulogizing Bruce, who had been a fellow student of his, he remarked that "to make up a miscellany some poems written by different authors are inserted, all of them originals, and none of them destitute of merit. The reader of taste will easily distinguish them from those of Mr Bruce, without their being particularized by any mark." Logan was an active member of the committee of the General Assembly of the Church of Scotland which worked from 1777 to 1781 at revising the "Translations and Paraphrases" for public worship, in which many of his hymns are printed. In 1770-1781 he delivered a course of lectures on the philosophy of history at St Mary's Chapel, Edinburgh. An analysis of these lectures, Elements of the Philosophy of History (1781), bears striking resemblance to A View of Ancient History (1787), printed as the work of Dr W. Rutherford, but thought by Logan's friends to be his. In 1781 he published his own Poems, including the "Ode to the Cuckoo" and some other poems which had appeared in his volume of Michael Bruce's poems, and also his own contributions to the Paraphrases. His other publications were An Essay on the Manners and Governments of Asia (1782), Rummannede, a tragedy, (1783), and A Review of the Principal Charges against Warren Hastings (1788). His connexion with the theatre gave offence to his congregation at South Leith; he was impertinent in his habits, and there was some local scandal attached to his name. He resigned his charge in 1786, retaining part of his stipend, and proceeded to London, where he became a writer for the English Review. He died on the 28th of December 1788. Two posthumous volumes of sermons appeared in 1790 and 1791. They were very popular, and were reprinted in 1810. His Poetical Works were printed in Dr Robert Anderson's British Poets (vol. xi., 1795), with a life of the author. They were reprinted in similar collections, and separately in 1855.

Logan was accused of having appropriated in his Poems (1781) verses written by Michael Bruce. The statements of John Birrell and David Pearson on behalf of Bruce were included in Dr Anderson's Life of Logan. The charge of plagiarism has been revived from time to time, notably by Dr W. Mackelvie (1857) and Mr James Mackenzie (1903). The whole controversy has been marked by strong partisanship. The chief points against the maker of the suppression of Logan's name, his MSS. and some proved cases of plagiarism in his sermons and hymns. Even in the beautiful "Bras of Yarrow" one of the verses is borrowed directly from an old border ballad. The traditional evidence in favour of Bruce's authorship of the "Ode to the Cuckoo" can hardly be set aside, but Dr Robertson of Dalmeny, who was Logan's literary executor, stated that he had gone over the MSS. procured at Kinnesswood with Logan. Logan's authorship of the poems in dispute is defended by David Logan: Ode to the Cuckoo: Letter to J. C. Sharp, LL.D. (1873); by John Small in the British and Foreign Evangelical Review (July, 1877, April and October, 1879); and by R. Small in two papers (ibid., 1879). See also Bruce, Michael.

LOGAN, JOHN ALEXANDER (1826-1886), American soldier and political leader, was born in what is now Murphysboro, Jackson county, Illinois, on the 9th of February 1826. He had no schooling until he was fourteen; he then studied for three years in Shiloh College, served in the Mexican War as a lieutenant of volunteers, studied law in the office of an uncle, graduated from the Law Department of Louisville University in 1851, and practised law with success. He entered politics as a Democrat, was elected county clerk in 1849, served in the State House of Representatives in 1856-1858 and in 1857, and for a time, during the interval, was prosecuting attorney of the Third Judicial District of Illinois. In 1858 and 1860 he was elected as a Democrat to the National House of Representatives. Though unattached and unenlisted, he fought at Bull Run, and
then returned to Washington, resigned his seat, and entered the Union army as colonel of the 31st Illinois Volunteers, which he organized. He was regarded as one of the ablest officers who entered the army from civil life. In Grant's campaigns terminating in the capture of Vicksburg, which city Logan's division was the first to enter and of which he was military governor, he rose to the rank of major-general of volunteers; in November 1863 he succeeded Sherman in command of the XV. Army Corps; and after the death of McPherson he was in command of the Army of the Tennessee at the battle of Atlanta. When the war closed, Logan resumed his political career as a Republican, and was a member of the National House of Representatives from 1867 to 1871, and of the United States Senate from 1871 until 1877 and again from 1879 until his death, which took place at Washington, D.C., on the 26th of December 1886. He was always a violent partisan, and was identified with the radical wing of the Republican party. In 1868 he was one of the managers in the impeachment of President Johnson. His war record and his great personal following, especially in the Grand Army of the Republic, contributed to his nomination for Vice-President in 1884 on the ticket with James G. Blaine, but he was not elected. His impetuous oratory, popular on the platform, was less adapted to the halls of legislation. He was commander-in-chief of the Grand Army of the Republic from 1868 to 1871, and in this position successfully urged the observance of Memorial or Decoration Day, an idea which probably originated with him. He was the author of The Great Conspiracy: Its Origin and History (1886), a partisan account of the Civil War, and of The Volunteer Soldier of America (1887). There is a fine statue of him by S. Gaudens in Chicago.

The best biography is that by George F. Dawson, The Life and Services of Gen. John A. Logan, as Soldier and Statesman (Chicago and New York, 1887).

LOGAN, SIR WILLIAM EDMOND (1798-1875), British geologist, was born in Montreal on the 20th of April 1798, of Scottish parents. He was educated partly in Montreal, and subsequently at the High School and university of Edinburgh, where Robert Jameson did much to excite his interest in geology. He was in a business house in London from 1817 to 1830. In 1830 he took charge of a colliery and some copper-smelting works, and here his interest in geology found abundant scope. He collected a great amount of information respecting the South Wales coal-field; and his data, which he had depicted on the 1-in. ordnance survey map, were generously placed at the disposal of the geological survey under Sir H. T. de la Beche and fully utilized. In 1840 Logan brought before the Geological Society of London his celebrated paper “On the character of the beds of clay lying immediately below the coal-seams of South Wales, and on the occurrence of coal-boulders in the Pennant Grit of that district.” He then pointed out that each coal-seam rests on an under-clay with rootlets of Stigmantia, and he expressed his opinion that the under-clay was the old soil in which grew the plants from which the coal was formed. To confirm this observation he visited America in 1841 and examined the coal-fields of Pennsylvania and Nova Scotia, where he found the under-clay almost invariably present beneath the seams of coal. In 1842 he was appointed to take charge of the newly established geological survey of Canada, and he continued as director until 1869. During the earlier years of the survey he had many difficulties to surmount and privations to undergo, but the work was carried on with great tact and energy, and he spared no pains to make his reports trustworthy. He described the Laurentian rocks of the Laurentian mountains in Canada and of the Adirondacks in the state of New York, pointing out that they comprised an immense series of crystalline rocks, gneiss, mica-schist, quartzite and limestone, more than 30,000 ft. in thickness. The series was rightly recognized as representing the oldest type of rocks on the globe, but it is now known to be a complex of highly altered sedimentary and intrusive rocks; and the supposed oldest known fossil, the Eosorn described by Sir J. W. Dawson, is now regarded as a mineral structure. Logan was elected F.R.S. in 1851, and in 1866 was knighted. In the same year he was awarded the Wollaston medal by the Geological Society of London for his researches on the coal-strata, and for his excellent geological map of Canada. After his retirement in 1869, he returned to England, and eventually settled in South Wales. He died at Castle Malgwyn in Pembroke-shire, on the 22nd of June 1875.

See the Life, by B. J. Harrington (1883).

LOGAN, a city and the county-seat of Cache county, Utah, U.S.A., on the Logan river, about 70 m. N. of Salt Lake City. Pop. (1900) 5451 (1460 foreign-born); (1910) 7522. It is served by the Oregon Short Line railroad. It lies at the mouth of Logan Cañon, about 4500 ft. above the sea, and commands magnificent views of the Wasatch Mountains and the fertile Cache Valley. At Logan is a temple of the Latter-Day Saints (or Mormons), built in 1883, and the city is the seat of the Agricultural College of Utah, of Brigham Young College, and of New Jersey Academy (1878), erected by the women of the Synod of New Jersey and managed by the Woman's Board of Home Missions of the Young Women's Christian Association. The Agricultural College was founded in 1888 and opened in 1890; an agricultural experiment station is connected with it and the institution comprises schools of agriculture, domestic science and arts, commerce, mechanic arts and general science. Six experiment stations in different parts of the state and a central experimental farm near St George, Washington county, were in 1908 under the direction of the experiment station in Logan. Brigham Young College was endowed by Brigham Young in 1877 and was opened in 1878; it offers courses in the arts, theology, civil engineering, music, physical culture, domestic science, nurse training and manual training. Logan has various manufactures, and is the trade centre for a fertile farming region. The municipality owns and operates its water works and its electric lighting plant. Logan was settled in 1859 and first incorporated in 1866.

LOGANSPORT, a city and the county-seat of Cass county, Indiana, U.S.A., on the Wabash river, at the mouth of the Eel river, about 65 m. N. by W. of Indianapolis and 117 m. S. by E. of Chicago. Pop. (1900) 16,304, of whom 14,132 were foreign-born, (1910) 19,050. It is served by six divisions of the Pittsburg, Cincinnati, Chicago & St Louis; two divisions of the Vandalia (Pennsylvania Lines), and the Wabash railways, and by electric interurban lines. The city is the seat of the Northern Indiana Hospital for the Insane (1888), and has a public library, and a hospital (conducted by the Sisters of St Joseph). Among the principal buildings are the court house, a Masonic temple, an Odd Fellows' temple, and buildings of the Order of Elks, of the Knights of Pythias, and of the fraternal order of Eagles. Situated in the centre of a rich agricultural region, Logansport is one of the most important grain and produce markets in the state. The Wabash and the Eel rivers provide good water power, and the city has various manufactures, besides the railway repair shops of the Vandalia and of the Pittsburg, Cincinnati, Chicago & St Louis railways. The value of the city's factory product increased from $2,100,394 in 1900 to $2,955,621 in 1905, or 40.7%. Limestone, for use in the manufacture of iron, is quarried in the vicinity. The city owns and operates the various works and the electric-lighting plant. Logansport was platted in 1828, was probably named in honour of a Shawnee chief, Captain Logan (d. 1812), became the county-seat of Cass county in 1829, and was chartered as a city in 1838.

LOGAR, a river and valley of Afghanistan. The Logar river drains a wide tract of country, rising in the southern slopes of the Sanghak range and receiving affluents from the Kharwar hills, N.E. of Ghazni. It joins the Kabul river a few miles below the city of Kabul. The Logar valley, which is watered by its southern affluents, is rich and beautiful, about 40 m. long by 12 wide, and highly irrigated throughout. Lying in the vicinity of the capital, the district contributes largely to its food-supply. The valley was traversed in 1879 by a brigade under Sir F. (afterwards Lord) Roberts.
LOGARITHM (from Gr. λογός, word, ratio, and ἀριθμός, number), in mathematics, a word invented by John Napier to denote a particular kind of function discovered by him, and which may be defined as follows: if \( a, m, n \) are any three quantities satisfying the equation \( a^m = n \), then \( a \) is called the base, and \( n \) is said to be the logarithm of \( m \) to the base \( a \). This relation between \( x, a, m, \) may be expressed also by the equation \( x = \log_a m \).

Properties. — The principal properties of logarithms are given by the equations

\[
\log_a (mn) = \log_a m + \log_a n, \quad \log_a (m/n) = \log_a m - \log_a n, \quad \log_a m^r = r \log_a m, \quad \log_a 1 = 0.
\]

which may be readily deduced from the definition of a logarithm.

It follows from these equations that the logarithm of the product of any number of quantities is equal to the sum of the logarithms of the quantities, that the logarithm of the quotient of two quantities is equal to the logarithm of the numerator diminished by the logarithm of the denominator, that the logarithm of the \( r \)th power of a quantity is equal to \( r \) times the logarithm of the quantity, and that the logarithm of the \( r \)th root of a quantity is equal to \( (1/r) \)th of the logarithm of the quantity.

Logarithms were originally invented for the sake of abbreviating arithmetical calculations, as by their means the operations of multiplication and division may be replaced by those of addition and subtraction, and the operations of raising to powers and extraction of roots by those of multiplication and division.

For the purpose of thus simplifying the operations of arithmetic, the base is taken to be 10, and use is made of tables of logarithms in which the values of \( x \), the logarithm, corresponding to values of \( m \), the number, are tabulated. The logarithm is also a function of frequent occurrence in analysis, being regarded as a known and recognized function like \( \sin x \) or \( \tan x \); but in mathematical investigations the base generally employed is not 10, but a certain quantity usually denoted by the letter \( e \), of value 2.71828 18284 ...

Thus in arithmetical calculations if the base is not expressed it is understood to be 10, so that \( \log_{10} m \) denotes \( \log m \); but in analytical formulae it is understood to be \( e \).

The logarithms to base 10 of the first twelve numbers to 7 places of decimals are

\[
\begin{align*}
\log 1 & = 0.0000000, \\
\log 2 & = 0.3010300, \\
\log 5 & = 0.6989750, \\
\log 9 & = 0.9542425.
\end{align*}
\]

The meaning of these results is that

\[
1 = 10^0, \quad 2 = 10^{0.3010300}, \quad 3 = 10^{0.4771213}, \quad 5 = 10^{0.6989750}, \quad 10 = 10^1.
\]

The integral part of a logarithm is called the index or characteristic, and the fractional part the mantissa. When the base is 10, the logarithms of all numbers in which the digits are the same, no matter where the decimal point may be, have the same mantissa; thus, for example,

\[
\begin{align*}
\log 2.5613 & = 0.4084604, \\
\log 25.613 & = 1.4084604, \\
\log 2561300 & = 6.4084604, \ldots.
\end{align*}
\]

In the case of fractional numbers (i.e. numbers in which the integral part is 0) the mantissa is still kept positive, so that, for example,

\[
\log -2.5613 = 10 - 0.4084604 = -0.5915396, \quad \log -0.0025613 = 3.4084604, \ldots.
\]

The minus sign being usually written over the characteristic, and not before it, to indicate that the characteristic only, and not the whole expression, is negative; thus

\[
\log 2.5613 = 10 - 0.4084604 = 9.5915396, \quad \log -0.0025613 = 3.4084604, \ldots.
\]

The fact that when the base is 10 the mantissa of the logarithm is independent of the position of the decimal point in the number affords the chief reason for the choice of 10 as base. The explanation of this property of the base 10 is evident, for a change in the position of the decimal points amounts to multiplication or division by some power of 10, and this corresponds to the addition or subtraction of some integer in the case of the logarithm, the mantissa therefore remaining intact. It should be mentioned that in most tables of trigonometrical functions, the number 10 is added to all the logarithms in the table in order to avoid the use of negative characteristic, so that the characteristic 9 denotes in reality 1, 8 denotes 2, 10 denotes 0, &c. Logarithms thus increased are frequently referred to for the sake of distinction as tabular logarithms, so that the tabular logarithm 9 = 10.

In tables of logarithms of numbers to base 10 the mantissas only is in general tabulated, as the characteristic of the logarithm of a number can always be written down at sight, the rule being that, if the number is greater than unity, the characteristic is less by unity than the number of digits in the integral portion of it, and that if the number is less than unity the characteristic is negative, and is greater by unity than the number of ciphers between the decimal point and the first significant figure.

It follows very simply from the definition of a logarithm that

\[
\log_a b \times \log_b c = 1, \quad \log_a m = \log_a m \times (1/\log_b b).
\]

The second of these relations is an important one, as it shows that from a table of logarithms to base \( a \), the corresponding table of logarithms to base \( b \) may be deduced by multiplying all the logarithms in the former by the constant multiplier \( 1/\log_b b \), which is called the modulus of the system whose base is \( b \) with respect to the system whose base is \( a \).

The two systems of logarithms for which extensive tables have been calculated are the Napierian, or hyperbolic, or natural system, of which the base is \( e \), and the Briggsian, or decimal, or common system, of which the base is 10; and we see that the logarithms in the latter system may be deduced from those in the former by multiplication by the constant multiplier \( 1/\log_{10} e \), which is the modulus of the common system of logarithms.

The numerical value of this modulus is 0.43429 4481 0925 12865 11259 \ldots, and the value of its reciprocal, \( 1/\log_{10} e \) (by multiplication by which Briggsian logarithms may be converted into Napierian logarithms) is 2.30258 5092 9445 66081 79914 \ldots

The quantity denoted by \( e \) is the series

\[
1 + 1/2 + 1/2^2 + 1/2^3 + 1/2^4 + \ldots
\]

the numerical value of which is

\[
2.71828 18284 59045 23536 02874 \ldots
\]

The logarithmic Function. — The mathematical function \( \log x \) or \( \log_{10} x \) is one of the smallest group of transcendental functions, consisting only of the circular functions (direct and inverse) \( \sin x, \cos x, \ldots \), \( \arcsin x, \arccos x, \ldots \), \( \log x \) and \( e^x \), which are universally treated in analysis as known functions. The notation \( \log x \) is generally employed in English and American works, but on the continent of Europe writers usually denote the function by \( \log \) or \( \lg \) \( x \).

The logarithmic function is most naturally introduced by means of the equation

\[
\log x = \int_{0}^{x} \frac{dt}{x} \quad (x > 0).
\]

This equation defines \( \log x \) for positive values of \( x \); if \( x < 0 \) the formula ceases to have any meaning. Thus \( \log x \) is the integral function of \( x^{1/2} \), and it can be shown that \( \log x \) is a new transcendental, not expressible in finite terms by means of functions such as algebraical or circular functions. A connexion with the circular functions, however, appears later when the definition of \( \log x \) is extended to complex values of \( x \).

A relation which is of historical interest connects the logarithmic function with the quadrature of the hyperbola, for, by considering the equation of the hyperbola in the form \( xy = \text{const.} \), it is evident that the area included between the arc of a hyperbola, its nearest asymptote, and two ordinates drawn parallel to the other asymptote from points on the first asymptote distant \( a \) and \( b \) from their point of intersection, is proportional to \( \log b/a \).

The following fundamental properties of \( \log x \) are readily deduced from the definition

\[
(1) \quad \log xy = \log x + \log y,
(2) \quad \log (a^x) = x \log a,
(3) \quad \log (1+a^x) = x - x^2/2 + x^3/3 - x^4/4 + \ldots
\]

The series, however, is convergent for real values of \( x \) only when \( x \) lies between \( +1 \) and \( -1 \). Other formulae which are deductible from this
logarithms to the base e where \( e = 2.7182818 \ldots \); the relation between N (a sine) and L its logarithm, as defined in the Canonis Descriptio, being \( N = \log_{e}N/10 \), so that (ignoring the factors 10\(^2\)), the effect of which is to render sines and logarithms integral to \( 7 \) figures, the base is \( e^{1/7} \). Napier's logarithms decrease as the sines increase. If \( l \) denotes the logarithm to base \( e \) (that is, the so-called “Napierian” or hyperbolic logarithm and L denotes, as above, “Napier's” logarithm, the connection between \( l \) and \( L \) is expressed by

\[
L = 100 \log_{e} l - 10l + \varepsilon \times 10^{-4/\pi^{2}}
\]

Napier's work (which will henceforth in this article be referred to as the Descriptio) immediately on its appearance in 1614 attracted the attention of perhaps the two most eminent English mathematicians then living—Edward Wright and Henry Briggs. The former translated the work into English; the latter was concerned with Napier in the change of the logarithms from those originally invented to decimal or common logarithms, and it is to him that the original calculation of the logarithmic tables now in use is mainly due. Both Napier and Wright died soon after the publication of the Descriptio, the date of Wright's death being 1617 and that of Napier 1615. Edward Wright, who was a fellow of Caius College, Cambridge, occupies a conspicuous place in the history of navigation. In 1599 he published Certaine errors in Navigation detected and corrected, and he was the author of other works; to him also is chiefly due the invention of the method known as Mercator's sailing. He at once saw the value of logarithms as an aid to navigation, and lost no time in preparing a translation, which he submitted to Napier himself. The preface to Wright's edition consists of a translation of the preface to the Descriptio, together with the addition of the following sentences written by Napier himself: “But now some of our countrymen in this Island well affected to these studies, and the more publick good, procured a most learned Mathematician to translate the same into our vulgar English tongue, who after he had finished it, sent the Copy of it to me, to bee seen and considered on by myself. I having most willingly and gladly done the same, finde it to bee most exact and precisely conformable to my minde and the original. Therefore it may please you who are inclined to these studies, to receive it from me and the Translator, with as much good will as we recommend it unto you.” There is a short “preface to the reader” by Briggs, and a description of a triangular diagram invented by Wright for finding the proportional parts. The table is printed to one figure less than in the Descriptio. Edward Wright died, as has been mentioned, in 1615, and his son, Samuel Wright, in the preface states that his father “gave much commendation of this work (and often in my hearing) as of very great use to mariners”; and with respect to the translation he says that “shortly after he had it returned out of Scotland, it pleased God to call him away afore he could publish it.” The translation was published in 1616. It was also reissued with a new title-page in 1618.

Henry Briggs, then professor of geometry at Gresham College, London, and afterwards Savilian professor of geometry at Oxford, welcomed the Descriptio with enthusiasm. In a letter to Archbishop Usher, dated Gresham House, March 10, 1615, he wrote, “Napper, lord of Markinston, hath set my head and hands to a work with his new and admirable logarithms. I hope to see him this summer, if it please God, for I never saw book which pleased me better, or made me more wonder. I purpose to discourse with him concerning eclipses, for what is there which we may not hope for at his hands?” and he also states that he was wholly labouring to invent a shorthand table of logarithms lately discovered.” Briggs accordingly visited Napier in 1615 and stayed with him a week. He brought with him some

Dr Thomas Smith thus describes the ardour with which Briggs studied the Descriptio: “Hunc in deliciis habuit, in sinu, in manibus, in pectore gestavit, oculisque avidissimum, et mente attentissimum, iterum iterumque perigit, ...” Viaæ querundam eruditissimorum et illustrium virorum (London, 1725).

William Lilly's account of the meeting of Napier and Briggs at Merchiston is quoted in the article NAPIER.
LOGARITHM

calculations he had made, and suggested to Napier the advantages that would result from the choice of 10 as a base, an improvement which he had explained in his lectures at Gresham College, and on which he had written to Nuyts. Napier said that he had already thought of the change, and pointed out a further improvement, viz., that the characteristics of numbers greater than unity should be positive and not negative, as suggested by Briggs. In 1616 Briggs again visited Napier and showed him the work he had accomplished, and, he says, he would gladly have paid him a third visit in 1617 had Napier's life been spared.

Briggs's Logarithrhorum chilias prima, which contains the first published table of decimal or common logarithms, is only a small octavo tract of sixteen pages, and gives the logarithms of numbers from unity to 1000 to 14 places of decimals. It was published, probably privately, in 1617, after Napier's death, and there is no author's name, place or date. The date of publication is, however, fixed at 1617 by a letter from Sir Henry Bourchier to Usber, dated December 6, 1617, containing the passage—"Our kind friend, Mr Briggs, hath lately published a supplement to the most excellent tables of logarithms, which I presume he has sent to you." Briggs's tract of 1617 is extremely rare, and has generally been ignored or incorrectly described. Hutton erroneously states that it contains the logarithms to 8 places, and is followed by most writers. There is a copy in the British Museum.

Briggs continued to labour assiduously at the calculation of logarithms, and in 1624 published his Arithmetica logarithmica, a folio work containing the logarithms of the numbers from 1 to 20,000, and from 90,000 to 100,000 (and in some copies to 101,000) to 14 places of decimals. The table occupies 300 pages, and there is an introduction of 88 pages relating to the mode of calculation, and the applications of logarithms.

There was thus left a gap between 20,000 and 90,000, which was filled up by Adrian Vlacq (or Ulaccus), who published at Gouda, in Holland, in 1628, a table containing the logarithms of the numbers from unity to 100,000 to 10 places of decimals. Having calculated 70,000 logarithms and copied only 30,000, Vlacq would have been quite entitled to have called his a new work. He designates it, however, only a second edition of Briggs's Arithmctica logarithmica, the title running Arithmctica logarithmica sive Logarithrhorum Chilias centum, . . . editio secunda aucto per Adrianum Vlacq, Goudannum. This table of Vlacq's was published, with his introduction prefixed, at London in 1628 in the title Logarithmica Arithmeticae logarhythmorum tractatus, London, printed by George Miller, 1631. There are also copies with the title-page and introduction in French and in Dutch (Gouda, 1628).

Briggs had himself been engaged in filling up the gap, and in a letter to John Pell, written after the publication of Vlacq's work, and dated October 25, 1628, he says:—

"My desire was to have those chilides that are wanting between 20 and 90 calculated and printed, and I had done them all almost by my selfe, and by some frendes whom my rules had sufficiently informed, and by agreement the business was conveniently parted amongst us; but I am easl of that charge and care by one Adrian Vlacque, an Hollander, who had done all the whole hundred chilides and printed them in Latin, Dutch and French, 1000 books, and 13 languages, and had put them almost well. But he had cutt off of my figures throughout; and had left out my dedication, and to the reader, and two chapters the 12 and 13, in the rest he hath not varied from me at all."

The original calculation of the logarithms of numbers from unity to 101,000 was thus performed by Briggs and Vlacq between 1615 and 1628. Vlacq's table is that from which all the hundreds of tables of logarithms that have subsequently appeared have been derived. It contains of course many errors, which were gradually discovered and corrected in the course of the next two hundred and fifty years.

The first calculation or publication of Briggsian or common logarithms of trigonometrical functions was made in 1620 by Edmund Gunter, who was Briggs's colleague as professor of

astronomy in Gresham College. The title of Gunter's book, which is very scarce, is Canon triangulorum, and it contains logarithmic sines and tangents for every minute of the quadrant to 8 places of decimals.

The next publication was due to Vlacq, who appended to his logarithms of numbers in the Arithmetica logarithmica of 1628 a table giving log sines, tangents and secants for every minute of the quadrant to 10 places; there were obtained by calculating the logarithms of the natural sines, &c. given in the Thesaurus mathematicus of Pitiscus (1616).

During the last years of his life Briggs devoted himself to the calculation of logarithmic sines, &c. and at the time of his death in 1631 he had all but completed a logarithmic canon to every hundredth of a degree. This work was published by Vlacq at his own expense at Gouda in 1633, under the title Trigonometria Britannica. It contains log sines (to 14 places) and tangents (to 10 places), besides natural sines, tangents and secants, at intervals of a hundredth of a degree. In the same year Vlacq published at Gouda his Trigonometria artificialias, giving log sines and tangents to every 10 seconds of the quadrant to 10 places.

This work also contains the logarithms of numbers from unity to 20,000 taken from the Arithmetica logarithmica of 1628. The logarithm was afterwards divided into a centesimal division of the quadrant, and by dividing the degree into hundredths parts instead of into minutes, made a step towards a reformation in this respect, and but for the appearance of Vlacq's work the decimal division of the degree might have become recognized, as is now the case with the corresponding division of the second. The calculation of the logarithms not only of numbers but also of the trigonometrical functions is therefore due to Briggs and Vlacq; and the results contained in their four fundamental works—Arithmetica logarithmica (Briggs), 1624; Arithmetica logarithmica (Vlacq), 1628; Trigonometria Britannica (Briggs), 1633; Trigonometria artificialis (Vlacq), 1633—have not been superseded by any subsequent calculations.

In the preceding paragraphs an account has been given of the actual announcement of the invention of logarithms and of the calculation of the tables. It now remains to refer in more detail to the invention itself and to examine the claims of Napier and Briggs to the capital improvement involved in the change from Napier's original logarithms to logarithms to the base 10.

The Descriptio contained only an explanation of the use of the logarithms without the advantages of the manner in which the canon was constructed. In an "Admonitio" on the seventh page Napier states that, although in that place the mode of construction should be explained, he proceeds at once to the use of the logarithms, "ut praebitis prius usu, et rei utilitate, caetera aut magis placeat posthac edenda, aut minus saltam displicentio silentio sepulta." He awaits therefore the judgment and censure of the learned "pruisquam caetera in lucem temerar praltera lividorum detractioni exponantur"; and in an "Admonitio" on the last page of the book he states that he will publish the mode of construction of the canon "si huius inuenti usum eruditus graum fore intellexero." Napier, however, did not live to keep this promise. In 1617 he published a small work entitled Rabdologia relating to mechanical methods of performing multiplications and divisions, and in the same year he died.

The proposed work was published in 1619 by Robert Napier, his second son by his second marriage, under the title Mirifici logarithmorum canonis constructio. . . . It consists of two pages of theorems followed by sixty-seven pages of text. In the preface Robert Napier says that he has been induced by undoubted authority that the new invention is much thought of by the ablest mathematicians, and that nothing would delight them more than the publication of the mode of construction of the canon. He therefore issues the work to satisfy their desires, although, he states, it is manifest that it would have seen the light in a far more perfect state if his father could have put the finishing touches to it; and he mentions that, in the opinion of the best judges, his father possessed, among other most excellent gifts, in the highest degree the power of

1 It was certainly published after Napier's death, as Briggs mentions his "librum posthumum." This liber posthumus was the Constructio referred to later in this article.
explaining the most difficult matters by a certain and easy method in the fewest possible words.

It is important to notice that in the Constructio logarithms are called artificial numbers; and Robert Napier states that the work was composed several years (aigual annos) before Napier had invented the name logarithm. The Constructio therefore may have been written a good many years previous to the publication of the Descriptio in 1614.

Passing now to the invention of common or decimal logarithms, that is, to the transition from the logarithms originally invented by Napier to logarithms to the base 10, the first allusion to a change of system occurs in the “Admonitio” on the last page of the Descriptio (1614), the concluding paragraph of which is “Verum si huius inventi usum eruditis fore intellectuo, dabo fortasse brevi (Deo aspirante) rationem ac methodum aut hunc canonem emendandi; aut emendationem de novum, horum ut ita plurium Logistarum diligientia, limatior tandem ac exactior, quam unius opera fieri potuit, in lucem prodest. Nihil in veritate perfectum.” In some copies, however, this “Admonitio” is absent. In Wright’s translation of 1616 Napier has added the sentence—“But because the addition and subtraction of these former numbers may seem somewhat painful, I intend (if it shall please God) in a second Edition, to set out such Logarithms as shall make those numbers above written to fall upon decimal numbers, such as 100,000,000, 200,000,000, 300,000,000, &c., which are easy to be added or abated to or from any other number” (p. 19); and in the dedication of the Rabdologia (1617) he wrote “Quorum quidem Logarithmorum speciem aliquam multo praestantiorum nunc etiam invenimus, & creati methodum, unam cum eorum usu (si Deus longiore vitae & vae(uludum usum neglegere & utilissi eam, pars canoni supputationum, ob infirmam corporis nostrorum vae butenionis, viris in hoc studi genere versatis relinquimus: imprimit verò doctissimo viro D. Henrico Briggs Londini publico Geometriciae Professori, et amico mihi longé charissimo.”

Briggs in the short preface to his Logarithmorum chilias (1617) states the reason why his logarithms are different from those introduced by Napier “sperandum, ejus librum posthumum, abunde nobis propediem satisfactorum.” The “liber posthumus” was the Constructio (1610), in the preface to which Robert Napier states that he has added an appendix relating to another and more excellent species of logarithms, referred to by the inventor himself in the Rabdologia, and in which the logarithm of unity is 0. He also mentions that he has put over and et alii emendavit quod canoni negligentius; ipsum autem novi canonis supputationum, ob infirmam corporis nostrorum valetudinem, viris in hoc studi genere versatis relinquimus: imprimit verò doctissimo viro D. Henrico Briggs Londini publico Geometriciae Professori, et amico mihi longé charissimo.” Briggs, “qui novi hujus Canonis supputanda laborabo gravissimum, pro singulari amicitiae quia illi cum Patre meo L. M. intercessit, animo libentissimo in se suscipi; creandi methodo, et usuum explanatione Inventoris relocatis. Nunc autem ipso ex hâc vitâ evocato, totius negotii onus doctissimi Brigii humeris incumbere, et Sparta haec orandi illa sorte quidam obsidique vitetur.”

In the address prefixed to the Arithmetica logarithmica (1625) Briggs bids the reader not to be surprised that these logarithms are different from those published in the Descriptio:—

“Ego enim, cum meius auditoribus Londini, publice in Collegio Greshamensi horum doctrinam explicare; animadvertere multa futurarum commodior, si Logarithmus sinus totius servarentur 0 (ut in Canonim Napierico). Logarithmus autem partis decimae ejusdem sinus totius, nempe sinus 5 gradum, 44, m, 21, s, esset 1000000000. atque ea de re scripsissi statim ad ipsum authorum, et quamprimum per anni tempus, et vacationem a publico docendi munere licuit. proiectus sum Edinburgum; ubi humanissime ab eo acceptus haece per integram mensum. Cum autem inter nos de horum mutatione sermo habetur; ille se idem dudum sensisse, et cupivisse dicebat: verumtamen istor, quos jam paraverant edendis curasse, donec alios, si possem, aedificare fecerat. Nunc autem hoc tradere sumus. Istam autem mutationem ita faciendam censebat, ut o esset Logarithmus unitatis, et 1000000000 sinus totius: quod ego longe commodius esset non potui non agnoscere. Coepi igitur, ejus horatiorum, rejectoribus auctorum saevis ante totum socerum calculo scribo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequenti aestate iterum perfectum Edinburgum: ubi humanissime ab eo acceptus haece serbo cogitare; et sequeni
the case of both tables, the connexion between N a number and L its “logarithm” is:

\[ N = (e^L)^a \quad (\text{Napier}), \quad L = (10001)^b \quad (\text{Byrgius}), \]

viz. Napier gives logarithms to base \( e \), Byrgius gives anti-logarithms to base \( 10001 \).

There is indirect evidence that Napier was occupied with logarithms as early as 1594, for in a letter to P. Grégerus from Kepler, dated September 9, 1624 (Frisch’s *Kepler, vii*). 47, there occurs the sentence: “Nihil autem supra Neperianam rationem esse puto; etsi quidem Scotus quidam litteris ad Tychonem 1594 scriptis jam spem fecit Cananios illius Mirificum.” It is here distinctly stated that some Scotians in the year 1594, in a letter to Tycho Brahe, gave him some of the logarithms; and as Kepler joined Tycho after his departure from the island of Huen, and had been so closely associated with him in his work, he would be likely to be correct in any assertion of this kind.

In connexion with Kepler’s statement the following story, told by Anthony Wood in the *Athenae Oxonienses*, is of some importance:

“...it must be now known, that one Dr Craig, a Scotchman... coming out of Denmark into his own country, called upon Joh. Neper, Baron of Mercheston, near Edinburgh, and told him, among other discourses, of a new invention in Denmark by Longomontanus, as ‘it seemed’, to save the tedious multiplication and division in astronomical calculations. Neper being solicitous to know farther of him concerning this matter, he could give no other account of it than that it was by some triangular numbers, which, in an instant, he desired him at his return to call upon him again. Craig, after some weeks had passed, did so, and Neper then showed him a rude draught of what he called *Cananios mirabilis logarithmorum*. Which draught, with some alterations, he printing in 1614, it came forth into the hands of our author Briggs, and into those of Will. Oughtred, from whom the relation of this matter came.”

This story, though obviously untrue in some respects, gives valuable information by connecting Dr Craig with Napier and Longomontanus, who was Tycho Brahe’s assistant. Dr Craig was the son of Thomas Craig, who was one of the colleagues of Sir Archibald Napier, John Napier’s father, in the office of justice-depute. Between John Craig and John Napier a friendship sprang up which may have been due to their common taste for mathematics. There are extant three letters from Dr John Craig to Tycho Brahe, which show that he was on the most friendly terms with him. In the first letter, of which the date is not given, Craig says that Sir William Stuart has safely delivered him to “...about the beginning of last winter,” the book which he sent him. Now Mark Napier found in the library of the university of Edinburgh a mathematical work bearing a sentence in Latin which he translates, “...to Doctor John Craig of Edinburgh, in Scotland, a most illustrious man, highly gifted with various and excellent learning, professor of medicine, and exceedingly skilled in the mathematics, Tycho Brahe hath sent this gift, and with his own hand written this at Uraniburg, 2d November 1588.” As Sir William Stuart was sent to Denmark to arrange the preliminaries of King James’s marriage, and returned to Edinburgh on the 15th of November 1588, it would seem probable that this was the volume referred to by Craig. It appears from Craig’s letter, to which we may therefore assign the date 1589, that, five years before, he had made an attempt to reach Uraniburg, but had been baffled by the storms and rocks of Norway, and that ever since then he had been longing to visit Tycho. Now John Craig was physician to the king, and in 1590 James VI. spent some days at Uraniburg, before returning to Scotland from his matrimonial expedition. It seems not unlikely therefore that Craig may have accompanied the king in his visit to Uraniburg. In any case it is certain that Craig was a friend and correspondent of Tycho’s, and it is probable that he was the “Scotus quidam.”

We may infer therefore that as early as 1594 Napier had communicated to some one, probably John Craig, his hope of being able to effect a simplification in the processes of arithmetic. Everything tends to show that the invention of logarithms

1 Frisch’s *Kepler, opera omnia*, ii. 834. Frisch thinks Bramer possibly relied on Kepler’s statement quoted in the text (“Quibus forte confusus Kepleri verbi Ben. Bramer...”). See also vol. vii. p. 298.

2 The claims of Byrgius are discussed in Kästner’s *Geschichte der Mathematik*, ii. 375, and iii. 14; Monutca’s *Histoire des mathématiques*, ii. 10; Delambre’s *Histoire de l’astronomie moderne*, i. 560; de Morgan’s article on *Tables in the English Cyclopaedia*; Mark Napier’s *Memoirs of John Napier of Merchiston* (1834), p. 322, and Cantor’s *Geschichte der Mathematik*, ii. (1862), 662. See also Gieswald, *Justus Byrg als Mathematiker und dessen Einleitung in seine Logarithmen* (Danzig, 1856).
was the result of many years of labour and thought, and it seems that Napier had seen some prospect of success nearly twenty years before the publication of the *Descriptio*. It is very evident that no mere hint with regard to the use of proportional numbers could have been of any service to him, but it is possible that the news brought by Craig of the difficulties placed in the progress of astronomy by the labour of the calculations may have stimulated him to persevere in his efforts.

The "new invention in Denmark" to which Anthony Wood refers as having given the hint to Napier was probably the method of calculation called prosthaphaeresis (often written in Greek letters \(\pi\rho\sigma\theta\alpha\varphi\alpha\rho\eta\varepsilon\sigma\iota\zeta\)), which had its origin in the solution of spherical triangles. The method consists in the use of the formula

\[
\sin a \sin b = \frac{1}{2} \left[ \cos(a-b) - \cos(a+b) \right],
\]

by means of which the multiplication of two sines is reduced to the addition or subtraction of two tabular results taken from a table of sines; and, as such products occur in the solution of spherical triangles, the method affords the solution of spherical triangles in certain cases by addition and subtraction only. It seems to be due to Wittich of Breslau, who was assistant for a short time to Tycho Brahe; and it was used by them in their calculations. According to Craig, it is not known in Germany until 1610 when the calculation of one case by this prosthaphaeresis; and Justus Byrgius proved it in such a manner that from his proof the extension to the solution of all triangles could be deducted. Clavius generalized the method in his treatise *De astrado* (1593), lib. i. lemma liii. The lemma is enunciated as follows:

"Quaestiones omnes, quae per sinus, tangentes, etque secantes absolvit, per solam prosthaphaeresim, id est, per solam additionem, subtractionem, sine laboriosa numerorum multiplicatione divisioneque expedit." 3

Clavius then refers to a work of Raymurus Ursus Dithmarus as containing an account of a particular case. The work is probably the *Fundamentum astronomici* (1588). Longomontanus, in his *Astronomia Daconia* (1622), gives an account of the method, stating that it is not to be found in the writings of the Arabs or Regiomontanus. As Longomontanus is mention in Anthony Wood's anecdote, and as Wittich as well as Longomontanus were assistants of Tycho, we may infer that Wittich's prosthaphaeresis is the method referred to by Wood. It is evident that Wittich's prosthaphaeresis could not be a good method of practically effecting multiplications unless the quantities to be multiplied were sines, on account of the labour of the interpolations. It satisfies the condition, however, equally with logarithms, of enabling multiplication to be performed by the aid of a table of single entry; and, analytically considered, it is not so different in principle from the logarithmic method. In a careful examination of the history of the method is given by Scheibl in his *Einsleistung zur mathematischen Buchenknirps* (Stück vii. (Breslau, 1775), pp. 13-20; and there is also an account in Kästner's *Geschichte der Mathematik*, 1796; in Montucla's *Histoire des mathématiciens*, i. 505-585; and in Kgliger's *Worterbuch* (1808), article "Prosthaphaeresis.") 4

Besides its connexion with logarithms and improvements in the method of prosthaphaeresis, Byrgius has a share in the invention of the sine. In fact, if we put \(x = \sin y\), \(y = \sin \theta\) and \(x = \cos y\), \(y = \cos \theta\), Byrgius attributes to him (in the use of his prosthaphaeresis) the first introduction of a subsidiary angle into trigonometry (vol. ii. 590). To Napier's *Descriptio* in order to describe its reception on the continent, and to mention the other logarithmic tables which were published while Briggs was occupied with his calculations.

John Kepler, who has been already quoted in connexion with Craig's visit to Tycho Brahe, received the invention of logarithms almost as enthusiastically as Briggs. His first mention of the subject occurs in a letter to Scheubel dated the 11th of March 1618, in which he writes—*Exitit Scotus Baro, curio nomen mihi exsudit, qui praecclari quid praestitit, necessitate omni multiplicationum et divisionem in meris additiones et subtractiones commutata, nec sinus utitur; a tamen opus est ipsi tangentium canone: et variatas, crebris, difficilissime additionum et subtractionumque alculi laborem multiplicandi et dividendi superat.* This erroneous estimate was formed when he had seen the *Descriptio* but had not read it; and his opinion was very different when he became acquainted with the nature of logarithms. The dedication of his *Epheemeris* for 1625 consists of a letter to Napier dated the 28th of July 1619, and he there congratulates him warmly on his invention and on the benefit he has conferred upon astronomy generally and upon Kepler's own Rudolphine tables. He says that, although Napier's book had been published five years, he first saw it at Prague two years before; he was then unable to read it, but last year he had met with a little work by Benjamin Ursinus 4 containing the substance of the method, and he at once recognized the importance of what had been effected. He then explains how he verified the canon, and so found that there were no essential errors in it, although there were a few inaccuracies near the beginning of the quadrant, and he proceeds, "Haece te obliter scire volui, ut quibus te methodos inuesseris, quas non dubito et plurimas et ingeniosissimas tibi in promptu esse..." 

1 The title of this work is—*Benjaminis Ursini... cursus mathematici practici volumen primum continetur illustr. & generosi D. Dn. Johannis Neperti Baronis Merchiston... Sciti trigonometriae... ex antiquis... usum... ex amplissima et commodat... Coloniis... 1624*.

2 The title of this work is—*Neperti Baronis Merchiston... Sciti trigonometriae... ex antiquis... usum... ex amplissima et commodat... Coloniis... 1624*.

3 The title of this work is—*Logarithmorum canonis descriptio, seu arithmetica prosthaphaeretica... expositione mirabilis...*—Paris, 1614; 1624: it is the earliest of all Napier's works that have come to the light; many writers have, however, erroneously given its title as the latter.
LOGARITHM

numbers up to 1,000, and log sines and tangents from Gunter's Canon (1620). In the following year, 1626, Denis Henrion published at Paris a Tractatus de Logarithmis, containing Briggs' logarithms of numbers up to 20,001 to 10, places, and Gunter's log sines and tangents to 7 places for every minute. In the same year de Decker also published at Gouda a work entitled Nieuwe Tekelson, inhoudende de Logarithmi voor de Ghelatten beginnende van 1 tot 10,000, which contained logarithms of numbers up to 10,000 to 10 places, taken from Briggs' Arithmetica of 1624, and Gunter's log sines and tangents to 7 places for every minute.1 Vlacq rendered assistance in the publication of this work, and the privilege is made out to him. The invention of logarithms and the calculation of the earlier tables forms a very striking episode in the history of exact science, and, with the exception of the Principia of Newton, there is no mathematical work published in the country which has produced such important consequences, or to which so much interest attaches as to Napier's Descriptio. The calculation of tables of the natural trigonometrical functions may be said to have formed the work of the last half of the 16th century, and the great canon of natural sines for every 10 seconds to 15 places which had been calculated by Riccioli was published by Pitiscus only in 1613, the year before that in which the Descriptio appeared. In the construction of the natural trigonometrical tables Great Britain had taken no part, and it is remarkable that the discovery of the principles and the formation of the tables that were to revolutionize or supersede all the methods of calculation then in use should have been so rapidly effected and developed in a country in which so little attention had been previously devoted to such questions.

For more detailed information relating to Napier, Briggs and Vlacq, and the invention of logarithms, the reader is referred to the life of Briggs in Ward's Lives of the Professors of Gresham College (London, 1779); and Smith's explanation and illustration of Napier's Descriptio et illustrium virorum (Vita Henrici Briggsi) (London, 1707); Mark Napier's Memoirs of John Napier already referred to, and the same author's Naperi libri qui supersunt (1836); Hutton's History; de Molk's letters already referred to; Delambre's Histoire de l'astronomie moderne; the report on mathematical tables in the Report of the British Association for 1873; and the Philosophical Magazine for October and December 1872 and May 1873. It may be remarked that the date usually assigned to Briggs' first visit to Napier is 1616 and not 1615 as stated above, the reason being that Napier was generally supposed to have died in 1618; but it was shown by Mark Napier that the true date is 1617.

In the years 1791-1807 Francis Meresers published at London, in six volumes quarto "Scriptores Logarithmici, or a collection of several curious tracts on the nature and construction of logarithms, mentioned in Dr Hutton's historical introduction to his new edition of Sherwin's mathematical tables . . . , which contains reprints of Napier's Descriptio of 1614, Kepler's writings on logarithms (1624-1625), &c." In 1886 a translation of Napier's Constructio of 1619 was published by Walter Rae Macdonald. Some valuable notes are added by the translator, in one of which he shows the accuracy of the method employed by Napier in his calculations, and explains the origin of a small error which occurs in Napier's table. Appended to the Catalogue is a full and careful bibliography of all Napier's writings, with mention of the public libraries, British and foreign, which possess copies of each. A facsimile reproduction of Bartholomew Vincent's Lyons edition (1620) of the Constructio was issued in 1805 by A. Hermann at Paris (this imprint occurs on page 62 after the word "Finis"). It now remains to notice briefly a few of the more important events in the history of logarithmic tables subsequent to the original calculations.

Common or Briggian Logarithms of Numbers. —Nathaniel Roe's Tabulae logarithmicae (1633) was the first complete seven-figure table that was published. It contains seven-figure logarithms of numbers from 1 to 100,000, with characteristics unseparated from the mantissa, and was formed from Vlacq's table (1628) by leaving out the last three figures. All the figures of the number are given at the 16th place, 1.000 being thus given in two decimal places in the extreme columns—1 to 50 on the left-hand side, and 50 to 100 on the right-hand side. The first four figures of the logarithms are printed at the top of the columns. There is thus an advance half way towards the arrangement now universal in seven-figure tables. The final step was taken in 1674, by John Newton, in his Tables of Logarithms, a work which is also noticeable as being the only extensive eight-figure table that until recently had been published; it contains logarithms of sines, &c., as well as logarithms of numbers.

In 1805 appeared the original edition of Sherwin's tables, the first of the series of ordinary seven-figure tables of logarithms of numbers and trigonometrical functions such as are in general use now. The work went through several editions during the 18th century, but was at length superseded in 1785 by Hutton's tables, which continued in successive editions to maintain their position for a century. In 1717 Abraham Sharp published in his Geometry Improved the Briggian Tables, which correspond to those of Hutton in England. These tables, which form the basis of the Briggian or seven-figure logarithms so generally used collection of logarithms for the general computer that has been published, passed through many editions. In 1794 Vega published his Thesaurus logarithmorum completus, a work containing a number of the logarithms of numbers from Vlacq's Arithmetica logarithmica of 1628, and Trigonometria artificialis of 1633. The logarithms of numbers are arranged in an ordinary seven-figure table. In addition to the logarithms for the trigonometrical functions, Vega also published in 1797, in 2 vols. 8vo, a collection of logarithmic and trigonometrical tables which has passed through many editions, a very useful one volume stereotype edition having been published in 1831. The Briggian Tables from this may be regarded as to some extent supplementary to those in Callet.

If we consider only the logarithms of numbers, the main line of descent from the original calculation of Briggs and Vlacq is Roe's Logarithmorum Galericum, Gardiner; there are then two branches, viz. Hutton founded on Gardiner's work, and the various editions of Vega form a separate offshoot of the original tables. Among the most useful and accessible of modern ordinary seven-figure tables of logarithms of numbers and trigonometrical functions are Napier's Logarithms (1805-1806) by W. D. and J. B. Roberts. For logarithms of numbers only perhaps Babbage's table is the most convenient.2

In 1871 Edward Sang published a seven-figure table of logarithms of numbers from 20,000 to 200,000, the logarithms between 100,000 and 200,000 being the result of a new calculation. By beginning the table at 20,000 instead of at 10,000 the differences are halved in magnitude, while the number of them in a page is quartered. In this table multiples of the differences, instead of proportional parts, are given.3 John Thomson of Greenock (1782-1855) made an independent calculation of logarithms of numbers up to 120,000 to 12 places of decimals, and his table has been used to verify the errata of Sang's table (Proc. Roy. Soc. R. Edin. vol. 34, p. 447). A table of ten-figure logarithms of numbers up to 100,000 was calculated by W. W. Duffield and published in the Report of the U.S. Coast and Geodetic Survey for 1895-1896 as Appendix 12, pp. 395-521. These results were compared with Vega's Thesaurus (1794) before publication.

Common or Briggian Logarithms of Trigonometrical Functions. —The next great advance on the Trigonometria artificialis took place more than a century and a half afterwards, when Michael Taylor published his Trigonometria artificialis, giving logarithms to every second of the quadrant; it was calculated by interpolation from the Trigonometria to 10 places and then contracted to 7. On account of the great size of this table, and for other reasons, it never

1 The smallest number of entries which are necessary in a table of logarithms in order that the intermediate logarithms may be calculable by proportional parts has been investigated by J. E. A. Steggall in the Proc. Edin. Math. Soc. 1892, 10, p. 35. This number is 1700 in the case of a seven-figure table extending to 100,000.
came into very general use, Bagay's *Newelles tables astronomiques* (1825), which also contains log sines and tangents to every second, being preferred; this latter work, which for many years was difficult to procure, has been reprinted with the original title-page and date under the title of *Logarithms*. The logarithmic tablets included in the *Logarithmic Tables* (1849). In 1784 the French government decided that new tables of sines, tangents, &c., and their logarithms, should be calculated independently to the results of the work of Prüy, which was charged with the direction of the work, and was expressly required "non seulement à composer des tables qui ne laissent rien à désirer quant à l'exactitude, mais à en faire le monument de calcul le plus vaste que l'on ait jamais essayé d'entreprendre." Those engaged upon the work were divided into three sections: the first consisted of five or six mathematicians, including Legendre, who were engaged in the purely analytical work, or the calculation of the logarithmic integrals; the second section consisted of seven or eight calculators possessing some mathematical knowledge; and the third comprised seventy or eighty ordinary computers. The work, which was performed wholly in duplicate, and independently of each other, was not commenced until 1840, and the numbers are not commensurable, one deposited at the Observatory, and the other in the library of the Institute, at Paris. Each of the two manuscripts consists essentially of seventeen large folio volumes, the contents being as follows:

- Logarithms of numbers up to 200,000
- Logarithms of the ratios of arcs to sines from $\pi/2$ to $\pi$, and log sines through $\pi/2$ to $\pi$.
- Logarithms of the ratios of arcs to tangents from $\pi/2$ to $\pi/4$, and log tangents throughout the quadrant.

The trigonometrical results are given for every hundred-thousandth of the quadrant, and the logarithms were calculated to 14 places, with the intention that only 12 should be published, but the twelfth figure is not to be relied upon. The tables have never been published, and are generally known as the *Tables du Cadastre*, or, in England, as the great French manuscript tables.

A very full account of these tables, with an explanation of the methods of calculation, formulae employed, &c., was published by Lefort in *Memoires de l'Académie des Sciences de Paris* (1847). A table of natural sines was once begun, and Lefort states that he has seen six copies, all incomplete, although including the last page. Babble compared his table with the *Tables du Cadastre*, and Lefort has given them as the most complete of all the tables of natural logarithms published in the world. The *Tables du Cadastre* and *Brigge's* logarithms of numbers which were obtained by comparing the manuscript tables with those contained in the *Arithmetica Logarithmica of 1624* and of 1628.

As the *Tables du Cadastre* remained unpublished, other tables appeared, in which the quadrant was divided centesimal, the most important of these being Hubert and Iderle's *Newelles tables trigonométriques* (1799), and Borda and Delambre's *Tables trigonométriques de l'Equateur* (1800-1801), both of which, however, were difficult to procure, and greater accuracy being required, the French government in 1811 published an eight-figure centesimal table, for every ten seconds, derived from the *Tables du Cadastre*.

**Doddson's British Antilogarithms.**—In the ordinary tables of logarithms the natural numbers are all integers, while the logarithms calculated are incommensurable. In an antilogarithmic table, the logarithms are exact quantities such as $\log a = 0.3010$, $\log b = 0.4771$, &c., from which the numbers are obtained by inverting the logarithmic tables. The earliest and largest table of this kind that has been constructed is Dodson's *Antilogarithmic canon* (1742), which gives the numbers 11 places, corresponding to the logarithms from $-99999$ to $99999$. The *Logarithmic canon* is, therefore, the only other extensive table of the same kind that has been published occurring in Shortrede's *Logarithmic Tables* already referred to, and in Filipowski's *Table of antilogarithms* (1849). Both are similar to Dodson's, but they give numbers only to 7 places.

**Hyperbolic or Napierian logarithms (i.e. to base e).**—The most elaborate table of hyperbolic logarithms that exists is due to Wolfram, a Dutch lieutenant of artillery. His table gives the logarithms of all numbers between the values of 1 and 10,000, and also of a great many more, from 2200 to 10,009, to 48 decimal places. The table appeared in Schütze's *Neue und erweiterte Sammlung logarithmischer Tafeln* (1778), and was reprinted in Vega's *Theaurum* (1794), already referred to. This omission omitted only the numbers below 10,001, which were afterwards published by the same author. Wolfram had been prevented from computing by a serious illness, but the work was continued, and the table, as given by Vega, is complete. The largest hyperbolic table as regards range was published by A. H. D. Brahe and E. G. E. medelingen van de natuurkunde. Deel iv (1862), p. 15.

1. In vol. xv. (1875) of the *Verhandelingen* of the Amsterdam Academy of Sciences, Bierens de Haan has given a list of 553 tables of logarithms. A previous paper of the same kind, containing notices of some of the tables, was published by him in the *Verhandelingen* van Mededelingen van de natuurkunde. Deel iv (1862), p. 15.

Logarithms are now called ratios or fractions are *logistic numbers*, so that a table of $\log(a/x)$ where $a$ is the argument and $a$ a constant is called a table of logistic or proportional logarithms; and since $\log(a/x) = \log a - \log x$ if it is clear that the tabular results differ from those given in an ordinary table of logarithms by the subtraction of a constant and a sign. The first table of this kind appeared in Kepler's work of 1624 which has been already referred to.

The object of a table of $\log(a/x)$ is to facilitate the working out of proportions in which the logarithms are to be compared, and the number of numbers themselves being unknown; and on this account they are frequently called addition and subtraction logarithms. The object of the table is in fact to give $\log(a/b)$ by only one entry when $\log a$, or $\log b$, are given. The utility of this point is pointed out by Leonelli in a book entitled *Supplement logarithmique*, printed at Bordeaux in the year XI. (1802/3); he calculated a table to 14 places, but only a specimen of it which appeared in the *Societé de Mathématiques* was printed. The development of this kind of table is due to Gauss, and was printed in *Zachs's Monatliche Correspondenz*, xxvi. 498 (1812). Corresponding to the argument $\log a$ it gives the values of $(1 + 2a)$ and $(1 + a)$.

**Dual Logarithms.**—The term was first used by I. E. Byrne in a series of works published between 1865 and 1870. Dual numbers and logarithms depend upon the expression of a number as a product of $1 + i, 1 + i$, or $1 + i$. The utility of this point is pointed out by Leonelli in a book entitled *Supplement logarithmique*, printed at Bordeaux in the year XI. (1802/3); he calculated a table to 14 places, but only a specimen of it which appeared in the *Societé de Mathématiques* was printed. The development of this kind of table is due to Gauss, and was printed in *Zachs's Monatliche Correspondenz*, xxvi. 498 (1812). Corresponding to the argument $\log a$ it gives the values of $(1 + 2a)$ and $(1 + a)$.

**Calculation of Logarithms.**—The same name is derived from the words *Logarithm*, the number of the ratios, and the way in which logarithms are used in the calculation, reference should be made to the article *TABLES, MATHEMATICAL*.
of the one above it. To construct this table Briggs, using about thirty places of decimals, extracted the square root of 10 at forty-five figures, and thus found that the logarithm of 1-000000 000000 000000 000000 12781 91393 20032 35 was 0-000000 000000 00005511 1512 31257 87202, and that for numbers of this form (i.e. for numbers beginning with 1 followed by fifteen ciphers, and then by seventeen or a less number of significant figures) the logarithms were proportional to these significant figures. He then means by a simple proportion deduced the log (1-000000 000000 000000 000000 03432 94481 93235 1804), so that, a quantity 1-000000 000000 0000 (where x consists of not more than seventeen figures) having been obtained by repeated extraction of the square root of a given number, the logarithm of 1-000000 000000 0000 could then be found by multiplying x by -000000 000000 03432...

To find the logarithm of 2, Briggs raised it to the tenth power, viz. 1024, and extracted the square root of 1024 forty-seven times, the result being 1-000000 000000 16851 60870 55949 77. Multiplying the significant figures by 2^42, he obtained the log of the quantity, viz. 0-477121254719 29915 60862 07235 28834 7... The log belongs to 2, and was, according to modern notation, 0-30102 99956 63981 195. Briggs calculated in a similar manner log 6, and thence deduced log 3.

It will be observed in the first place that the value of the modulus is in fact calculated from the formula

$$\frac{1}{10^{10}} = \log_{10} 1$$

The value of x being \(10^{2/10}\), and in the second process the modulus is \(2/10\) calculated from the formula.

$$\log_{10} 2 = \left(10^{2/10}-1\right) \times \frac{10}{10^{10}}$$

Briggs also gave methods of forming the mean proportions or square roots by differences; and the general method of constructing logarithmic tables by means of differences is due to him.

The following calculation of log 5 is given as an example of the application of a method of mean proportions. The process consists in taking the geometric mean of numbers above and below 5; the object being to at length arrive at 5-00000. To every geometric mean in the column of numbers there corresponds the arithmetical mean in the column of logarithms. The numbers are denoted by A, B, C, &c., in order to indicate their mode of formation.

Numbers. Logarithms.

Great attention was devoted to the methods of calculating logarithms during the 17th and 18th centuries. The earlier methods proposed were, like those of Briggs, purely arithmetical, and for a long time logarithms were regarded from the point of view indicated by their means, that is to say, as depending on the theory of compounded ratios. The introduction of infinite series into mathematics effected a great change in the modes of calculation and the treatment of the subject. Besides Napier and Briggs, special reference should be made to Kepler (Chilias, 1624) and Mercator (Logarithmotechnia, 1668), whose methods were arithmetical, and to Newton, Gregory, Halley and Cotes, who employed series. A full and valuable account of these methods is given in Hutton's 'Construction of Logarithms,' which occurs in the introduction to the earlier parts of his Mathematical Tables, and also forms tract 21 of his Mathematical Tracts (vol. i, 1812). Many of the early works on logarithms were reprinted in the Scriptoris logarithmicorum of Baron Maseres already referred to.

In the following account only those formulae and methods will be referred to which would now be used in the calculation of logarithms.

Since

$$\log_{10}(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots$$

we have, by changing the sign of x,

$$\log_{10}(1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \frac{x^4}{4} + \ldots$$

whence

$$\frac{1}{1-x} = 2(1 + \frac{x^2}{2} + \frac{x^4}{3} + \ldots$$

and, therefore, replacing x by \(\frac{p}{1+p}\),

$$\log_{10}\left(\frac{1+p}{1-p}\right) = 2\left(\frac{p}{2p+1}\right) + \frac{p}{1+p} + \frac{p}{1+p} \ldots$$

in which the series is always convergent, so that the formula affords a method of deducing the logarithm of one number from that of another.

As particular cases we have, by putting \(p = 1\),

$$\log_{10}p = 2\left(\frac{1}{2p+1}\right) + \frac{1}{1+p}$$

and by putting \(p = p+1\),

$$\log_{10}(p+1) = 2\left(\frac{1}{2p+1}\right) + \frac{1}{1+p}$$

The following still more convenient formulae for the calculation of \(\log_{10}p\) were given by J. Couch Adams in the Proc. Roy. Soc., 1875, p. 27.

If

$$a = \log_{10}4 = -\log\left(1 - \frac{1}{10}\right)$$

then

$$\log_{10}3 = \frac{a}{10}$$

By means of these formulae Adams calculated the values of \(\log_{10}, \log_{10}5, \log_{10}6, \log_{10}7\) to 276 places of decimals, and deduced the value of \(\log_{10}10\) and its reciprocal M, the modulus of the Briggian system of logarithms. The value of the modulus found by Adams is

$$M = 0-43429 44819 03251 82765 11296$$

$$X = V/X = 18916 60508 29243 67005 80365$$

$$65661 14453 78316 3469 40280$$

$$78077 47929 24949 33843 17483$$

$$18706 10674 47663 03733 64167$$

$$92911 58963 90656 92210 64662$$

$$81226 58521 27086 56867 03295$$

$$93370 89665 88266 8531 16360$$

$$77354 95914 28413 4866 7684$$

$$63060 85135 01488 2124 8765$$

$$43543 43573 71253 85622 21868$$

which is true certainly to 272, and probably to 273, places (Proc. Roy. Soc., 1884, 42, p. 22, where also the values of the other logarithms are given).

The logarithms are to be Briggsian all the series in the preceding formulae must be multiplied by M, the modulus; thus,

$$\log_{10}(1+x) = M(x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots$$

and so on.

As has been stated, Abraham Sharp's table contains 61-decimal
Briggian logarithms of primes up to 1100, so that the logarithms of all composite numbers whose greatest prime factor does not exceed this number may be found by simple addition; and Wolfram's table gives 45-decimal hyperbolic logarithms of primes up to 10,009. By means of these tables the number of factors of the number 61 or a less number of places or of its hyperbolic logarithm to 48 or a less number of places in the following manner. Suppose the hyperbolic logarithm of the prime number 43,867 required. Multiplying by 50, we have 50 x 43,867 = 2,193,349; and on looking up Burckhardt's Table de dividere for a number near to this which shall have no prime factor greater than 10,009, it appears that

\[ 2,193,349 \times 47 = 102,9209 \]

thus

\[ \log_{10} 43,867 = \log_{10} 2,193,349 + \log_{10} 47 - \log_{10} 2,193,349 = 1 + 7 \cdot 5 + 2 - 1 = 13 \cdot 5 \]

and therefore

\[ \log_{10} 43,867 = 13 \cdot 5 - 2 \cdot 13 \cdot 5^2 + 2 \cdot 13 \cdot 5^3 + \cdots \]

The first term of the series in the second line is

\[ 1 \cdot 000000 04559 23975 07319 6286 \]

dividing by 2 x 2 x 193,349 we obtain

\[ 0 \cdot 000000 000000 000000 000 \]

and the third term is

\[ 0 \cdot 000000 000000 000000 3599 \]

so that the series is

\[ 0 \cdot 000000 04559 23961 13997 4419 \]

whence, taking out the logarithms from Wolfram's table,

\[ \log_{10} 43,867 = 10 \log_{10} 68981 76079 10191 3661 \]

The principle of the method is to multiply the given prime (supposed to consist of 4, 5 or 6 figures) by such a factor that the product may be a multiple of the range of the factor tables, and such that, when increased by 1 or 2, the prime factors may all be within the range of the logarithmic tables. The logarithm is then obtained by use of the formula

\[ \log (x + d) = \log x + \frac{d}{x} \log_2 \left( 1 + \frac{d}{x} \right) + \cdots \]

in which of course the object is to render \( d / x \) as small as possible. If the logarithm required is Briggian, the value of the series is to be multiplied by \( M \), where \( M \) is the number of the nine digits, and making use of subsidiary tables of logarithms of factors of this form. For example, suppose the logarithm of 54389 required to twelve places. Dividing by 10 and by 5 the number becomes 10478 and resolving this number into factors of the form \( 1+10^n \) we find

\[ 54389 = 10 \times 5 \times (1-10^8) \times (1-10^3) \times (1-10^6) \times (1-10^5) \times (1-10^7) \times (1-10^2) \times (1-10^3) \times (1-10^9) \]

where 1-10^8 denotes 10-8, 1-10^6 denotes 10-6, &c., and so on. All that is required is to find in the logarithm of any number a table of logarithms, to the required number of places, of \( 10^8, 10^3, 10^6, \&c., \).

The resolution of a number into factors of the above form is easily performed. Taking, for example, the number 1087678, the object is to destroy the significant figure 8 in the second place of decimals; this is effected by multiplying by 10-8, thereby taking the number 1087678 x 10-8, subtracting from the number eight times itself advanced two places, and we thus obtain 1000000376. To destroy the first 6 multiply by 10-6 giving 1000000376 x 10-6, and multiplying successively by 10-6 and 10-6, we obtain 1000000376 x 10-6, and so on. This is clear, and it is seen that the parts of the number corresponding to the factors of the form \( 1+10^n \) play the part of the potential index as a means of calculating logarithms, printed in the Proceedings of the Royal Society, vol. xxxi., 1881, pp. 401-407, and vol. xxxii., 1881, pp. 377-379. Reference should also be made to Hoppe's Tafeln zu dressierenden logarithmischen Rechnung (Leipzig, 1870), which give in a somewhat modified form a table of the hyperbolic logarithm of \( 1+10^n \).

The preceding methods are only appropriate for the calculation of isolated logarithms. If a complete table had to be reconstructed, or a table had to be produced in a manner suitable for the employment of differences. A full account of this method as applied to the calculation of the Tables du Cadastre is given by Letort in vol. iv. of the Annales de l'Observatoire de Paris (1867).

LOGAU, Friedrich, Freiherr von (1604—1655), German epigrammatist, was born at Brockut, near Nimpfch, in Silesia, in June 1604. He was educated at the gymnasium of Brieg and subsequently studied law. He then entered the service of the duke of Brieg. In 1644 he was made "ducal councillor." He died at Liegnitz on the 24th of July 1655. Logau's epigrams, which appeared in two collections under the pseudonym "Salomon von Golaw" (an anagram of his real name) in 1638 (Erstes Hundert Teutscher Reimenspriiche) and 1654 (Deutscher Sinngedichte drei Tausend), show a marvellous range and variety of expression. He had suffered bitterly under the adverse conditions of the time; but his satire is not merely the outcome of personal feeling. In the turbulent age of the Thirty Years' War he was one of the few men who preserved intact his intellectual integrity and judged his contemporaries fairly. He satirized with unsparing hand the court life, the useless bloodshed of the war, the lack of national pride in the German people, and their slavish imitation of the French in customs, dress and speech. He is regarded as the Fruchbringende Gesellschaft under the name Der Verkleinernde, and regarded himself as a follower of Martin Opitz; but he did not allow such ties to influence his independence or originality.

Logau's Sinngedichte were edited in 1759 by G. E. Lessing and K. W. Ramler, who first drew attention to their merits; a second
The "sayings" of 1903 were prefaced by the following introductory statement:—

"... the words which Jesus the living (Lord) spake to ... and Thomas and he said unto (them) every one that hearkens to these words shall never taste of death."

The "sayings" themselves are as follows:—

1. "Je'vej wvcicwv, mp ay (a) ouc, ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

2. "Je'vej wvcicwv, tois ποδισκουσανες και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

3. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

4. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

5. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

6. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

7. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."

8. "... ετωματισθησθηται, οδοθησθαι ... και ες αναγκασθηται αυτοι τοις ξυναγωνικοις, επισκεψαι την αυτην αιτιαν ..."
 said, The key of knowledge ye hid: ye entered not in yourselves, and to them that were entering in, ye opened not."

The second Gospel fragment discovered in 1907 "consists of a single vellum leaf, practically complete except at one of the lower corners and here most of the lacunae admit of a satisfactory solution." The translation is as follows:

... before he does wrong makes all manner of subtle excuse. But give heed lest ye also suffer the same things as they: for the evildoers are avenged, and are laid to rest, but not before, but also await punishment and much torment. And they took and brought them into the very place of purification and was walking in the temple. And a certain Pharisee, a chief priest, whose name was Levi, met them and said to the Saviour. Who gave thee leave to walk in the place of purification, and to see these holy vessels when thou hast not washed nor yet have thy disciples bathed their feet? But defiled thou hast walked in this temple, which is a pure place, wherein no other man walks except he has washed himself and changed his garments neither doth he venture to see these holy vessels. And the Saviour straightway stood still with his disciples and answered him. Art thou then, being here in the temple, clean? He saith unto him, I am clean; for I am in the pool of David and having descended by one staircase, I ascended by another and I put on white and clean garments, and then I came and looked upon these holy vessels. The Saviour answered and said unto him, Woe ye blind, who see not. Thou hast washed in these running waters wherein doth the Jew thy servant; and hast cleansed and wiped the outside skin which also the harlots and flute-girls anoint and wash and wipe and beautify for the lust of men; but within they are full of serpents and all wickedness. But I am thy disciples who thou hast not bathed have not bathed in the waters of eternal life which come from... but woe unto thee... These documents have naturally excited considerable interest and raised many questions. The papyri of the "sayings" date from the 3rd century and most scholars agree that the "sayings" themselves go back to the 2nd. The year A.D.140 is generally assigned as the terminus ad quem. The problem as to their origin has been keenly discussed. There are two main types of theory. (1) Some suppose that they are excerpts from an uncannonic Gospel. (2) Others think that they represent an independent and original collection of sayings. The first theory has assumed three main forms. (a) Harnack maintains that they were taken from the Gospel according to the Egyptians. This theory, however, is based upon a hypothetical reconstruction of the Gospel in question which has found very few supporters. (b) Others have advocated the Gospel of the Hebrews as the source of the "sayings," on the ground of the resemblance between the first "saying" of the 903 series and a well-authenticated fragment of that Gospel. The resemblance, however, is not sufficiently clear to support the conclusion. (c) A third view supposes that they are extracts from the Gospel of Thomas—an apocryphal Gospel dealing with the boyhood of Jesus. Beyond the allusion to Thomas in the introductory paragraph to the 903 series, there seems to be no tangible evidence in support of this view. The second theory, which maintains that the papyri represent an independent collection of "sayings," seems to be the opinion which has found greatest favour. It has won the support of W. Sanday, H. B. Swete, Reniel Harris, W. Lock, Heirijic, &c. There is a considerable diversity of judgment, however, with regard to the value of the collection. (a) Some scholars maintain that the collection goes back to the 1st century and was the source from which the Gospels derived. (b) Others maintain that it is a later composition, and give account of the teaching of Jesus. They are therefore disposed to admit to a greater or less extent and with widely varying degrees of confidence the presence of genuine elements in the new matter. (b) Sanday and many others regard the sayings as originating in the 2nd century and think that, though not "directly dependent on the Canonical Gospels," they have "their origin under conditions of thought which these Gospels had created." The "sayings" must be regarded as expansions of the true tradition, and little value is therefore to be attached to the new material.

With the knowledge at our disposal, it is impossible to reach an assured conclusion between these two views. The real problem, to which at present no solution has been found, is to account for the new material in the "sayings." There seems to be no motive sufficient to explain the additions that have been made to the text of the Gospels. It cannot be proved that the expansions have been made in the interests of any sect or heresy. Unless new discoveries provide the clue, or some reasonable explanation can otherwise be found, there seems to be no reason why we should not regard the "sayings" as containing material which ought to be taken into account in the critical study of the teaching of Jesus.

The 1903 Gospel fragment is so mutilated in many of its parts that it is difficult to decide upon its character and value. It appears to be earlier than 150, and to be taken from a Gospel which followed more or less closely the version of the teaching of Jesus given by Matthew and Luke. The phrase "when ye shall be stripped and not be ashamed" contains an idea which has some affinity with two passages found respectively in the Gospel according to the Egyptians and the so-called Second Epistle of Clement. The resemblance, however, is not sufficiently close to warrant the deduction that either the Gospel of the Egyptians or the Gospel from which the citation in 2 Clement is taken (if these two are distinct) is the source from which our fragment is derived.

The second Gospel fragment (1907) seems to be of later origin than the documents already mentioned. Grenfell and Hunt conclude that it is an excerpt, about 200. There is considerable difficulty with regard to some of the details. The statement that an ordinary Jew was required to wash and change his clothes before visiting the inner court of the temple is quite unsupported by any other evidence. Nothing is known about "the place of purification" (άγριωτηταί) nor "the pool of David" (νημίω τοῦ Δαυίδ). Nor does the statement that "the sacred vessels" were visible from the place where Jesus was standing seem at all probable. Grenfell and Hunt conclude therefore—"So great indeed are the divergences between this account and the extant and no doubt well-informed authorities with regard to the topography and ritual of the Temple that it is hardly possible to avoid the conclusion that much of the local colour is due to the imagination of the author who was aiming chiefly at dramatic effect and was not really well acquainted with the Temple. But if the inaccuracy of the fragment in this important respect is admitted the historical character of the whole episode breaks down and it is probably to be regarded as an apocryphal elaboration of Matt. xv. 1-20 and Mark vii. 1-23."

LOGIC (λόγικη, sc. τίτηρ, the art of reasoning), the name given to one of the four main departments of philosophy, though its sphere is very variously delimited. The present article is divided into I. The Problems of Logic, II. History.

I. The Problems of Logic.

Introduction.—Logic is the science of the processes of inference. What, then, is inference? It is that mental operation which proceeds by combining two premises so as to cause a consequent conclusion. Some suppose that we may infer from one premise by a so-called "immediate inference." But one premise can only reproduce itself in another form, e.g. all men are animals; therefore some animals are men. It requires the combination of at least two premises to infer a conclusion different from both. There are as many kinds of inference as there are different ways of combining premises, and in the main three types:

1. Analogical Inference, from particular to particular: e.g. border-war between Thbes and Phocis is evil; border-war between Thbes and Athens is similar to that between Thbes and Phocis; therefore, border-war between Thbes and Athens is evil.

2. Inductive Inference, from particular to universal: e.g. border-war between Thbes and Phocis is evil; all border-war is like that between Thbes and Phocis; therefore, all border-war is evil.

3. Deductive or Syllogistic Inference, from universal to particular, e.g. all border-war is evil; border-war between Thbes and Athens is border-war; therefore border-war between Thbes and Athens is evil.
In each of these kinds of inference there are three mental judgments capable of being expressed as above in three linguistic propositions; and the two first are the premises which are combined, while the third is the conclusion which is consequent on their combination. Each proposition consists of two terms, the subject and its predicate, united by the copula. Each inference contains three terms. In syllogistic inference the subject of the conclusion is the minor term, and its predicate the major term, while between these two extremes the term common to the two premises is the middle term, and the premise containing the middle and major terms is the major premise, the premise containing the middle and minor terms the minor premise. Thus in the example of syllogism given above, “border-war between Thbes and Athens” is the minor term, “evil” the major term, and “border-war” the middle term. Using S for minor, P for major and M for middle, and preserving these signs for corresponding terms in analogical and inductive inferences, we obtain the following formula of the three inferences:—

<table>
<thead>
<tr>
<th>Analogical</th>
<th>Inductive</th>
<th>Deductive or Syllogistic</th>
</tr>
</thead>
<tbody>
<tr>
<td>S is P</td>
<td>S is P</td>
<td>Every M is similar to S</td>
</tr>
<tr>
<td>S’ is similar to S</td>
<td>Every M is similar to S</td>
<td>S is M</td>
</tr>
</tbody>
</table>

The love of unity has often made logicians attempt to resolve these three processes into one. But each process has a peculiarity of its own; they are similar, not the same. Analogical and inductive inference alike begin with a particular premise containing one or more instances; but the former adds a particular premise to draw a particular conclusion, the latter requires a universal premise to draw a universal conclusion. A citizen of Athens, who had known the evils of the border-war between Thbes and Phocis, would readily perceive the analogy of a similar war between Thbes and Athens, and conclude analogously that it would be evil; but he would have to generalize the similarity of all border-wars in order to draw the inductive conclusion that all alike are evil. Induction and deduction differ still more, and are in fact opposed, as one makes a particular premise the evidence of a universal conclusion, the other makes a universal premise evidence of a particular conclusion. Yet they are alike in requiring the generalization of the universal and the belief that there are classes which are whole numbers of similars. On this point both differ from inference by analogy, which proceeds entirely from particular premises to a particular conclusion. Hence we may redefine inference into particular inference by analogy and universal inference by induction and deduction. Universal inference is what we call reasoning; and its two species are very closely connected, because universal conclusions of induction become universal premises of deduction. Indeed, we often induce in order to deduce, ascending from particular to universal and descending from universal to particular in one act as it were; so that we may proceed either directly from particular to particular by analogical inference, or indirectly from particular through universal to particular by an inductive-deductive inference which might be called “perduction.” On the whole, then, analogical, inductive and deductive inferences are not the same but three similar and closely connected processes.

The three processes of inference, though different from one another, rest on a common principle of similarity of which each is a different application. Analogical inference requires that one particular is similar to another, induction that a whole number or class is similar to its particular instances, deduction that each particular is similar to the whole number or class. Not that these inferences require us to believe, or assume, or premise or formulate this principle either in general, or in its applied forms: the premises are all that any inference needs the mind to assume. The principle of similarity is used, not assumed by the inferring mind, which in accordance with the similarity of things and the parity of inference spontaneously concludes in the form that similars are similarly determined (“similia similibus convenire”). In applying this principle of similarity, each of the three processes in its own way has to premise both that something is somehow determined and that something is similar, and by combining these premises to conclude that this is similarly determined to that. Thus the very principle of inference by similarity requires it to be a combination of premises in order to draw a conclusion.

The three processes, as different applications of the principle of similarity, consisting of different combinations of premises, cause different degrees of cogency in their several conclusions. Analogy hardly requires as much evidence as induction. Men speculate about the analogy between Mars and the earth, and infer that it is inhabited, without troubling about all the planets. Induction has to consider more instances, and the similarity of a whole number or class. Even so, however, it starts from a particular premise which only contains many instances, and leaves room to doubt the universality of its conclusions. But deduction, starting from a premise about all the members of a class, compels a conclusion about every and each of necessity. One border-war may be similar to another, and the whole number may be similar, without being similarly evil; but if all alike are evil, each is evil of necessity. Deduction or syllogism is superior to analogy and induction in combining premises so as to involve or contain the conclusion. For this reason it has been elevated by some logicians above all other inferences, and for this very same reason attacked by others as no inference at all. The truth is that, though the premises contain the conclusion, neither premise alone contains it, and a man who knows both but does not combine them does not draw the conclusion; it is the synthesis of the two premises which at once contains the conclusion and advances our knowledge; and as syllogism consists, not indeed in the discovery, but essentially in the synthesis of two premises, it is an inference and an advance on each premise and on both taken separately. As again the synthesis contains or involves the conclusion, syllogism has the advantage of compelling assent to the consequences of the premises. Induction in general is a combination of premises to cause a conclusion; deduction is such a combination as to compel a conclusion involved in the combination, and following from the premises of necessity.

Nevertheless, deduction or syllogism is not independent of the other processes of inference. It is not the primary inference of its own premises, but constantly converts analogical and inductive conclusions into its particular and universal premises. Of itself it causes a necessity of consequence, but only a hypothetical necessity; if these premises are true, then this conclusion necessarily follows. To eliminate this “if” ultimately requires other inferences before deduction. Especially, induction to universals is the warrant and measure of deduction from universals. So far as it is inductively true that all border-war is evil, it is deductively true that a given border-war is therefore evil. Now, as an inductive combination of premises does not necessarily involve the inductive conclusion, induction normally leads, not to a necessary, but to a probable conclusion; and whenever its probable conclusions become deductive premises, the deduction only involves a probable conclusion. Can we then infer any certainty at all? In order to answer this question we must remember that there are many degrees of probability, and that induction, and therefore deduction, draw conclusions more or less probable, and rise to the point at which probability becomes moral certainty, or that high degree of probability which is sufficient to guide our lives, and even condemn murderers to death. But can we rise still higher and infer real necessity? This is a difficult question, which has received many answers. Some noliosists suppose a mental power of forming necessary principles of deduction a priori; but fail to show how we can apply principles of mind to things beyond mind. Some empiricists, on the other hand, suppose that induction only infers probable conclusions which are premises of probable premises; but they give up all exact science. Between these extremes there is room for a third theory, empirical yet providing a knowledge of the really necessary. In some cases of induction concerned with objects capable of abstraction and simplification, we have a power of identification, by which, not a priori but in the act of inducing a conclusion, we apprehend that the things signified
LOGIC 881

by its subject and predicate are one and the same thing which cannot exist apart from itself. Thus by combined induction and identification we apprehend that one and one are the same as two, that there is no difference between a triangle and a three-sided rectilineal figure, that a whole must be greater than its part by being the whole, that inter-resisting bodies necessarily force one another apart, otherwise they would not be inter-resisting but occupy the same place at the same moment. Necessary principles, discovered by this process of induction and identification, become premises of deductive demonstration to conclusions which are not only necessary consequents on the premises, but also equally necessary in reality. Induction thus is the source of deduction, of its truth, of its probability, of its moral certainty; and induction, combined with identification, is the origin of the necessary principles of demonstration or deduction to necessary conclusions.

Analogical inference in its turn is as closely allied with induction. Like induction, it starts from a particular premise, containing one or more examples or instances; but, as it is easier to infer a particular than a universal conclusion, it supplies particular conclusions which in their turn become further particular premises of induction. Its second premise is indeed merely a particular apprehension that one particular is similar to another, whereas the second premise of induction is a universal apprehension that a whole number of particulars is similar to those from which the inference starts; but at bottom these two apprehensions of similarity are so alike as to suggest that the universal premise of induction has arisen as a generalized analogy. It seems likely that man has arrived at the apprehension of a whole individual, e.g. a whole animal including all its parts, and thence has inferred by analogy a whole number, or class, e.g. of animals including all individual animals; and accordingly that the particular analogy of one individual to another has given rise to the general analogy of every to each individual in a class, or whole number of individuals, contained in the second premise of induction. In this case, analogical inference has led to induction, as induction to deduction. Further, analogical inference from particular to particular suggests inductive-deductive inference from particular through universal to particular.

Newton, according to Dr Pemberton, thought in 1666 that the moon moves so like a falling body that it has a similar centripetal force to the earth, 20 years before he demonstrated this conclusion from the laws of motion in the Principia. In fact, analogical, inductive and deductive inferences, though different processes of combining premises to cause different conclusions, are so similar and related, so united in principle and method, that they can be regarded as a system of inference, that they cannot be completely investigated apart, but together constitute a single subject of science. This science of inference in general is logic.

Logic, however, did not begin as a science of all inference. Rather it began as a science of reasoning (logos), of syllogism (συλλογισμός), of deductive inference. Aristotle was its founder. He was acquainted by course of many generations of spontaneous thinking (logica naturalis). Many of the higher animals infer by analogy: otherwise we cannot explain their thinking. Man so infers at first: otherwise we cannot explain the actions of young children, who before they begin to speak give no evidence of universal thinking. It is likely that man began with particular inference and with particular language; and that, gradually generalising thought and language, he learnt at last to think analogically, to induce and deduce, to reason, in short, and raise himself above other animals. In ancient times, and especially in Egypt, Babylon and Greece, he went on to develop reason into science or the systematic investigation of definite subjects, e.g. arithmetic of number, geometry of magnitude, astronomy of stars, politics of government, ethics of goods. In Greece he became more and more reflective and conscious of himself, of his body and soul, his manners and morals, his mental operations and especially his reason. One of the characteristics of Greek philosophers is their growing tendency, in investigating any subject, to turn round and ask themselves what should be the method of investigation. In this way the Presocratics and Sophists, and still more Socrates and Plato, threw out hints on sense and reason, on inferential processes and scientific methods which may be called anticipations of logic. But Aristotle was the first to conceive of reasoning itself as a definite subject of a special science, which he called analytics or analytic science, specially designed to analyse syllogism and especially demonstrative syllogism, or science, and to be in fact a science of sciences. He was therefore the founder of the science of logic.

Among the Aristotelian treatises we have the following, which together constitute this new science of reasoning:

1. The Categories, or names signifying things which can become predicates;
2. The De Interpretatione, or the enumeration of conceptions and their combinations by (1) nouns and verbs (names), (2) enunciation (propositions);
3. The Prior Analytics, on syllogism;
4. The Posterior Analytics, on demonstrative syllogism, or science;
5. The Topics, on dialectical syllogism; or argument;
6. The Sophistical Elenchi, on sophistical or contentious syllogism, or sophistical fallacies.

So far as we know, Aristotle had no one name for all these investigations. "Analytics" is only applied to the Prior and Posterior Analytics, and "logical," which he opposed to "analytical," only to the Prior Analytics. Secondly, while he analyzed syllogism into premises, major and minor, and premises into terms, subject and predicate, he attempted no division of the whole science; thirdly, he attempted no order and arrangement of the cases, but a system of logic, but only of the Analytic Topics and Sophistical Elenchi into a system of syllogisms. Nevertheless, when his followers had arranged the treatises into the Organon, as they called it to express that it is an instrument of science, then there gradually emerged a system of syllogistic logic, arranged in the triple division—terms, propositions and syllogisms—which has survived to this day as technical logic, and has been the foundation of all other logics, even of those which aim at its destruction.

The main problem which Aristotle set before him was the analysis of syllogism, which he defined as "reasoning in which certain things having been posited something different from them of necessity follows by their being those things" (Prior Analytics, i. 1). What then did he mean by reasoning, or rather by the Greek word λόγος of which "reasoning" is an approximate rendering? It was meant (cf. Post. An. i. 10) to be both internal, in the soul (δὲ τῶν λόγων, καὶ τῆς ψυχῆς), and external, in language (δὲ έξ ήλόγων): hence after Aristotle the Stoics distinguished λόγος καθῆκεν and πραφωμός. It meant, then, both reason and discourse of reason (cf. Shakespeare, Hamlet, i. 2). On its mental side, as reason it meant combination of thoughts. On its linguistic side, as discourse it was used for any combination of names to form a thesis, such as the definition. "rational animal," or a book, such as the Iliad. It had also the mathematical meaning of ratio; and in its use for definition it is sometimes transferred to essence as the object of definition, and has a mixed meaning, which may be expressed by "account." In all its uses, however, the common meaning is combination. When Aristotle called syllogism λόγος, he meant that it is a combination of premises involving a conclusion of necessity. Moreover, he tended to confine the term λόγος to syllogistic inference. Not that he omitted other inferences (πιστεύεις). On the contrary, to him (cf. Prior Analytics, ii. 24) we owe the triple distinction into inference from particular to particular (παράδειγμα, or example, or what we call "analogy"), inference from particular to universal (θεώρησις, induction), and inference from universal to particular (καταλόγος, syllogism, or deduction). What he called "inferences other than syllogism" are imperfect; that analogical inference is rhetorical induction; and that induction, through the necessary preliminary of syllogism and the sole process of ascent from sense, memory and experience to the principles of science, is itself neither reasoning nor science. To be perfect he thought that all inference must be reduced to syllogism of the first figure, which he regarded as the specially scientific inference. Accordingly, the syllogism appeared to him to be the rational process (μερά λόγοι), and the demonstrative syllogism from inductively discovered principles to be science.
LOGIC

(FΩΜΗΣ). Hence, without his saying it in so many words, Aristotle's logic perforce became a logic of deductive reasoning, or syllogism. As it happened this deductive tendency helped the development of logic. The obscure premise of analogy and induction, together with the paucity of experience and the backward state of physical science in Aristotle's time would have baffled even his analytical genius. On the other hand, the demonstrations of mathematical sciences of his time, and the logical forms of deduction evinced in Plato's dialogues, provided him with admirable examples of deduction, which is also the inference most capable of analysis. Aristotle's analysis of the syllogism showed man how to advance by combining his thoughts in trains of deductive reasoning. Nevertheless, the wider question remained for logic: what is the nature of all inference, and the special form of each of its three main processes?

As then the reasoning of the syllogism was the main problem of Aristotle's logic, what was his analysis of it? In distinguishing inner and outer reason, or reasoning and discourse, he added that it is not to outer reason but to inner reason in the soul that demonstration and syllogism are directed (Post. An. ii. 10). One would expect, then, an analysis of mental reasoning into mental judgments (συνήθεις) as premises and conclusion. In point of fact, he analysed it into premises, but then analysed a premise into terms, which he divided into subject and predicate, with the addition of the copula. This analysis of an inner mental demonstration as applied in the Analytics and in the other logical treatises, was evidently intended as a linguistic analysis. So in the Categories, he first divided things said (τὰ λέγοντα) into uncombined and combined (τὰ καταθετόντα) and then again divided the former into categories; and in the De interpretatione he expressly excluded mental conceptions and their combinations, and confined himself to nouns and verbs and enunciation, or, as we should say, to names and things. This form of inner mental reasoning, which has given logicians in general the impression, that he intended to analyse syllogism into propositions as premises, and premise into names as terms. His logic therefore exhibits the curious paradox of being both inner and outer.

The explanation is that outer speech is more obvious than inner thought, and that grammar and poetic criticism, rhetoric and dialectic proceed logic, and that out of those arts of language arose the more subtle logic of deduction, as opposed to the subtle logic of the proposition consisting of subject and predicate. At the same time, Aristotle was well aware that the science of reasoning is an art of language and must take up a different position towards speech as an expression of thought. In the Categories he classified names, not, however, as a grammarian by their structure, but as a logician by their signification. In the De interpretatione, having distinguished the enunciation, or proposition, from other sentences as that in which there is truth or falsity, he relegated the rest to rhetoric or poetry, and founded the logic of the proposition, in which, however, he retained the grammatical analysis into noun and verb. In the Analytics he took the final step of originating the syllogism, a formal demonstration of the proposition as predicate mediated by the copula, and analysed the syllogism into these elements. Thus did he become the founder of the logical but linguistic analysis of reasoning as discourse (ὅ λέγεται λόγος) by proper forms of propositions. His conclusion remained, what is the logical but mental analysis of reasoning itself (ὅ λέγεται λόγος) into its mental premises and conclusion?

Aristotle thus was the founder of logic as a science. But he laid too much stress on reasoning as syllogism or deduction, and on deductive science; and he laid too much stress on the linguistic analysis of rational discourse into proposition and terms. These two defects remain ingrained in technical logic to this day.

But in the course of the development of the science, logicians have endeavored to correct these defects, and have diverged into two schools. Some have devoted themselves to induction from sense and experience and widened logic till it has become a general science of inference and scientific method. Others have devoted themselves to the mental analysis of reasoning, and have narrowed logic into a science of conception, judgment and reasoning. The former belong to the school of empirical logic, the latter to the school of conceptual and formal logic. Both have started from points which Aristotle indicated without developing them. But we shall find that his true descendants are the empirical logicians.

Aristotle was the first of the empiricists. He consistently maintained that sense is knowledge of particulars and the origin of scientific knowledge of universals. In his view, sense is a congenital form of judgment (δόξας συμφορός κριτική, Post. An. ii. 19); a sensation of each of the five senses is always true of its proper object; without sense there is no science; sense is the origin of induction, which is the origin of deduction and science. The Analytics end (Post. An. ii. 19) with a detailed system of empiricism, according to which sense is the primary knowledge of particulars, memory is the retention of a sensation, experience is the sum of many memories, induction infers universals, and intelligence is the true apprehension of the universal principles of science, which is rational, deductive, demonstrative, from empirical principles.

This empirical groundwork of Aristotle's logic was accepted by the Epicureans, who endeavored most distinctly the fundamental character of sense knowledge. Their science of objects, processes and data, assembled and combined, forms the background of the inferences and conclusions. On this foundation the empire of mechanics begins with subsequent opinions, or what the moderns call "interpretation." Beneath deductive logic, in the logic of Aristotle and the canonic of the Epicureans, there already lay the logic of perception, or the sensory experience is the origin of all inference and science. It remained for Francis Bacon to develop these beginnings into a new logic of induction. He did not indeed accept the infallibility of sense or of any other operation unaided. He rather held that a method of the new kind was needed. Following Aristotle in this order—sense, memory, intellect—he resolved the whole process of induction into three ministrations:

1. The ministration to sense, aided by observation and experiment. The ministration to memory, aided by registering and arranging the data, and observation and experiment in tables of instances of agreement, difference and concomitant variations.
2. The ministration to intellect or reason, aided by the negative elimination of the obvious errors and of false conclusions. The ministration of deductive reasoning, aided by the analysis of the data of observation and experiment, and in tables of instances of agreement, difference and concomitant variations.
3. The ministration to universal or reason, aided by the negative elimination of the obvious errors and of false conclusions. The ministration of inductive reasoning, aided by the analysis of the data of observation and experiment, and in tables of instances of agreement, difference and concomitant variations.

In short, the comprehensive genius of Bacon widened logic into a general science of inference.

The other hand, the student of deductive deduction so over-emphasized induction by contending that it is the only process of discovering universals (εκ οὐκετοῦ), which deduction only applies to particulars. J. S. Mill in his Logic pointed out this deduct, and without departing from Baconian principles remained, what is the logical but mental analysis of reasoning itself (ὅ λέγεται λόγος) into its mental premises and conclusion?

Aristotle then was the founder of logic as a science. But he laid too much stress on reasoning as syllogism or deduction, and on deductive science; and he laid too much stress on the linguistic analysis of rational discourse into proposition and terms. These two defects remain ingrained in technical logic to this day. But in the course of the development of the science, logicians have endeavored to correct these defects, and have diverged into two schools. Some have devoted themselves to induction from sense and experience and widened logic till it has become a general science of inference and scientific method. Others have devoted themselves to the mental analysis of reasoning, and have narrowed logic into a science of conception, judgment, and reasoning. The former belong to the school of empirical logic, the latter to the school of conceptual and formal logic. Both have started from points which Aristotle indicated without developing them. But we shall find that his true descendants are the empirical logicians.

Aristotle was the first of the empiricists. He consistently maintained that sense is knowledge of particulars and the origin of scientific knowledge of universals. In his view, sense is a congenital form of judgment (δόξας συμφορός κριτική, Post. An. ii. 19); a sensation of each of the five senses is always true of its proper object; without sense there is no science; sense is the origin of induction, which is the origin of deduction and science. The Analytics end (Post. An. ii. 19) with a detailed system of empiricism, according to which sense is the primary knowledge of particulars, memory is the retention of a sensation, experience is the sum of many memories, induction infers universals, and intelligence is the true apprehension of the universal principles of science, which is rational, deductive, demonstrative, from empirical principles.

This empirical groundwork of Aristotle's logic was accepted by the Epicureans, who endeavored most distinctly the fundamental character of sense knowledge. Their science of objects, processes and data, assembled and combined, forms the background of the inferences and conclusions. On this foundation the empire of mechanics begins with subsequent opinions, or what the moderns call "interpretation." Beneath deductive logic, in the logic of Aristotle and the canonic of the Epicureans, there already lay the logic of perception, or the sensory experience is the origin of all inference and science. It remained for Francis Bacon to develop these beginnings into a new logic of induction. He did not indeed accept the infallibility of sense or of any other operation unaided. He rather held that a method of the new kind was needed. Following Aristotle in this order—sense, memory, intellect—he resolved the whole process of induction into three ministrations:

1. The ministration to sense, aided by observation and experiment. The ministration to memory, aided by registering and arranging the data, and observation and experiment in tables of instances of agreement, difference and concomitant variations.
2. The ministration to intellect or reason, aided by the negative elimination of the obvious errors and of false conclusions. The ministration of deductive reasoning, aided by the analysis of the data of observation and experiment, and in tables of instances of agreement, difference and concomitant variations.
3. The ministration to universal or reason, aided by the negative elimination of the obvious errors and of false conclusions. The ministration of inductive reasoning, aided by the analysis of the data of observation and experiment, and in tables of instances of agreement, difference and concomitant variations.

In short, the comprehensive genius of Bacon widened logic into a general science of inference.
the whole, however, Aristotle, Bacon and Mill, purged from their errors, form one empirical school, gradually growing by adapting itself to the advance of science; a school in which Aristotle was most influenced by Greek deductive Mathematics, Bacon by the rise of empirical physics at the Renaissance, and Mill by the Newtonian combination of empirical facts and mathematical principles in the Principia. From studying this succession of empirical logicians, we cannot doubt that sense, memory and experience are the real origin of inference, analogical, inductive and deductive. The deepest problem of logic is the relation of sense and inference. But we must first consider the mental analysis of inference, and this brings us to conceptual and formal logic.

Aristotle’s logic has often been called formal logic; it was really a technical logic of syllogism analysed into linguistic elements, and of science rested on an empirical basis. At the same time his psychology, though maintaining his empiricism, contained some seeds of conceptual logic, and indirectly of formal logic. Intellectual development, which according to the logic of the Analytics consists of sense, memory, experience, induction and intellect, according to the psychology of the De Anima consists of sense, imagination and intellect, and one division of intellect is into conception of the undivided and combination of conceptions as one (De An. iii. 6). The De Interpretatione opens with a reference to this psychological distinction, implying that names represent conceptions, propositions represent combinations of conceptions. But the same passage relegates conceptions and their combinations to the De Anima, and confines the De Interpretatione to names and propositions in conformity with the linguistic analysis which pervades the logical treatises of Aristotle, who neither brought his psychological distinction between conceptions and their combinations into his logic, nor advanced the combinations of conceptions as a definition of judgment (kóitos), nor employed the mental distinction between conceptions and judgments as an analysis of inference, or reasoning, or syllogism: he was no conceptual logician. The history of logic shows that the linguistic distinction between terms and propositions was the sole analysis of reasoning in the logical treatises of Aristotle; that the mental distinction between conceptions (ébouna) and judgments (di'éwopos) in a wide sense was imported into logic by the Stoics; and that this mental distinction became the logical analysis of reasoning under the authority of St Thomas Aquinas. In his commentary on the De Interpretatione, St Thomas, after citing from the De Anima Aristotle’s “duplex operatio intellectus,” said, “Additur autem et tertia operatio, scilicet ratiocinatio,” and concluded that, since logic is a rational science (rationalis scientia), its consideration must be directed to all these operations of reason. Hence arose conceptual logic; according to which conception is a simple apprehension of an idea without belief in being or not being, e.g. the idea of man or of running; judgment is a combination of conceptions, adding being or not being, e.g. man is running or not running; and reasoning is a combination of judgments: conversely, there is a mental analysis of reasoning into judgments, and judgment into conceptions, beneath the linguistic analysis of rational discourse into propositions, and propositions into terms. Logic, according to this new school, which has by our time become an old school, has to co-ordinate these three operations, direct them, and, beginning with conceptions, combine conceptions into judgments, and judgments into inference, which thus becomes a complex combination of conceptions, or, in modern parlance, an extension of conceptual logic. Logical inference, indeed, from the first aware that sense supplies the data, and that therefore inference contains belief that things are or are not. But they held, and still hold that sensation and conception are alike mere apprehensions, and that the belief that things are or are not arises somehow after sensation and conception in judgment, from which it passes into inference. At first, they were more sanguine of extracting from these unpromising beginnings some knowledge of things beyond ideas. But at length many of them became formal logicians, who held that logic is the investigation of formal thinking, or consistent conception, judgment and reasoning; that it shows how we infer formal truths of consistency without material truth of signifying things; that, as the science of the form or process, it must entirely abstract from the matter, or objects, of thought; and that it does not tell us how we infer from experience. Thus has logic drifted further and further from the real and empirical logic of Aristotle the founder and Bacon the reformer of the science.

The great merit of conceptual logic was the demand for a mental analysis of reasoning, and the direct analysis of reasoning into judgments which are the sole premises and conclusions of reasoning and of all mental inferences. Aristotle had fallen into the paradox of resolving a mental act into verbal elements. The Schoolmen, however, gradually came to realize that the result to their logic was to make it a sermocinatus scientia, and to their metaphysics the danger of nominalism. St Thomas made a great advance by making logic throughout a rationalis scientia; and logicians are now agreed that all reasoning consists of judgments, discourse of propositions. This distinction is, moreover, vital to the whole logic of inference, because as we always think all the judgments of which our inference consists, but seldom state all the propositions by which it is expressed. We omit propositions, curtail them, and even express a judgment by a single term, e.g. “Good!” “Fire!” Hence the linguistic expression is not a true measure of inference; and to say that an inference consists of two propositions causing a third is not strictly true. But to say that it is two judgments causing a third is always true, and the very essence of inference, because we must think the two to conclude the third in “the sessions of sweet silent thought.” Inference, in short, consists of actual judgments capable of being expressed in propositions. But judgment does not always consist of conceptions. It is not a combination of conceptions; it does not arise from conceptions, nor even at first require conception. Sense is the origin of judgment. One who feels pain, who sees the coloured, who hears the sounding, who sees the coloured, or is conscious, already believes that something sensible exists before conception, before inference, and before language. The idea is the idea of something sensible, the sensible thing, e.g. the hot felt in touch. But a belief in the existence of something is a judgment and a categorical judgment of existence. Sense, then, outer and inner, or sensation and consciousness, is the origin of sensory judgments, and of the sensible possible things; and primary judgments are such true categorical sensory beliefs that things exist, and neither require conception nor are combinations of conceptions. Again, since sense is the origin of sensory judgments, and since sensory judgments require sensory belief, and since sensory belief is the origin of sensations, the sensory premises, and hence primary judgments, which so far as they report sensory judgments are always true. Finally, since sense, memory and experience are the origin of inference, primary inference is categorical and existential, i.e., however, a condition, mental and existential judgments are premises, and proceeding to inferential judgments as conclusions, which are categorical and existential, and are true, so far as they depend on sense, memory and experience.

The sense, then, is the origin of judgment; and the consequence is that primary judgments are true, categorical and existential judgments of sense, and primary inferences are infersences from categorical and existential premises to categorical and existential conclusions, which are as true and inner sense, and proceed to things similar to sensible things. All other judgments and inferences about existing things, or ideas, or names, whether categorical or hypothetical, are afterthoughts, parallel and partial.

Sense, then, because it involves a true belief in existence is fitted to be the origin of judgment. Conception on the other hand is the simple apprehension of an idea, particular or universal, but without belief that anything is or is not, and therefore is unfitted to beget judgment. Nor could a combination of conceptions make a difference so fundamental as that between conceiving and believing. The most that it could do would be to cause an ideal judgment, e.g. that the idea of a cat is a cat. But since there is yet some further origin is needed for the addition of the copula "is." So far from being a cause, conception is not even a condition of all judgments; a sensation of hot is sufficient evidence that hot exists, before the idea of hot is born. Such are the conditions of a formal conception, and the condition of a memorial judgment: in order to remember being hot, we require an idea of hot. Memory, however, is not that idea, but involves a judgment that there previously existed the hot now represented by the idea; and it is about the sensible thing beyond the conceived idea; and the cause of this
memorial judgment is past sense and present memory. So sense, memory and experience, the sum of sense and memory, though requiring conception, are the causes of the experiential judgment that there exist and have existed many similar, sensible things, and these things resemble one another. To these causes is added the existence of past and present sensible things beyond conceived ideas become the particular premises of primary judgment. Starting from these premises, inference is enabled to draw conclusions which are inferential from existence. What does it mean to say that the existence of past and present sensible things beyond conceived ideas is an existence of past and present? How do we know that? How do we know that the idea, conception, men, etc. exist? This universal premise requires a universal conception of a class or whole number of similar particulars, as a condition. But the premise is not that conception; it is a belief that there is a whole number of similar particulars. Thus the conditions of universal premise require a generalization of a class is not, as the conceptual logic assumes, the abstraction of a general idea, but an inference from the analogy of a whole individual thing, e.g. a man, a whole number of similar individuals. The general idea of all men or the combination that the idea of all men is similar to the idea of particular men would not be enough; the universal premise that all men in fact are similar to those who have died is required to induce the universal conclusion that all men in fact die. Universal inference requires particular and universal conceptions as its condition; but, so far as it arises from sense, memory, experience, and involves generalization, it consists of judgments which do not consist of concepts, but are beliefs in things existing beyond concepts. They are, therefore, the formation of judgments that are not judgments in the same sense, memory, and experience; while conception is a condition of some judgments. (2) A judgment that is not a combination either of its causes or of its conditions, e.g. it is not a combination of universal premises, as it, is not a judgment, but a mental act, dividing not itself but its object into the object itself and itself as determined, and signifying that it is so determined. (4) A primary judgment is a judgment that a sensible thing is inferred to be or to exist from judgments of its causes of condition. What is inference, how does it proceed by combining judgments as premises to cause judgments as conclusions, and what are its various kinds? How does inference draw conclusions more or less probable to moral certainty? How does it by the aid of identification convert probable into necessary conclusions, which become necessary principles of demonstration? How is categorical succeeded by conditional inference? What is scientific method as a system of inferences about definite subjects? How does inference become the source of error and fallacy? How does the whole process from sense to discover the true extent of judgments, which are true so far as they signify things known by sense, memory, and experience? These are the fundamental questions of the science of inference. Conceptual logic, on the other hand, is false from its foundation, inasmuch as it is based upon the fallacy of forming conceptions signified by terms, because sense is a prior cause of judgment and inference. It is not the second business of logic to direct us how out of conclusions to form judgments signified by propositions, because the real causes of judgments are sense, memory, and experience. It is, however, the main business of logic to direct us how out of judgments to form inferences signified by discourse; and this is the one point which conceptual logic has contributed to the science of inference. But why spoil the further mental analysis of inference by supposing that conceptions are constituents of judgment and therefore of inference, which thus becomes merely a complex combination of conceptions, an extension of ideas? The mistake has been to convert three operations of mind into three processes in a fixed order—conception, judgment, inference. Conception and judgment are decisions; inference alone is a process. Conceptual logic is the original sense of concept, the original sense, not conception, is the origin of judgment. Inference is the process which from judgments about sensible things proceeds to judgments about things similar to sensible things. Though some conceptions are its conditions and some judgments its causes, inference itself in its conclusions causes many more judgments and conceptions. Finally, inference is an extension, not of ideas, but of beliefs, at first about existing things, afterwards about ideas, and even about words; about anything in short about which we think, in what is so fancifully called the "universe of discourse."

Formal logic has arisen out of the narrowness of conceptual logic. The science of inference no doubt has to deal primarily with formal truth or the consistency of premises and conclusion. But as all truth, real as well as formal, is consistent, formal ruler
of consistency become real rules of truth, when the premises are true and the consistent conclusion is therefore true. The science of inference again rightly emphasizes the formal thinking of the syllogism in which the combination of premises involves the conclusion. But the combinations of premises in analogical and inductive inference, although the combination does not involve the conclusion, yet causes us to infer it, and in so similar a way that the science of inference is not complete without investigating all the combinations which characterize different kinds of inference. The question of logic is how we infer in fact, as well as perfectly; and we cannot understand inference unless we consider inferences of probability of all kinds. Moreover, the study of analogical and inductive inference is necessary to that of the syllogism itself, because they discover the premises of syllogism. The formal thinking of syllogism alone is merely necessary consequence; but when its premises are necessary principles, its conclusions are not only necessary consequences but also necessary truths. Hence the manner in which induction aided by identification discovers necessary principles must be studied by the logician in order to decide whether conclusions are necessary and well-arrived at necessarily. Again, the science of inference has for its subject the form, or processes, of thought, but not its matter or objects. But it does not follow that it can investigate the former without the latter. Formal logicians say that, if they had to consider the matter, they must either consider all things, which would be impossible, or select some, which would be arbitrary. But there is an intermediate alternative, which is neither impossible nor arbitrary; namely, to consider the general distinctions and principles of all things; and without this general consideration of the matter the logician cannot know the form of thought, which consists in drawing inferences about things on these general principles. Lastly, the science of inference is not indeed the science of sensation, memory and experience, but at the same time it is the science of using those mental operations as data of inference; and, if logic does not show how analogical and inductive inferences directly, and deductive inferences indirectly, arise from experience, it becomes a science of mere thinking without knowledge.

Logic is related to all the sciences, because it considers the common inferences and varying methods used in investigating different subjects. But it is most closely related to the sciences of metaphysics and psychology, which form with it a triad of sciences. Metaphysics is the science of being in general, and therefore of the things which become objects apprehended by our minds. Psychology is the science of mind in general, and therefore of the mental operations, of which inference is one. Logic is the science of the processes of inference. These three sciences, of the objects of mind, of the operations of mind, of the processes used in the inferences of mind, are all different, but closely related, so that they are constantly confused. The real point is their interdependence, which is so intimate that one sign of great philosophy is a consistent metaphysics, psychology and logic. If the world of things is known to be partly mental and partly material, the mind possesses a variety of sense and inference enabling it to know these things, and must be processes of inference carrying us from and beyond the sensible to the insensible world of matter and mind. If the whole world of things is matter, operations and processes of mind are themselves material. If the whole world of things is mind, operations and processes of mind have only to recognize their like all the world over. It is clear then that a man's metaphysics and psychology must colour his logic. It is accordingly necessary to the logician to know beforehand the general distinctions and principles of things in metaphysics, and the mental operations of sense, conception, memory and experience in psychology, so as to discover the processes of inference from experience about things in logic.

The interdependence of this triad of sciences has sometimes led to their confusion. Hegel, having identified being with thought, merged metaphysics in logic. But he divided logic into objective and subjective, and thus practically confessed that there is one science of the objects and another of the processes of thought. Psychologists, seeing that inference is a mental operation, often extemporize a theory of inference to the neglect of logic. But we have a double consciousness of inference. We are conscious of it as one operation among many, and of its omnipresence, so to speak, to all the rest. But we are also conscious of the processes of the operation of inference. To a certain extent this second consciousness applies to other operations: for example, we are conscious of the process of association by which various mental causes recall ideas in the imagination. But how little does the psychologist know about the association of ideas, compared with what the logician has discovered about the processes of inference! The fact is that our primary consciousness of all mental operations is hardly equal to our secondary consciousness of the processes of the one operation of inference from premises to conclusions permeating long trains and pervading whole sciences. This elaborate consciousness of inferential process is the justification of logic as a distinct science, and is the first step in its method. But it is not the whole method of logic, which also and rightly considers the mental process necessary to language, without substituting linguistic for mental distinctions.

Nor are consciousness and linguistic analysis all the instruments of the logician. Logic has to consider the things we know, the minds by which we know them from sense, memory and experience to inference, and the sciences which systematize and extend our knowledge of things; and having considered these facts, the logician must make such a science of inference as will explain the power and the poverty of human knowledge.

**General Tendencies of Modern Logic**

There are several grounds for hope in the logic of our day. In the first place, it tends to take up an intermediate position between the extremes of Kant and Hegel. It does not, with the former, regard logic as purely formal in the sense of abstracting thought from being, nor does it follow the latter in amalgamating metaphysics with logic by identifying being with thought. Secondly, it does not content itself with the mere formulae of thinking, but pushes forward to theories of method, knowledge and science; and it is a hopeful sign to find this epistemological spirit, to which England was accustomed by Mill, animating German logicians such as Lotze, Dühring, Schuppe, Sigwart and Wundt. Thirdly, there is a determination to reveal the psychological basis of logical processes, and not merely to describe them as they are in adult reasoning, but to explain also how they arise from simpler mental operations and primarily from sense. This attempt is connected with the psychological turn given to recent philosophy by Wundt and others, and is dangerous only so far as psychology itself is hypothetical. Unfortunately, however, these merits are usually connected with a less admirable characteristic—contempt for tradition. Writing his preface to his second edition in 1888, Sigwart says: "Important works have appeared by Lotze, Schuppe, Wundt and Bradley, to name only the most eminent; and all start from the same point of view. But the contemporary attempt that it is a new logic is grounded by them, not upon an effete tradition but upon a new investigation of thought as it actually is in its psychological foundations, in its significance for knowledge, and its actual operation in scientific methods." How strange! The spirit of every one of the three reforms above enumerated is an unconscious return to Aristotle's *Organon*. Aristotle's was a logic which steered, as Trendelenburg has shown, between Kantian formalism and Hegelian metaphysics; it was a logic which in the Analytics investigated the syllogism as a means to understanding knowledge and science: it was a logic which, starting from the psychological foundations of sense, memory and experience, built up the logical structure of induction and deduction on the profoundly Aristotelian principle that "there is no process from universals without induction, and none by induction without sense." Wundt's comprehensive view that logic looks backwards to psychology and forward to epistemology was hundreds of years ago one of the many discoveries of Aristotle.
1. Judgment and Conception.—The emphasis now laid on judgment, the recovery from Hume’s confusion of beliefs with ideas and the association of ideas, and the distinction of the mental act of judging from its verbal expression in a proposition, are all healthy signs in recent logic. The most fundamental question, before proceeding to the investigation of inference, is not what we say but what we think in making the judgments which, whether we express them in propositions or not, are both the premises and the conclusion of inference; and, as this question has been diligently studied of late, but has been variously answered, it will be well to give a list of the more important theories of judgment as follows:—

a. It expresses a relation between the content of two ideas, not a relation of these ideas (Lotze).

b. It expresses a consciousness concerning the objective validity of a subjective combination of ideas, i.e. whether between the corresponding objective elements an analogous combination exists (Ueberweg).

c. It is the synthesis of ideas into unity and consciousness of their objective validity, not in the sense of agreement with external reality but in the sense of the logical necessity of their synthesis (Sigwart).

d. It is the analysis of an aggregate idea (Gesamtvorsstellung) into subject and predicate; based on a previous association of ideas, on relating and comparing, and on the apprehensive synthesis of an aggregate idea in consequence; but itself consisting in an apprehensive combination of the aggregate idea; and requiring will in the form of apperception or attention (Wundt).

e. It requires an idea, because every object is conceived as well as recognized or denied; but it is itself an assertion of actual fact, evidence or appraisal, or a judgment, and every categorical is changeable into an existential judgment without change of sense (Brentano, who derives his theory from Mill except that he denies the necessity of a combination of ideas, and reduces a categorical to an existential judgment).

f. It is a decision of the validity of an idea requiring will (Bergmann, following Brentano).

g. Judgment (Urtheil) expresses that two ideas belong together: “by” (zum) (Beurtheilung) is the reaction of will expressing the validity or invalidity of the combination of ideas (Weierstrass, following Bergmann, but distinguishing the decision of validity from the judgment).

h. Judgment is consciousness of the identity or difference and of the causal relations of the given; naming the actual combinations of the data, but also requiring a priori categories of the understanding, the notions of identity, difference and causality, as principles of thought or laws, to combine the plurality of the given into a unity (Schopenhauer).

i. Judgment is the act which refers an ideal content recognized as such to a reality beyond the act, predicating an idea of a reality, a what of a that; so that the subject is reality and the predicate the meaning of an idea, while the aggregate idea refers the idea to reality by an identity of content (Bradley and Bosanquet).

j. Judgment is an assertion of reality, requiring comparison and ideas which render it directly expressible in words (Hobhouse, mainly following Bradley).

These theories are of varying value in proportion to their proximity to Aristotle’s point that predication is about things, and to Mill’s point that judgments and propositions are about things, not about ideas. The essence of judgment is belief that something is (or is not) determined, either as existing (e.g. “I am,” “A centaur is not”) or as something in particular (e.g. “I am a man,” “I am not a monkey”). Neither Mill, however, nor any of the later logicians whose theories we have quoted, has been able quite to detach judgment from conception; they all suppose that an idea, or ideas, is a combination of all judgment. But judgment starts from sensation (Empfindung) and feeling (Gefühl), and not from idea (Vorsstellung). When I feel pleased or pains, or when I use my senses to perceive a pressure, a temperature, a flavour, an odour, a colour, a sound, or when I am conscious of feeling and perceiving, I cannot resist the belief that something sensible is present; and this belief that something exists is already a judgment, a judgment of existence, and, so far as it is limited to sense without inference, a true judgment. It is a matter of words whether or not we should call this sensory belief a judgment; but it is no matter of choice to the logician, who regards all the constituents of inference as judgments; for the fundamental constituents are sensory beliefs, which are therefore judgments in the logical sense. Sense is the evidence of inference; directly of analogical and inductive, indirectly or inversely of deductive, inference; and therefore, if logic refuses to include sensory beliefs among judgments, it will omit the fundamental constituents of inference, inference will no longer consist of judgments but of sensory beliefs plus judgments, and the second part of logic, the logic of judgment, the purpose of which is to investigate the constituents of inference, will be like Hamlet without the prince of Denmark. If, on the other hand, all the constituents of inference are judgments, there are judgments of sense; and the evidence of the senses means that a judgment of sense is true, while a judgment of inference is true so far as it is directly or indirectly concluded from judgments of sense. Now a sensory judgment, e.g. that a sensible pressure is existing, is explained by none of the foregoing theories, because it requires nothing but sensation and belief. It requires no will, but is usually involuntary, for the stimulus forces one’s attention, which is not always voluntary; not all judgment then requires will, as Wundt supposes. It requires no reference to reality beyond the sensible pressure, because it is merely a belief that this exists without inference of the external stimulus or any inference at all: not all judgment then requires the reference of subjective to objective supposed by Ueberweg, or the consciousness of logical necessity supposed by Sigwart. It requires in addition to the belief that something exists, no consideration as to whether the belief itself be true, because a man who feels pressure believes in the thing without further question about the belief: not all judgment then requires a decision of validity, as Bergmann supposes. It requires nothing beyond the sensation and belief in the given existence of the given pressure: not all judgment then requires categories of understanding, or notions of identity, difference and causality, or even of existence, such as Schuppe supposes. It requires no comparison in order to express it in words, for a judgment need not be, expressed, and a sensory judgment of pressure is an irresistible belief that a real pressure exists, without waiting for words, or for a comparison which is wanted not to make a sensation a judgment, but to turn a judgment into language: not all judgments then require comparison with a view to its expression, as supposed by Hobhouse. Lastly, all the authors of the above-quoted theories err in supposing that all judgment requires conception; for even Mill thinks a combination of ideas necessary, and Brentano, who comes still nearer to the nature of sensory judgment when he says, “Every perception counts for a judgment,” yet thinks that an idea is necessary at the same time in order to understand the thing judged. In reality, the sensation and the belief are sufficient; when I feel a sensible pressure, I cannot help believing in its reality, and therefore judging that it is real, without any tertium quid—an idea of pressure, or of existence or of pressure existing—intervening between the sensation and the belief. Only after sensation has ceased does an idea, or representation of what is not presented, become necessary as a substitute for a sensation and as a condition not of the first judgment that there was, something sensible. Otherwise there would be no judgment of sensible fact, for the first sensation would not give rise to an idea following the sensation would be still farther off. The judgment then, which is nothing but a belief that at the moment of sense something sensible exists, is a proof that not all judgment requires conception, or synthesis or analysis of ideas, or decision about the content, or about the validity, of ideas, or reference of an ideal content to reality, as commonly, though variously, supposed in the logic of our day.

Not, however, that all judgment is sensory: after the first judgments of sense follow judgments of memory, and memory requires ideas. Yet memory is not mere conception, as Aristotle, and Mill after him, have perceived. To remember, we must have a present idea; but we must also have a belief that the thing, of which the idea is a representation, was (or was not) determined; and this belief is the memorial judgment. Originally such judgments arise from sensory judgments followed by
JUDGMENT

LOGIC

887

ideas, and are judgments of memory after sense that something sensible existed, e.g., pressure existed: afterwards come judgments of memory after inference, e.g., Caesar was murdered. Finally, most judgments are inferential. These are conclusions which primarily are inferred from sensory and memorial judgments; and so far as inference starts from sense of something sensible in the present, and from memory after sense of something sensible in the past, and concludes similar things, inferential judgments are indirect beliefs in being and in existence beyond ideas. When from the sensible pressures between the parts of my mouth, which I feel and remember and judge that they exist and have existed, I infer another similar pressure (e.g. of the food which presses and is pressed by my mouth in eating), the inferential judgment with which I conclude is a belief that the latter exists as well as the former (e.g. the pressure of food without as well as the sensible pressures within). Inference, no doubt, is closely involved with conception. So far as it depends on memory, an inferential judgment presupposes memorial ideas in its data; and so far as it infers universal classes and laws, it produces general ideas. But even so the part played by conception is quite subordinate to that of belief. In the latter case, the remembered datum, from which an inference of pressure starts, is not the conceived idea, but the belief that the sensible pressure existed. Secondly, the conclusion in which it ends is not the general idea of a class, but the belief that a class, represented by a general idea, exists, and (or is not) otherwise determined (e.g. that things pressing and pressed exist and move). Two things are certain about inferential judgment: one, that when inference is based on sense and memory, inferential judgment starts from a combination of sensory and memorial judgment, both of which are beliefs that things exist; the other, that in consequence inferential judgment is a belief that similar things exist. There are thus three primary judgments: judgments of sense, of memory after sense, and of inference from sense. All these are beliefs in being and existence, and this existential belief is first in sense, and afterwards transferred to memory and inference. Moreover, it is transferred in the same irresistible way: frequently we cannot help either feeling pressure, or remembering it, or inferring it; and as there are involuntary sensation and attention; so there are involuntary memory and judgment. In a judgment existence need not be expressed; but if expressed, it may be expressed either by the predicate, e.g. “I exist,” or by the subject, e.g. “I who exist think.” There are indeed differences between primary judgments, in that the sensory is a belief in present, the memorial in past, and the inferential in present, past and future existence. But these differences in detail do not alter the main point that all these are beliefs in the existing, in the real as opposed to the ideal, in actual things which are not ideas. In short, a primary judgment is a belief in something existing apart from our idea of it; and not because we have an idea of it, or by comparing an idea with, or referring an idea to, reality; but because we have a sensation of it, or a memory of it or an inference of it. Sensation, not conception, is the origin of judgment.

2. Different Significations of Being in different Kinds of Judgment.—As Aristotle remarked both in the De Interpretatione and in the Sophistici Elenchi, “not-being is thinkable” — not-being exists. In the latter treatise he argues that it is a falso un dicum quod ad dictum simpliciter to argue from the former to the latter; “for,” as he says, “it is not the same thing to be something and to exist absolutely.” Without realizing their debt to tradition, Herbart, Mill and recently Sigwart, have repeated Aristotle’s separation of the copula from the verb of existence, as if it were a modern discovery that “is” is not the same as “exists.” It may be added that they do not quite realize what the copula exactly signifies: it does not signify existence, but it does signify a fact, namely, that something is (or is not) determined, either absolutely in a categorical judgment, or conditionally in a conditional judgment. Now we have seen that all primary judgments signify more than this fact; they are also beliefs in the existence of the thing signified by the subject. But, in the first place, primary judgments signify this existence never by the copula, but sometimes by the predicate, and sometimes by the subject; and, secondly, it does not follow that all judgments whatever signify existence. Besides inference of existence there is inference of non-existence, of things inconsistent with the objects of primary judgments. Hence secondary judgments, which no longer contain a belief that the thing exists, e.g., the judgment, “not-being is thinkable,” cited by Aristotle; the judgment, “A square circle is impossible,” cited by Herbart; the judgment, “A centaur is a fiction of the poets,” cited by Mill. These secondary judgments of non-existence are partly like and partly unlike primary judgments of existence. They resemble them in that they are beliefs in being signified by the copula. They are beliefs in things of a sort; for, after all, ideas and names are things; their objects, even though non-existent, are at all events things conceivable or nameable; and therefore we are able to make judgments that things, non-existent but conceivable or nameable, are (or are not) determined in a particular manner. Thus the judgment about a centaur is the belief, “A conceivable centaur is a fiction of the poets,” and the judgment about a square circle is the belief, “A conceivable square circle is an impossibility.” But, though beliefs that things of some sort are (or are not) determined, these secondary judgments fall short of primary judgments of existence. Whereas in a primary judgment there is a further belief, signified by subject or predicate, that the thing is an existing thing in the sense of being a real thing (e.g. a man), different from the idea of it as well as from the name for it; in a secondary judgment there is no further belief that the thing has any existence beyond the idea (e.g. a centaur), or even beyond the name (e.g. a square circle): though the idea or name exists, there is no belief that anything represented by idea or name exists. Starting, then, from this fundamental distinction between judgments of existence and judgments of non-existence, we may hope to steer our way between two extreme views which emanate from two important thinkers, each of whom has produced a flourishing school of psychological logic.

On the one hand, early in the 19th century Herbart started the view that a categorical judgment is never a judgment of existence, but always hypothetical; on the other hand, in the latter part of the century Brentano started the view that all categorical judgments are existential. The truth lies between these contraries. The view of Herbart and his school is contradicted by our primary judgments of and from sense, in which we cannot help believing existence; and it gives an inadequate account even of our secondary judgments in which we no longer indeed believe existence, but do frequently believe that a non-existent thing is (or is not) somehow determined unconditionally. It is true, as Herbart says, that the judgment, “A square circle is an impossibility,” does not contain the belief, “A square circle is existent”; but when he goes on to argue that it means, “If a square circle is thought, the conception of impossibility must be added in thought,” he falls into a non-sequitur. To be categorical, a judgment does not require a belief in existence, but only that something, existent or not, is (or is not) determined; and there are two quite different attitudes of mind even to a non-existent thing, such as a square circle, namely, unconditional and conditional belief. The judgment, “A non-existent but called square circle is an impossibility,” is an unconditional, or categorical judgment of non-existence, quite different from any hypothetical judgment, which depends on the conditions “if it is thought,” or “if it exists,” or any other “if.” On the other hand, the view of Brentano and his school is contradicted by these very categorical judgments of non-existence; and while it applies only to categorical judgments of existence, it does so inadequately. To begin with the latter objection, Brentano proposed to change the four Aristotelian forms of judgment, A, E, I, O, into the following existential forms:—

A. “There is not an immortal man.”
E. “There is not a live stone.”
I. “There is a sick man.”
O. “There is an unlearned man.”
This reconstruction, which merges subject and predicate in one expression, in order to combine it with the verb of existence, is repeated in similar proposals of recent English logicians. Venn, in his *Symbolic Logic*, proposes the four forms, $xy, x\rightarrow y, y\rightarrow x, x\Rightarrow y$ (where $\Rightarrow$ means "not-$\gamma$"), but only as alternative to the ordinary forms. Bradley says that "$S-P$ is real" attributes $S-P$, directly or indirectly, to the ultimate reality," and agrees with Brentano that "$S-P$ is never stands for anything but "exists" $S-P$"; while Bosanquet, who follows Bradley, goes so far as to define a categorical judgment as "that which affirms the existence of its subject, or, in other words, asserts a fact." Now it is true that our primary judgments do contain a belief in existence; but they do not all contain it in the same way, but are beliefs sometimes that something is determined as existing, and sometimes that something existing is particularly determined. Brentano's forms do not express such a judgment of existence, as "all existing men are mortal"; nor does Bradley's form, "reality includes $S-P$." Metaphysically, all realities are parts of one ultimate reality; but logically, even philosophers think more often only of finite realities, existing men, dogs, horses, &c.; and children know that their parents exist long before they apprehend ultimate reality. The normal form, then, of a judgment of existence is either "$S$ is a real $P$," or "a real $S$ is $P$." Hence the reconstruction of all categorical judgments by merging subject and predicate, either on Brentano's or Bradley's plan, is a misrepresentation even of normal categorical judgments of existence. Secondly, it is much more a misrepresentation of categorical judgments of non-existence.

No existential form suits a judgment such as "a centaur is a fiction," when we do not believe that there is a centaur, or that reality includes a centaur. As Mill pointed out, it cannot be implied that a centaur exists, since the very thing asserted is that the thing has no real existence. In a correspondence with Mill, Brentano rejoined that the centaur exists in imagination; Bradley says, "inside our heads." According to one, then, the judgment becomes "there is an imaginary centaur"; according to the other "reality includes an imaginary centaur." The rejoinder, however, though partly true, is not to the point. The idea of the centaur does exist in our imagination, and inside our heads, and the name of it in our mouths. But the point is that the centaur conceived and named does not exist beyond the idea of it and the name for it; it is not, like a man, a real thing which is neither the idea of it nor the name for it. No amount of subtlety will remove the difference between a categorical judgment of existence, e.g., "an existing man is mortal," and a categorical judgment of non-existence, e.g., "a conceivable centaur is a fiction," because in the former we believe in the being of the thing beyond the idea, and in the latter we do not. If, contrary to usage, we choose to call the latter a judgment of existence, there is no use in quarrelling about words; but we must insist that new terms must in that case be invented to express so fundamental a difference as that between judgments about real men and judgments about ideal centaurs. So long, however, as we use words in the natural sense, and call the former judgments of existence, and the latter judgments of non-existence, then "is" will not be, as Bradley supposes, the same as "exists," for we use "is" in both judgments, but "exists" only in the first kind. Bosanquet's definition of a categorical judgment contains a similar confusion. To assert a fact and to affirm the existence of a subject are not, as he makes out, the same thing: a judgment often asserts a fact and denies existence in the same breath, e.g., "Jupiter is non-existent." Here, as usual in logic, tradition is better than innovation. All categorical judgment is an unconditional belief in the fact, signified by the copula, that a thing of some sort is (or is not) determined; but some categorical judgments are also beliefs that the thing is an existing thing, signified either by the subject or by the predicate, while others are not beliefs that the thing exists at all, but are only beliefs in something conceivable, or nameable, or in something or other, without particularizing what. Judgment then always signifies being, but not always existence.

3. Particular and Universal Judgments.—Aristotle, by distinguishing affirmative and negative, particular and universal, made the fourfold classification of judgments, $A$, $E$, $I$, $O$, on foundation both of opposition and of inference. With regard to inference, he remarked that a universal judgment means by "all," not every individual we know, but every individual absolutely, so that, when it becomes a major premise, we know therein every individual universally, not individually, and often do not know a given individual individually until we add a minor premise in a syllogism. Whereas, then, a particular judgment is a belief that some, a universal judgment is a belief that all, the individuals of a kind or total of similar individuals, are similarly determined, whether they are known or unknown individuals. Now, as we have already seen, what is signified by the subject may be existing or not, and in either case a judgment remains categorical so long as it is a belief without conditions. Thus, "Some existing men are poets," "All existing men are mortal," "Some conceivable centaurs are human in their forequarters," "All conceivable centaurs are equine in their hindquarters," are all categorical judgments, while the two first are also categorical judgments of existence. Nevertheless these obvious applications of Aristotelian traditions have been recently challenged, especially by Sigwart, who holds in his *Logic* (secs. 27, 36) that, while a particular is a categorical judgment of existence, a universal is hypothetical, on the ground that it does not refer to a definite number of individuals, or to individuals at all, but rather to general ideas, and that the appropriate form of "all $M$ is $P$" is "if anything is $M$ it is $P$." This view, which has influenced not only German but also English logicians, such as Venn, Bradley and Bosanquet, destroys the fabric of inference, and reduces scientific laws to mere hypotheses. In reality, however, particular and universal judgments are too closely connected to have such different imports. In opposition, a categorical particular is the contradictory of a universal, which is also categorical, not hypothetical, e.g., "not all $M$ is $P$" is the contradictory of "all $M$ is $P$," and not of "if anything is $M$ it is $P$." In inference, a particular is an example of a universal which in its turn may become a particular example of a higher universal. For instance, in the history of mechanics it was first inferred from some that all terrestrial bodies gravitate, and then from these as some that all ponderable bodies, terrestrial and celestial, gravitate. How absurd to suppose that here we pass from a particular categorical to a universal hypothetical, and then treat this very conclusion as a particular categorical to pass to a higher universal hypothetical! Sigwart, indeed, is deceived both about particulars and universals. On the one hand, some particulars of Aristotelian delimitation (e.g., "imagination is a power of the imaginary delimitation of gods;" on the other hand, some universals are not judgments of non-existence, e.g., "every existing man is mortal." Neither kind is always a judgment of existence, but each is sometimes the one and sometimes the other. In no case is a universal hypothetical, unless we think it under a condition; for in a universal judgment about the non-existing, e.g., about all conceivable centaurs, we do not think, "if anything is a centaur," because we do not believe that there are any; and in a universal judgment about the existent, e.g., about all existing men, we do not think, "if anything is a man," because we believe that there is a whole class of men existing at different times and places. The cause of Sigwart's error is his misconception of "all." So far as he follows Aristotle in saying that "all" does not mean a definite number of individuals he is right; but when he says that we mean no individuals at all he deserts Aristotle and goes wrong. By "all" we mean every individual whatever of a kind; and when from the experience of sense and memory we start with particular judgments of existence, and infer universal judgments of existence and scientific laws, we further mean those existing individuals which we have experienced, and every individual whatever of the kind which exists. We mean neither a definite number of individuals, nor yet an infinite number, but an incalculable number, whether experienced or inferred to exist. We do not mean existing here and now, nor yet out of time and place, but at any time and place (semmber et ubique)—
past, present and future being treated as simply existing, by what logicians used to call suppositio naturalis. We mean then by "all existing" every similar individual whatever, wherever, and wherever existing. Hence Sigwart is right in saying that "All bodies are extended" means "Whatever is a body is extended," but wrong in identifying this form with "If anything is a body it is extended." "Whatever" is not "if anything." For the same reason it is erroneous to confound "all existing" with a general idea. Nor does the use of abstract ideas and terms make any difference. When Bosanquet says that in "Heat is a mode of motion" there is no reference to individual objects, but "a pure hypothetical form which absolutely neglects the existence of objects," he falls far short of expressing the nature of this scientific judgment, for in his Theory of Heat Clerk Maxwell describes it as "believing heat as it exists in a hot body to be in the form of kinetic energy." As Bacon would say, it is a belief that all individual bodies qua hot are individually but similarly moving in their particles. When, again, Bradley and Bosanquet speak of the universal as if it always meant one ideal content referred to reality, they forget that in universal judgments of existence, such as "All men existing are mortal," we believe that every individually existing man dies his own death individually, though similarly to other men; and that we are thinking neither of ideas nor of reality; but of all existent individual men being individually but similarly determined. A universal is indeed one whole; but it is one whole of many similars, which are not the same with one another. This is indeed the very essence of distribution, that a universal is predicable, not singly or collectively, but severally and similarly of each and every individual of a kind, or total of similar individuals. So also the essence of a universal judgment is that every individual of the kind is severally but similarly determined. Finally, a universal judgment is often existential; but whether it is so or not it remains categorical, so long as it introduces no hypothesis except antecedent one. And it is thus described by the subject. It is true that even in universal judgments of existence there is often a hypothetical element; for example, "All men are mortal" contains a doubt whether every man whatever, whenever and wherever existing, must die. But this is only a doubt whether all the things signified by the subject are similarly determined as signified by the predicate, and not a doubt whether there are such things at all. Hence the hypothetical element is not a hypothetical antecedent "If anything is a man," but an uncertain conclusion that "All existing men are mortal." In other words, a categorical universal is often problematic, but a problematic is not the same as a hypothetical judgment.

4. The Judgment and the Proposition.—Judgment in general is the mental act of believing that something is (or is not) determined. A proposition is the consequent verbal expression of such a belief, and consists in asserting that the thing as signified by the subject is (or is not) determined as signified by the predicate. But the expression is not necessary. Sensation irresistibly produces a judgment of existence without needing language. Children think long before they speak; and indeed, as mere vocal sounds are not speech, and as the apprehension that a word signifies a thing is a judgment, judgment is originally not an effect, but a cause of significant language. At any rate, even when we have learnt to speak, we do not express all we think, as we may see not only from the farness of words known to a child, but also from our own adult consciousness. The principle of thought is to judge enough to conclude. The principle of language is to speak only so far as to understand and be understood. Hence speech is only a curtained expression of thought. Sometimes we express a whole judgment by one word, e.g. "Fire!" or by a phrase, e.g. "What a fire!" and only usually by a proposition. But even the normal proposition in the syntagm term subject, predicate and copula, is seldom a complete expression of the judgment. The consequence is that the proposition, being different from a judgment arising after a judgment, and remaining an imperfect copy of judgment, is only a superficial evidence of its real nature. Fortunately, we have more profound evidences, and at least three evidences in all: the linguistic expression of belief in the proposition; the consciousness of what we mentally believe; and the analysis of reasoning, which shows what we must believe, and have believed, as data for inference. In these ways we find that a judgment is both different from, and more than, a proposition. But recent logicians, although they perceive the difference, nevertheless tend to make the proposition the measure of the judgment. This makes them omit sensory judgments, and count only those which require ideas, and even general ideas expressed in general terms. Sigwart, for example, gives as instances of our most elementary judgments, "This is Socrates," "This is snow."—beliefs in things existing beyond ourselves which require considerable inferences from many previous judgments of sense and memory. Worse still, logicians seem unable to keep the judgment apart from the proposition. Herbert says that the judgment 'A is B' does not contain the usually added thought that A is, because there is no statement of A's existence; as if the statement mattered to the thought. So Sigwart, in order to reduce universals to hypotheticals, while admitting that existence is usually thought, argues that it is not stated in the universal judgment; so also Bosanquet. But in the judgment the point is not what we state, but what we think; and so long as the existence of a A is added in thought, the judgment in question must contain the thought that A exists as well as that A is B, and therefore is a judgment that something is determined both as existing and in a particular manner. The statement only affects the proposition; and whenever we believe the existence of the thing, the belief in existence is part of judgment thought, whether it is part of the proposition stated or not.

Here Sir William Hamilton did a real service to logic in pointing out that a logical postulate to validly explain all language that all is implicitly contained in judgment. Not that men should or can carry this logical postulate out of ordinary life; but it is necessary in the logical analysis of judgments, and yet it does not concern them as they are expressed in the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical. Taking the carelessy expressed propositions of ordinary life, they do not perceive that similar judgments are often differently expressed, e.g. I, being a man, and being mortal, versus the belief that the universal with the hypothetical.
Now, in all judgment we think "is," but in few judgments predicate "equal to." In quantitative judgments we may think $x = y$, or, as Boole proposes, $x + y = 0$, or, as Jevons proposes, $x = xy$, or, as Venn proposes, $x$ which is not $y = 0$; and equalitarian symbolic logic is useful whenever we think in this quantitative way. But it is a byway of thought. In most judgments all we believe is that $x$ is (or is not) $y$, that a thing is (or is not) determined, and that the thing signified by the subject is a thing signified by the predicate, but not that it is the only thing, or equal to everything signified by the predicate. The symbolic logic, which confuses "is" with "equal to," having introduced a particular kind of predicate into the copula, falls into the mistake of reducing all predication to the one category of the quantitative; whereas it is more often in the substantial, e.g. "I am a man," not "I am equal to a man," or in the qualitative, e.g. "I am white," not "I am equal to white," or in the relative, e.g. "I am born in sin," not "I am equal to born in sin." Predications as Aristotelian, or as various as the categories of being. Finally the great difficulty of the logic of judgment is to find the mental act behind the linguistic expression, to ascribe to it exactly what is thought, neither more nor less, and to apply the judgment thought to the logical proposition, without expecting to find it in ordinary propositions. Beneath Hamilton's postulate there is a deeper principle of logic—A rational being thinks only to the point, and speaks only to understand and be understood.

**Inference**

The nature and analysis of inference have been so fully treated in the Introduction that here we may content ourselves with some points of detail.

1. **False Views of Syllogism arising from False Views of Judgment.**—The false views of judgment, which we have been examining, have led to false views of inference. On the one hand, having reduced categorical judgments to an existential form, Brentano proposes to reform the syllogism, with the results that it must contain four terms, of which two are opposed and two appear twice; that, when it is negative, both premises are negative; and that, when it is affirmative, one premise, at least, is negative. In order to infer the universal affirmative that every professor is mortal because he is a man, Brentano's existential syllogism would run as follows:

- There is not a not-mortal man.
- There is not a not-human professor.
- There is not a not-mortal professor.

On the other hand, if on the plan of Sigwart's categorical universals were reducible to hypotheticals, the same inference would be a pure hypothetical syllogism, thus:

- If anything is a man it is mortal.
- If anything is a professor it is a man.
- If anything is a professor it is mortal.

But both these unnatural forms, which are certainly not analyses of any conscious process of categorical reasoning, break down at once, because they cannot explain those moods in the third figure, e.g. *Darapti*, which reason from universal premises to a particular conclusion. Thus, in order to infer that some wise men are good from the example of professors, Brentano's syllogism would be the following *non-sequitur*:

- There is not a not-good professor.
- There is not a not-wise professor.
- There is a wise good (non-sequent).

So Sigwart's syllogism would be the following *non-sequent*:

- If anything is a professor, it is good.
- If anything is a professor, it is wise.
- Something wise is good (non-sequent).

But as by the admission of both logicians these reconstructions of *Darapti* are illogical, it follows that their respective reductions of categorical universals to existentials and hypotheticals are false, because they do not explain an actual inference. Sigwart does not indeed shrink from this and greater absurdities; he reduces the first figure to the *modus ponens* and the second to the *modus tollens* of the hypothetical syllogism, and then, finding no place for the third figure, denies that it can infer necessity; whereas it really infers the necessary consequence of particular conclusions. But the crowning absurdity is that, if all universals were hypothetical, *Barbara* in the first figure would become a purely hypothetical syllogism—a consequence which seems innocent enough until we remember that all universal affirmative conclusions in all sciences would with their premises dissolve into mere hypothesis. No logic can be sound which leads to the following analysis:

- If anything is a body it is extended.
- If anything is a planet it is a body.
- If anything is a planet it is extended.

Sigwart, indeed, has missed the essential difference between the categorical and the hypothetical construction of syllogisms. In a categorical syllogism of the first figure, the major premise, "Every M whatever is P," is a universal, which we believe on account of previous evidence without any condition about the thing signified by the subject M, which we simply believe sometimes to be existent (e.g. "Every man existent"), and sometimes not (e.g. "Every centaur conceivable"); and the minor premise, "S is M," establishes no part of the major, but adds the evidence of a particular not thought of in the major at all. But in a hypothetical syllogism of the ordinary mixed type, the first or hypothetical premise is a conditional belief, e.g. "If anything is M it is P," containing a hypothetical antecedent, "If anything is M," which is sometimes a hypothesis of existence (e.g. "If anything is an angel"), and sometimes a hypothetical condition, e.g. "If any existing man is wise"; and the second premise or assumption, "Something is M," establishes part of the first, namely, the hypothetical antecedent, whether as regards existence (e.g. "Something is an angel"), or as regards fact (e.g. "This existing man is wise"). These very different relations of premises are obliterated by Sigwart's false reduction of categorical universals to hypotheticals. But even Sigwart's errors are outdone by Lotze, who not only reduces "Every M is P" so "If S is M, S is P," but proceeds to reduce this hypothetical to the disjunctive, "If S is M, S is P or P or P," and finds fault with the Aristotelian syllogism because it contains itself with inferring "S is P" without showing what P. Now there are occasions when we want to reason in this disjunctive manner, to consider whether S is P or P or P, and to conclude that "S is a particular P," but ordinarily all we want to know is that "S is P," e.g. in arithmetic, that $2 + 2$ are 4, not any particular 4, and in life that all our contemporaries must die, without enumerating all their particular sorts of deaths. Lotze's mistake is the same as that of Hamilton about the quantification of the predicate, and that of those symbolists who held that reasoning ought always to exhaust all alternatives by equations. It is the mistake of exaggerating exceptional into normal forms of thought, and ignoring the principle that a rational being thinks only to the point.

2. **Quasi-syllogisms.**—Besides reconstructions of the syllogistic fabric, we find in recent logic attempts to extend the figures of the syllogism beyond the syllogistic rules. An old error that we may have a valid syllogism from merely negative premises (ex omnibus negativis), long ago answered by Alexander and Boethius, is now revived by Lotze, Jevons and Bradley, who do not perceive that the supposed second negative is really an affirmative containing a "not" which can only be carried through the syllogism by separating it from the copula and attaching it to one of the extremes, thus:

- The just are not unhappy (negative).
- The just are not-recognized (affirmative).
- Some not-recognized are not unhappy (negative).

Here the minor being the infinite term "not-recognized" in the conclusion, must be the same term also in the minor premise. Schuppe, however, who is a fertile creator of quasi-syllogisms, has managed to invent some examples from two negative premises of a different kind:

<table>
<thead>
<tr>
<th>Premise 1</th>
<th>Premise 2</th>
<th>Conclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) No M is P.</td>
<td>(2) No M is P.</td>
<td>(3) No P is M.</td>
</tr>
<tr>
<td>S is not M.</td>
<td>S is not M.</td>
<td>S is not M.</td>
</tr>
<tr>
<td>Neither S nor M is P.</td>
<td>(a) S is not M.</td>
<td></td>
</tr>
<tr>
<td>(a) S is not M.</td>
<td>(b) S is not P.</td>
<td>(c) S is P.</td>
</tr>
</tbody>
</table>

But (1) concludes with a mere repetition, (2) and (3) with a contingent "may be," which, as Aristotle says, also "may not be," and therefore *nihil certe colligitur.* The same answer
applies to Schuppe's supposed syllogisms from two particular premises:

\[
\begin{array}{c|c}
(1) & (2) \\
\hline
\text{Some } M \text{ is } P. & \text{Some } M \text{ is } P. \\
\text{Some } S \text{ is } M. & \text{Some } S \text{ is } M. \\
\therefore \text{Some } S \text{ may be } P. & \therefore \text{Some } S \text{ may be } P.
\end{array}
\]

The only difference between these and the previous examples (2) and (3) is that, while those break the rule against two negative premises, these break that against undistributed middle. Equally fallacious are two other attempts of Schuppe to produce syllogisms from invalid moods:

\[
\begin{array}{c|c}
(1) & (2) \\
\hline
\text{All } S \text{ is } M. & \text{All } S \text{ is } M. \\
\text{All } M \text{ is } P. & \text{All } M \text{ is } P. \\
\therefore \text{Some } S \text{ may be } P. & \therefore \text{Some } S \text{ may be } P.
\end{array}
\]

In the first the fallacy is the indifferent contingency of the conclusion caused by the non-sequitur from a negative premise to an affirmative conclusion; while the second is either a mere repetition of the premises if the conclusion means "S is like P in being M," or, if it means "S is P," a non-sequitur on account of the undistributed middle. It must not be thought that this trifling with logical rules has no effect. The last supposed syllogism, namely, that having two affirmative premises and entailing an undistributed middle in the second figure, is accepted by Wundt under the title "Inference by Comparison" (Vergleichungsschluss), and is supposed by him to be useful for abstraction and subsidiary to induction, and by Bosanquet to be useful for analogy. Wundt, for example, proposes the following premises:

Gold is a shining, fusible, ductile, simple body.

Metals are shining, fusible, ductile, simple bodies.

But to say from these premises, "Gold and metal are similar in what is signified by the middle term," is a mere repetition of the premises; to say, further, that "Gold may be a metal" is a non-sequitur, because, the middle being undistributed, the logical conclusion is the contingent "Gold may or may not be a metal," which leaves the question quite open, and therefore there is no syllogism. Wundt, who is again followed by Bosanquet, also supposes another syllogism in the third figure, under the title of "Inference by Connexion" (Verbindungschluss), to be useful for induction. He proposes, for example, the following premises:

Gold, silver, copper, lead, are fusible.

Gold, silver, copper, lead, are metals.

Here there is no syllogistic fallacy in the premises; but the question is what syllogistic conclusion can be drawn, and there is only one which follows without an illicit process of the minor, namely, "Some metals are fusible." The moment we stir a step further with Wundt in the direction of a more general conclusion (ein allgemeiner Satz), we cannot infer from the premises the conclusion desired by Wundt, "Metals and fusible are connected"; nor can we infer "All metals are fusible," nor "Metals are fusible," nor "Metals may be fusible," nor "All metals may be fusible," nor any assertory conclusion, determinate or indeterminate, but the indifferent contingent, "All metals may or may not be fusible," which leaves the question undecided, so that there is no syllogism. We do not mean that in Wundt's supposed "inferences of relation by comparison and connexion" the premises are of no further use; but those of the first kind are of no syllogistic use in the second figure, and those of the second kind of no syllogistic use beyond particular conclusions in the third figure. What they really are in the inferences proposed by Wundt is not premises for syllogism, but data for induction parading as syllogism. We must pass the same sentence on Lotze's attempt to extend the second figure of the syllogism for inductive purposes, thus:

\[
\begin{array}{c|c}
\hline
\text{S is M.} & \text{S is M.} \\
\text{Q is } & \text{Q is } \\
\text{R is M.} & \text{R is M.} \\
\therefore \text{Every } S, \text{ which is common to } S, Q, R, \text{ is M.} & \therefore \text{Every } S, \text{ which is common to } S, Q, R, \text{ is M.}
\end{array}
\]

We could not have a more flagrant abuse of the rule Ne esto plus minusque in conclusione quam in praemissis. As we see from Lotze's own defence, the conclusion cannot be drawn without another premise or premises to the effect that "S, Q, R, are S, and S is the one real subject of M." But how is all this to be got into the second figure? Again, Wundt and B. Erdmann propose new moods of syllogism with convertible premises, containing definitions and equations. Wundt's Logic has the following forms:

\[
\begin{array}{c|c}
(1) & (2) \\
\hline
\text{1st Fig.} & \text{2nd Fig.} \\
\text{Only } M \text{ is } P. & \text{Only } M \text{ is } P. \\
\text{No } S \text{ is } M. & \text{No } S \text{ is } M. \\
\therefore \text{No } P \text{ is } S. & \therefore \text{No } P \text{ is } S. \\
\end{array}
\]

Now, there is no doubt that, especially in mathematical equations, universal conclusions are obtainable from convertible premises expressed in these ways. But the question is how the premises must be thought, and they must be thought in the converse way to produce a logical conclusion. Thus, we must think in (1) "All P is M," to avoid illicit process of the major, in (2) "All S is M" to avoid undistributed middle, in (3) "All x is y" to avoid illicit process of the minor. Indeed, it is the very essence of a convertible judgment to think it in both orders, and especially to think it in the order necessary to an inference from it. Accordingly, however expressed, the syllogisms quoted above are, as thought, ordinary syllogisms, (1) being Camestres in the second figure, (2) and (3) Barbara in the first figure. Aristotle, indeed, was as well aware as German logicians of the force of convertible premises; but he was also aware that they require no special syllogisms, and made it a point that, in a syllogism from a definition, the definition is the middle, and the definiens the major in a convertible major premise of Barbara in the first figure, e.g.:

The interposition of an opaque body is (essentially) deprivation of light.

The moon suffers the interposition of the opaque earth.

The moon suffers deprivation of light.

It is the same with all the recent attempts to extend the syllogism beyond its rules, which are not liable to exceptions, because they follow from the nature of syllogistic inference, from the nature of a universal to particular. To give the name of syllogism to inferences which infringe the general rules against undistributed middle, illicit process, two negative premises, non-sequitur from negative to affirmative, and the introduction of what is not in the premises into the conclusion, and which consequently infringe the special rules against affirmative conclusions in the second figure, and against universal conclusions in the third figure, is to open the door to fallacy, and at best to confuse the syllogism with other kinds of inference, without enabling us to understand any one kind.

3. Analytic and Synthetic Deduction.—Alexander the Commentator defined synthesis as a progress from principles to consequences, analysis as a regress from consequences to principles; and Latin logicians preserved the same distinction between the progressus a principiis ad principia, and the regressus a principiis ad principia. No distinction is more vital in the logic of inference in general and of scientific inference in particular; and yet none has been so little understood, because, though analysis is the more usual order of discovery, synthesis is that of instruction, and therefore, by becoming more familiar, tends to replace and obscure the previous analysis. The distinction, however, did not escape Aristotle, who saw that a progressive syllogism can be reversed thus:

1. Progression.

\[
\begin{array}{c|c|c}
\hline
\text{All } M \text{ is } P. & \therefore \text{All } P \text{ is } M. \\
\text{All } S \text{ is } M. & \therefore \text{All } S \text{ is } P. \\
\text{All } M \text{ is } S. & \therefore \text{All } M \text{ is } P. \\
\end{array}
\]

2. Regression.

\[
\begin{array}{c|c|c}
\hline
\text{All } M \text{ is } P. & \therefore \text{All } P \text{ is } M. \\
\text{All } S \text{ is } P. & \therefore \text{All } S \text{ is } M. \\
\text{All } M \text{ is } S. & \therefore \text{All } M \text{ is } P. \\
\end{array}
\]

Proceeding from one order to the other, by converting one of the premises, and substituting the conclusion as premise for the other premise, so as to deduce the latter as conclusion, is what he calls circular inference; and he remarked that the process is fallacious unless it contains propositions which are convertible, as in mathematical equations. Further, he perceived that the difference between the progressive and regressive orders extends from mathematics to physics, and that there are two kinds of syllogism: one progressing a priori from real ground
to consequent fact (ὅ τοι δεύτερον), and the other
regressing a posteriori from consequent fact to real ground
(ὅ τοι πρώτον). For example, he says, the sphericity of
the moon is the real ground of the fact of its light; waxing;
but we can deduce either from the other, as follows:—

1. **Progression.**
   What is spherical waxes.
   The moon is spherical.
   . . . The moon waxes.
2. **Regression.**
   What waxes is spherical.
   The moon waxes.
   . . . The moon is spherical.

These two kinds of syllogism are synthesis and analysis in the
ancient sense. Deduction is analysis when it is regressive from
consequence to real ground, as when we start from the proposition
that the angles of a triangle are equal to two right angles and
deduce analytically that therefore (1) they are equal to equal
angles made by a straight line standing on another straight
line, and (2) such equal angles are two right angles. Deduction
is synthesis when it is regressive from real ground to consequence,
as when we start from these two results of analysis as principles
and deduce synthetically the proposition that therefore the
angles of a triangle are equal to two right angles, in the order
familiar to the student of Euclid. But the full value of the
ancient theory of these processes cannot be appreciated until
we recognize that, as Aristotle planned them, Newton used them.

Much of the **Principia** consists of synthetical deductions from
definitions and axioms. But the discovery of the centripetal
force is one of the great triumphs of Newton's discovery. He
considers Kepler's law of centripetal force, and discovers, from
the facts of the motion discovered by Kepler, the centripetal
force to be the ground of both the angular and the linear
force. This force is called the centripetal force to the sun, and
is so stated by Newton in the first regressive order of
Aristotle—P, M, S, P, S, M. Newton did indeed first show
synthetically what kind of motions by mechanical laws have
their ground in a centripetal force varying inversely as the square
of the distance (all P is M); but his next step was, not to
deduce synthetically the planetary motions, but to make a
new start from the planetary motions as facts established by
Kepler's laws and as examples of the kind of motions in question
(all S is P); and, then, by combining these two premises, one
mechanical and the other astronomical, he analytically deduced
that these facts of planetary motion have their ground in a
centripetal force varying inversely as the squares of the distances
of the planets from the sun (all S is M). (See **Principia I** prop.
2; 4 coroll. 6; III. Phaenomena, 4-5; prop. 2.) What Newton
did, in short, was to prove by analysis that the planets, revolving
by Kepler's astronomical laws round the sun, have motions
such as by mechanical laws are consequences of a centripetal
force to the sun. This done, as the major is convertible, the
analytic order—P, M, S, P, S, M—was easily inverted into the
synthetic order—M, P, S, M, P, S; and in this regressive order
the deducing of the real ground as now taught begins with the centripetal
force of the sun as real ground, and deduces the facts of planetary
motion as consequences. Thereupon the Newtonian analysis
which preceded this synthesis, became forgotten; until at last
Mill in his **Logic**, neglecting the **Principia**, had the temerity
to distort Newton's discovery, which was really a pure example
of analytic deduction, into a mere hypothetical deduction; as
if the author of the saying "**Hypotheses non fingo**" started
from the hypothesis of a centripetal force to the sun, and thence
deductively explained the facts of planetary motion, which
reciprocally verified the hypothesis. This gross misrepresentation
has made hypothesis a kind of logical fashion. Worse still,
Jevons proceeded to confuse analytic deduction from consequence
to ground with hypothetical deduction from ground to
consequence under the common term "inverse deduction." Wundt
attempts, but in vain, to make a compromise between the old
and the new. He re-defines analysis in the very opposite way
to the ancients; whereas they defined it as a regressive process
from consequence to ground, according to Wundt it is a pro-
gressive process of taking for granted a proposition and deducing
a consequence, which being true verifies the proposition. He
then divides it into two species: one categorical, the other
hypothetical. By the categorical he means the ancient analysis
from a given proposition to more general propositions. By the
hypothetical he means the new-fangled analysis from a given
proposition to more particular propositions, i.e. from a hypothesis
to consequent facts. But his account of the first is imperfect,
because in ancient analysis the more general propositions,
which are deduced, are not mere consequences, but the real
grounds of the given proposition; whereas his definition of the
second reduces the nature of analysis to the utmost confusion,
because hypothetical deduction is regressive from hypothesis
to consequent facts whereas analysis is regressive from
consequent facts to real ground. There is indeed a sense
in which all inference is from ground to consequence, because
it is from logical ground (principium cognoscendi) to logical
consequence. But in the sense in which deductive analysis
is opposed to deductive synthesis, analysis is deduction from
real consequence as logical ground (principium as principium)
cognoscendi) to real ground (principium essendi), e.g. from
the consequential facts of planetary motion to their real ground,
i.e., centripetal force to the sun. Hence Sigwart is undoubtedly
right in distinguishing analysis from hypothetical deduction,
for which he proposes the name "reduction." We have only
further to add that many scientific discoveries about sound, heat,
light, colour, and so forth, which is the fashion to represent
as hypotheses to explain facts, are really analytical deductions
from the facts to their real grounds in accordance with mechanical
laws. Recent logic does scant justice to scientific analysis.

4. **Induction.**—As induction is the process from particulars
to universals, it might have been thought that it would always
have been opposed to syllogism, in which one of the rules
is against the particular premise to obtain universal conclusions.
Yet such is the passion for one type that from Aristotle's time
till now constant attempts have been made to reduce induction
to syllogism. Aristotle himself invented an inductive syllogism
in which the major (P) is to be referred to the middle (M)
by means of the minor (S), thus:

A, B, C magnets (S) attract iron (P).
A, B, C magnets (S) are all magnets whatever (M).
. . . All magnets whatever (M) attract iron (P).

As the second premise is supposed to be convertible, he reduced
the inductive to a deductive syllogism as follows:

Every S is P.
Every S is P.
. . . Every S is P.

In the reduced form the inductive syllogism was described
by Aldrich as "**Syllogismus in Barbara cujus minor (i.e. every
M is S) relictur**." Whately, on the other hand, proposed an
inductive syllogism with the major suppressed, that is, instead
of the minor premise above, he supposed a major premise,
which he called the major premise to universal conclusions.
Mill supposed a still more general premise, an assumption
of the uniformity of nature. Since Mill's time, however, the
logic of induction tends to revert towards syllogisms more like
that of Aristotle. Jevons supposed induction to be inverse
deduction, distinguished from direct deduction as analysis
from synthesis, e.g. as division from multiplication; but he really
meant that it is a deduction from a hypothesis of the law of a
cause to particular effects which, being true, verify the hypothesis.
Sigwart declares himself in agreement with Jevons; except that,
being aware of the difference between hypothetical deduction
and mathematical analysis, and seeing that, whereas analysis (e.g. in
division) leads to certain conclusions, hypothetical deduction
is not certain of the hypothesis, he arrives at the more definite
view that induction is not analysis proper but hypothetical
deduction, or "reduction," as he proposes to call it. Reduction
he defines as "the framing of possible premises for given
propositions, or the construction of a syllogism when the conclusion
and one premise is given." On this view induction becomes
a reduction in the form: all M is P (hypothesis), S is M (given),
. . . S is P (given). The views of Jevons and Sigwart are in
agreement in two main points. According to both, induction,
instead of inferring from A, B, C magnets the conclusion "Therefore
all magnets attract iron," infers from the hypothesis,
"Let every magnet attract iron," to A, B, C magnets, whose
given attraction verifies the hypothesis. According to both,
again, the hypothesis of a law with which the process starts contains more than is present in the particular data: according to Jevons, his hypothesis of a law of a cause from which induction deduces particular effects; and according to Sigwart, it is a hypothesis of the ground from which the particular data necessarily follow according to universal laws. Lastly, Wundt's view is an interesting piece of eclecticism, for he supposes that induction begins in the form of Aristotle's inductive syllogism, S-P, S-M, M-P, and becomes an inductive method in the form of Jevons' inverse deduction, or hypothetical deduction, or analysis, M-P, S-M, S-P. In detail, he supposes that, while an "inference by comparison," which he erroneously calls an affirmative syllogism in the second figure, is preliminary to induction, a second "inference by connexion," which he erroneously calls a syllogism in the third figure with an indeterminate conclusion, is the inductive syllogism itself. This is like Aristotle's inductive syllogism in the arrangement of terms; but, while on the one hand Aristotle did not, like Wundt, confound it with the third figure, on the other hand Wundt does not, like Aristotle, suppose it to be practicable to get inductive data so wide as the convertible premise, "All S is M, and all M is S," which would at once establish the conclusion, "All M is P." Wundt's point is that the conclusion of the inductive syllogism is neither so much as all, nor so little as some, but rather the indeterminate "M and P are connected." The question therefore arises, how we are to discover "All M is P," and this question Wundt answers by adding an inductive method, which involves inverting the inductive syllogism in the style of Aristotle into a deduc- syllogism from a hypothesis in the style of Jevons, thus:

\[
\begin{align*}
(1) & \quad S \text{ is } P. \\
(2) & \quad \text{Every } M \text{ is } P. \\
& \quad \text{M and } P \text{ are connected.}
\end{align*}
\]

He agrees with Jevons in calling this second syllogism analytical deduction, and with Jevons and Sigwart in calling it hypothetical deduction. It is, in fact, a common point of Jevons, Sigwart and Wundt that the universal is not really a conclusion inferred from given particulars, but a hypothetical major premise from which given particulars are inferred, and that this major contains presuppositions of causation not contained in the particulars.

It is noticeable that Wundt quotes Newton's discovery of the centripetal force of the planets to the sun as an instance of this supposed hypothetical, analytic, inductive method; as if Newton's analysis were a hypothesis of the centripetal force to the sun, a deduction of the given facts of planetary motion, and a verification of the hypothesis by the given facts, and as if such a process of hypothetical deduction could be identical with either analysis or induction. The abuse of this instance of Newtonian analysis betrays the main origin of the current confusion of induction with deduction. One confusion has led to another. Mill confused Newton's analytical deduction with hypothetical deduction; and thereupon Jevons confused induction with both. The result is that both Sigwart and Wundt transform the inductive process of adding particular examples to induce a universal law into a deductive process of presupposing a universal law as a ground to deduce particular consequences. But we can easily extricate ourselves from these confusions by comparing induction with different kinds of deduction. The point about induction is that it starts from experience, and that, though in most classes we can experience only some particulars individually, yet we infer all. Hence induction cannot be reduced to Aristotle's inductive syllogism, because experience cannot give the convertible premise, "Every S is M, and every M is S"; that "All A, B, C are magnets" is, but that "All magnets are A, B, C" is not, a fact of experience. For the same reason induction cannot be reduced to analytical deduction of the second kind in the form, S-P, M-S, ... M-P; because, though both end in a universal conclusion, the limits of experience prevent induction from such inference as:

Every experienced magnet attracts iron.

Every magnet whatever is every experienced magnet.

...Every magnet whatever attracts iron.

Still less can induction be reduced to analytical deduction of the first kind in the form—P-M, S-P, ... S-M, of which Newton has left so conspicuous an example in his Principia. As the example shows, that analytic process starts from the scientific knowledge of a universal and convertible law (every M is P, and every P is M), e.g. a mechanical law of all centripetal force, and ends in a particular application, e.g. this centripetal force of planets to the sun. But induction cannot start from a known law. Hence it is that Jevons, followed by Sigwart and Wundt, reduces it to deduction from a hypothesis in the form "Let every M be P, S is M, ... S is P." There is a superficial resemblance between induction and this hypothetical deduction. Both in a way use given particulars as evidence. But in induction the given particulars are the evidence by which we discover the universal, e.g. particular magnets attracting iron are the origin of an inference that all do; in hypothetical deduction, the universal is the evidence by which we explain the given particulars, as when we suppose undulating aether to explain the effects of heat and light. In the former process, the given particulars are the data from which we infer the universal; in the latter, they are only the consequent facts by which we verify it. Or rather, there are two uses of induction: inductive discovery before deduction, and inductive verification after deduction. But neither use of induction is the same as the deduction itself: the former precedes, the latter follows it. Lastly, the theory of Mill, though frequently adopted, e.g. by B. Erdmann, need not detain us long. Most inductions are made without any assumption of the uniformity of nature; for, whether it is itself induced, or a priori or postulated, this like every assumption is a judgment, and most men are incapable of judgment on so universal a scale, when they are quite capable of induction. The fact is that the uniformity of nature stands to induction as the axioms of syllogism do to syllogism; they are not premises, but conditions of inference, which ordinary men use spontaneously, as was pointed out in Physical Realism, and afterwards in Venn's Empirical Logic. The axiom of contradiction is not a major premise of a judgment: the dictum de omni et nullo is not a major premise of a syllogism: the principle of uniformity is not a major premise of an induction. Induction, in fact, is no species of deduction; they are opposite processes, as Aristotle regarded them except in the one passage where he was reducing the former to the latter, and as Bacon always regarded them. But it is easy to confuse them by mistaking examples of deduction for inductions. Thus Whewell mistook Kepler's inference that Mars moves in an ellipse for an induction, though it required the combination of Tycho's and Kepler's observations, as a minor, with the laws of conic sections discovered by the Greeks, as a major, premise. Jevons, in his Principles of Science, constantly makes the same sort of mistake. For example, the inference from the similarity between solar spectra and the spectra of various gases on the earth to the existence of similar gases in the sun, is called by him an induction; but it really is an analytical deduction from effect to cause, thus:

**Such and such spectra are effects of various gases.**

**Solar spectra are such spectra.**

**Solar spectra are effects of those gases.**

In the same way, to infer a machine from hearing the regular tick of a clock, to infer a player from finding a pack of cards arranged in suits, to infer a human origin of stone implements, and all such inferences from patent effects to latent causes, though they appear to Jevons to be typical inductions, are really deductions which, besides the minor premise stating the particular effects, require a major premise discovered by a previous induction and stating the general kind of effects of a general cause. B. Erdmann, again, has invented an induction from particular predicates to a totality of predicates which he calls "ergänzende Induction," giving as an example, "This body has the colour, extensibility and specific gravity of magnesium; therefore it is magnesium." But this inference contains the tacit major, "What has a given colour, &c., is magnesium," and is a syllogism of recognition. A deduction is often like an induction, in inferring from particulars; the difference is that
deduction combines a law in the major with the particulars in the minor premise, and infers syllogistically that the particulars of the minor have the predicate of the major premise, whereas induction uses the particulars simply as instances to generalize a law. An infallible sign of an induction is that the subject and predicate of the universal conclusion are merely those of the particular instances generalized; e.g. “These magnets attract iron, . . . all do.”

This brings us to another source of error. As we have seen, Jevons, Sigwart and Wundt all think that induction contains a belief in causation, in a cause, or ground, which is not present in the particular facts of experience, but is contributed by a hypothesis added as a major premise to the particulars in order to explain them by the cause or ground. Not so; when an induction is causal, the particular instances are already, beliefs in particular causes, e.g. “My right hand is exerting pressure reciprocally with my left,” “A, B, C magnets attract iron;” and the problem is to generalize these causes, not to introduce them. Induction is not introduction. It would make no difference to the form of induction, if, as Kant thought, the notion of causality is a priori; for even Kant thought that it is already contained in experience. But whether Kant be right or wrong, Wundt and his school are decidedly wrong in supposing “supplementary notions which are not contained in experience itself, but are gained by a process of logical treatment of this experience”; as if our behalf in causality could be neither a posteriori nor a priori, but beyond experience wake up in a hypothetical major premise of induction. Really, we first experience that particular causes have particular effects; then induce that causes similar to those have effects similar to these; finally, deduce that when a particular cause of the kind occurs it has a particular effect of the kind by synthetic deduction, and that when a particular effect of the kind occurs it has a particular cause of the kind by analytic deduction with a convertible major premise. Then Newton from planetary motions, like terrestrial motions, analytically deduced a centripetal force to the sun like centripetal forces to the earth. Moreover, causal induction is itself both synthetic and analytic: according as experiment combines elements into a compound, or resolves a compound into elements, it is the origin of a synthetic or an analytic generalization. Not, however, that all induction is causal; but where it is not, there is still less reason for making it a deduction from hypothesis. When from the fact that the many crows in our experience are black, we induce the probability that all crows whatever are black, the belief in the particulars is quite independent of this universal. How then can this universal be called, as Sigwart, for example, calls it, the ground from which these particulars follow? I do not believe that the crows I have seen are black because all crows are black, but vice versa. Sigwart simply inverts the order of our knowledge. In all induction, as Aristotle said, the particulars are the evidence, or ground of our knowledge (principium cognoscenti), of the universal. In causal induction, the particulars further contain the cause, or ground of the being (principium essendi), of the effect, as well as the ground of our inducing the law. In all induction the universal is the conclusion, in none a major premise, and in none the ground of either the being or the knowing of the particulars. Induction is generalization. It is not syllogism in the form of Aristotle’s or Wundt’s inductive syllogism, because, though starting only from some particulars, it concludes with a universal; it is not syllogism in the form called inverse deduction by Jevons, reduction by Sigwart, inductive method by Wundt; because it often uses particular facts of causation to infer universal laws of causation; it is not syllogism in the form of Mill’s syllogism from a belief in uniformity of nature, because few men have believed in uniformity, but all have induced from particulars to universals. Bacon alone was right in altogether opposing induction to syllogism, and in finding inductive rules for the inductive process from particular instances of presence, absence in similar circumstances, and comparison.

5. Inference in General. — There are, as we have seen (ad init.), three types—syllogism, induction and analogy. Different as they are, the three kinds have something in common: first, they are all processes from similar to similar; secondly, they all consist in combining two judgments so as to cause a third, whether expressed in so many propositions or not; thirdly, as a judgment is a belief in being, they all proceed from premises which are beliefs in being to a conclusion which is a belief in being. Nevertheless, simple as this account appears, it is opposed in every point to recent logic. In the first place, the point of Bradley’s logic is that “similarity is not a principle which works. What operates is identity, and that identity is a universal.” This view makes inference easy: induction is all over before it begins; for, according to Bradley, “every one of the instances is already a universal proposition; and it is not a particular fact or phenomenon at all,” so that the moment you observe that this magnet attracts iron, you ipso facto know that every magnet does so, and all that remains for deduction is to identify a second magnet as the same with the first, and conclude that it attracts iron. In dealing with Bradley’s works we feel inclined to repeat what Aristotle says of the discourses of Socrates: they all exhibit excellence, cleverness, novelty and inquiry, but their truth is a difficult matter; and the Socratic paradox that virtue is knowledge is not more difficult than the Bradleian paradox that as two different things are the same, inference is identification. The basis of Bradley’s logic is the fallacious dialectic of Hegel’s metaphysics, founded on the supposition that two things, which are different, but have something in common, are the same. For example, according to Hegel, being and not-being are both indeterminate and therefore the same. “If,” says Bradley, “A and B, for instance, both have lungs or gills, they are so far the same.” The answer to Hegel is that being and not-being are at most similarly indeterminate, and to Bradley that each animal has its own different lungs, whereby they are only similar. If they were the same, then in descending, two things, one of which has healthy and the other diseased lungs, would be the same; and in descending two things, one of which has lungs and the other has not, but both of which have life, e.g. plants and animals, would be so far the same. There would be no limit to identity either downwards or upwards; so that a man would be the same as a man-of-war, and all things would be the same thing, and not different parts of one universe. But a thing which has healthy lungs and a thing which has diseased lungs are only similar individuals numerically different. Each individual thing is the same only with itself, although related to other things; and each individual of a class has its own individual, though similar, attributes. The consequence of this true metaphysics to logic is twofold: on the one hand, one singular or particular judgment, e.g. “this magnet attracts iron,” is not another, e.g. “that magnet attracts iron,” and neither is universal; on the other hand, a universal judgment, e.g. “every magnet attracts iron,” means, distributively, that each individual magnet exerts individual attraction, though it is similar to other magnets exerting similar attractions. A universal is not “one identical point,” but one distributive whole. Hence in a syllogism, a middle term, e.g. magnets, is “absolutely the same,” not in the sense of “one identical point,” making each individual the same as any other, as Bradley supposes, but only in the sense of one whole class, or total of many similar individuals, e.g. magnets, each of which is separately though similarly a magnet, not magnet in general. Hence also induction is a real process, because, when we know that this individual magnet attracts iron, we are very far from knowing that all alike do so similarly; and the question of inductive logic, how we get from some similarities to all similarities, remains, as before, a difficulty, but not to be solved by the fallacy that inference is identification.

Secondly, a subordinate point in Bradley’s logic is that there are inferences which are not syllogisms; and this is true. But when he goes on to propose, as a complete independent inference, “A is to the right of B, B is to the right of C therefore A is to the right of C,” he confuses two different operations. When A, B and C are objects of sense, their relative positions are matters, not of inference, but of observation; when they are not, there is an inference, but a syllogistic inference with a major premise
induced from previous observations, "whenever of three things the first is to the right of the second, and the second to the right of the third, the first is to the right of the third." To reply that this universal judgment is not expressed, or that its expression is ambiguous, is no answer, because, whether expressed or not, it is required for the thought. As Aristotle puts it, the syllogism is directed "not to the outer, but to the inner discourse," or as we should say, not to the expression but to the thought, not to the proposition but to the judgment, and to the inference not verbally but mentally. Bradley seems to suppose that the major premise of a syllogism must be explicit, or else is nothing at all. But it is often thought without being expressed, and to judge the syllogism by its mere explicit expression is to commit an ignoratio lenticul, for it has been known all along that we express less than we think, and the very purpose of syllogistic logic is to analyze the whole thought necessary to the conclusion. In this syllogistic analysis two points must always be considered: one, that we usually use premises in thought which we do not express; and the other, that we sometimes use them unconsciously, and therefore infer and reason unconsciously, in the manner excellently described by Zeller in his Vorläge, iii. pp. 240-255. Inference is a deeper thinking process from judgments to judgment, which only occasionally and partially emerges in the linguistic process from propositions to proposition. We may now then reassert two points about inference against Bradley's logic: the first, that it is a process from similar to similar, and not a process of identification, because two different things are not at all the same thing; the second, that it is the mental process from judgments to judgment rather than the linguistic process from propositions to proposition, because, besides the judgments expressed in propositions, it requires judgments which are not always expressed, and are sometimes even unconscious.

Our third point is that, as a process of judgments, inference is a process of concluding from two beliefs in being to another belief in being, and not an ideal construction, because a judgment does not always require ideas, but is always a belief about things, existing or not. This point is challenged by all the many ideal theories of judgment already quoted. If, for example, judgment were an analysis of an aggregate idea as Wundt supposes, it would certainly be true with him to conclude that "as judgment is an immediate, inference is a mediate, reference of the members of an aggregate of ideas to one another." But really a judgment is a belief that something, existing, or thinkable, or nameable or what not, is (or is not) determined; and inference is a process from and to such beliefs in being. Hence the fallacy of those who, like Bosanquet, or like Paulsen in his Einleitung in die Philosophie, represent the realistic theory of inference as if it meant that knowledge starts from ideas and then infers that ideas are copies of things, and who then object, rightly enough, that we could not in that case compare the copy with the original, but only be able to infer from idea to idea. But there is another realism which holds that inference is a process neither from ideas to ideas, nor from ideas to things, but from beliefs to beliefs, from judgments about things in the premises to judgments about similar things in the conclusion. Logical inference never goes through the impossible process of premising nothing but ideas, and concluding that ideas are copies of things. Moreover, as we have shown, our primary judgments of sense are beliefs founded on sensations without requiring ideas, and are beliefs, not merely that something is determined, but that it is determined as existing; and, accordingly, our primary inferences from these sensory judgments of existence are inferences that other things beyond sense are similarly determined as existing. First press your lips together and then press a pen between them: you will not be conscious of perceiving any idea; you will be conscious first of perceiving one existing lip exerting pressure reciprocally with the other existing lip; then, on putting the pen between your lips, of perceiving each lip similarly exerting pressure, but not with the other; and consequently of inferring that each existing lip is exerting pressure reciprocally with another existing body, the pen. Inference then, though it is accompanied by ideas, is not an ideal construction, nor a process from idea to idea, nor a process from idea to thing, but a process from direct to indirect beliefs in things, and originally in existing things. Logic cannot, it is true, decide what these things are, nor what the senses know about them, without appealing to metaphysics and psychology. But, as the science of inference, it can make sure that inference, on the one hand, starts from sensory judgments about sensible things and logically proceeds to inferential judgments about similar things beyond sense, and, on the other hand, cannot logically go beyond the similar. These are the limits within which logical inference works, because its nature essentially consists in proceeding from two judgments to another about similar things, existing or not.

6. Truth.—Finally, though sensory judgment is always true of its sensible object, inferential judgments are not always true, but are true so far as they are logically inferred, however indirectly, from sense; and knowledge consists of sense, memory and syllogistic and logical inference from sense, which, we must remember, is not merely the outer sense of our five senses, but also the inner sense of ourselves as conscious thinking persons. We come then at last to the old question—What is truth? Truth proper, as Aristotle said in the Metaphysics, is in the mind: it is not being, but one's signification of being. Its requisites are that there are things to be known and powers of knowing things. It is an attribute of judgments and derivatively of propositions. That judgment is true which apprehends a thing as it is capable of being known to; and that proposition is true which so asserts the thing to be. Or, to combine truth in thought and in speech, the true is what signifies a thing as it is capable of being known. Secondly, the thing itself is ambiguously said to be true in the sense of being signified as it is. For example, as I am weary and am conscious of being weary, my judgment and proposition that I am weary are true because they signify what I am weary of; and my assumption that I am weary is ambiguous said to be true because it is so signified. But it will be said that Kant has proved that real truth, in the sense of the "agreement of knowledge with the object," is unattainable, because we could compare knowledge with the object only by knowing both. Sigwart, indeed, adopting Kant's argument, concludes that we must be satisfied with consistency among the thoughts which presuppose an existent; this, too, is the reason why he thinks that induction is reduction, on the theory that we can show the necessary consequence of the given particular, but that truth of fact is unattainable. But Kant's criticism and Sigwart's corollary only derive plausibility from a false definition of truth. Truth is not the agreement of knowledge with an object beyond itself, and therefore ex hypothesi unknowable, but the agreement of our judgments with the objects of our knowledge. A judgment is true whenever it is a belief that a thing is determined as it is known to be by sense, or by sense and by inference from sense, but indirectly the inference may be, and even when in the form of inference of non-existence it extends consequently from primary to secondary judgments. Thus the judgments "this sensible pressure exists," "that sensible pressure existed," "other similar pressures exist," "a conceivable centaur does not exist but is a figment," are all equally true, because they are in accordance with one or other of these kinds of knowledge. Consequently, as knowledge is attainable by sense, memory and inference, truth is also attainable, because, though we cannot test what we know by something else, we can test what we judge and assert by what we know. Not that all inference is knowledge, but it is sometimes. The aim of logic in general is to find the laws of all inference, which, so far as it obeys those laws, is always consistent, but is true or false according to its data as well as its consistency; and the aim of the special logic of knowledge is to find the laws of direct and indirect inferences from sense, because as sense produces sensory judgments which are always true of the sensible things actually perceived, inference from sense produces inferential judgments which, so far as they are consequent on sensory judgments, are always true of things similar to sensible things, by the very consistency of inference, or, as we say, by
parity of reasoning. We return then to the old view of Aristotle, that truth is believing in; that sense is true of its immediate objects, and reasoning from sense true of its most remote objects; and the whole science of reasoning with a true to true. Logica est aris ratiocinandi, ut discernatur verum a falso. All we aspire to add is that, in order to attain to real truth, we must proceed gradually from sense, memory and experience through analogical particular inference, to inductive and deductive universal inference or reasoning. Logic is the science of all inference, beginning from sense and ending in reason.

In conclusion, the logic of the last quarter of the 19th century may be said to be animated by a spirit of inquiry, marred by a love of paradox and a corresponding hatred of tradition. But we have found, on the whole, that logical tradition rises superior to logical innovation. There are two old logics which still remain indispensable, Aristotle's Organon and Bacon's Novum Organum. If, and only if, the study of deductive logic begins with Aristotle, and the study of inductive logic with Aristotle and Bacon, it will be profitable to add the works of the following recent German and English authors:

II. History

Logic cannot dispense with the light afforded by its history so long as counter-solutions of the same fundamental problems continue to hold the field. A critical review of some of the chief types of logical theory, with a view to determine development, needs no further justification.

Logic arose, at least for the Western world, in the golden age of Greek speculation which culminated in Plato and Aristotle. There is an Indian logic, it is true, but its priority is more than disputable. In any case no influence upon Greek thought can be shown. The movement which ends in the logic of Aristotle is demonstrably self-contained. When we have shaken ourselves free of the prejudice that all stars are first seen in the East, Oriental attempts at analysis of the structure of thought may be treated as negligible.

With Aristotle that Socratic tradition begins to dominate the evolution of logic. The technical perfection of the analysis which he offers is, granted the circle of presuppositions within which it works, so decisive, that what precedes, even Plato's logic, is not unnaturally regarded as merely preliminary and subsidiary to it. What follows is inevitably, whether directly or indirectly, by sympathy or by antagonism, affected by the Aristotelian tradition.

A. Greek Logic

i. Before Aristotle

Logic needs as its presuppositions that thought should distinguish itself from things and from sense, that the problem of validity should be seen to be raised in the field of thought itself, and that analysis of the structure of thought should be recognized as the one way of solution. Thought is somewhat late in coming to self-consciousness. Implied in every contrast of principle and fact, of rule and application, involved as we see after the event, most decisively when we react correctly upon a world incorrectly perceived, thought is yet not reflected on in the common experience. Its so-called natural logic is only the potentiality of logic. The same thing is true of the first stage of Greek philosophy. In seeking for a single material principle underlying the multiplicity of phenomena, the first nature-philosophers, Thales and the rest, did indeed raise the problem of the one and the many, the endeavor to answer which must at last lead to logic. But it is only from a point of view won by later speculation that it can be said that they sought to determine the predicates of the single subject-reality, or to establish the permanent subject of varied and varying predicates. The direction of their inquiry is persistently outward. They hope to explain the opposed appearance and reality wholly within the world of things, and irrespective of the thought that thinks things. Their universal is still a material one. The level of thought on which they move is still clearly prelogical. It is an advance on this which Heraclitus opposes to the eyes and ears which are bad witnesses "for such as understand not their language" a common something which we would do well to follow; or again when in the incomensurability of the diagonal and side of a square the Pythagoreans stumbled upon what was clearly neither thing nor image of sense, but yet was endowed with meaning, and henceforth were increasingly at home with symbol and formula. So far, however, it might well be that thought, contradistinguished from sense with its illusions, was itself infallible. A further step, then, was necessary, and it was taken at any rate by the Eleatics, when they opposed their thought to the thought of others, as the way of truth in contrast to the way of opinion. If Eleatic thought stands over against Pythagorean thought as what is valid or grounded against what is ungrounded or invalid, we are embarked upon dialectic, or the debate in which thought is translated into speech or writing. Critical thought must now be substantiated in this field and in this field alone. It was Zeno, the controversialist of the Eleatic school, who was regarded in after times as the "discoverer" of dialectic. Zeno's amazing skill in argumentation and his paradoxical conclusions, particular and general, inaugurate a new era. "The philosophical mind," says Walter Pater, "will perhaps never be quite in health, quite sane or natural again." The give and take of thought had by a swift transformation of values come by something more than its own. Zeno's paradoxes, notably, for example, the puzzle of Achilles and the Tortoise, are still capable of amusing the modern world. In his own age they found him imitators. And there follows the sophistic movement.

2 Heraclitus, Fragm. 107 (Diels, Fragmenta der Vorsokratiker) and 2, on which see Burnet, Early Greek Philosophy, p. 153 n. 50 (ed. 2).
3 e.g. Diog. Laërt. ix. 25. from the lost Sophists of Aristotle.
The sophists have other claims to consideration than their service to the development of logic. In the history of the origins of logic, the sophistic age is simply the age of the free play of thought, which neither by intent, leads to distinctiveness of thought, and yet not aware of the sense in all things cannot be. It is the age of discussion used as a universal solvent, before it has been brought to book by a deliberate unfolding of the principles which lie hidden behind the sophists as intellectual-such as a discipline of thought itself. The sophists furthered the transition from dialectic to logic in two ways. In the first place they made it possible. Incessant questioning leads to answers. Hair-splitting and selection of known and new forms of argument for their value. Paradoxical insistence on the accidents of speech-forms and thought-forms in the end to perception of the essentials. Second, they made it necessary. The spirit of debate run riot over the objects of inquiry, and order the appearance of the limiting dialectic. This higher dialectic is a logic. It is not accidental

that the first of the philosophers, sophists, Gorgias, on the one hand, is Eleatic in his affinities, and on the other raises in the character of thought and the logic of his intellectual nihilism issues which are as much logical and epistemological as ontological. The meaning of the copula and the relation of thought to the objects of which they are the thoughts as are much involved as the nature of being. It is equally accidental that the name of Protagoras is to be connected, in Plato's view at least, with the rival school of Herculaneans. The problems raised by the relativism of Protagoras are no less fundamentally problems of the nature of knowledge and of the structure of thought and the function of terms to deal with them, is in the broad sense of the word logical, the first distinctively logical treatise that has come down to us. Other sophists, of course, with more practical interests, or of humber axioms, of the untruth of language and of the possibility of speculation. As presented to us, for example, in Plato's surely not altogether hostile caricature in the Euthydemus, they mark the intellectual preparation for, and the moral need for, the advance of the next generation.

Among the pioneers of the sophistic age Socrates stands apart. He has no other instrument than the dialectic of his compere, and he is as far off as the rest from a criticism of the instrument, as much involved in the particularities, in the difference and difference. He construes the give and take of the argument-game with extreme rigour. The rhetorical element must be exercised. The set harangue of teacher to pupil, in which steps in argument are slurred and the single word answer of pupil is rendered as the intellectual, not by the logic as a whole.

The interlocutors must in truth render an account under the stimulus of organized heckling from their equals or superiors in debating ability. The argument is heuristic, though often enough the search ends in a self-confessed conclusion. Something can be found and something is found. Common names are fitted for use by the would-be users being first delivered from abstruse conceptions, and thereon enabled to bring to the birth living and organic notions.

And the thinking to Socrates involves two logical functions: general definition and inductive method. Rightly, if we add that he gives no theory of either, and that his practical use of the latter depends for its value on selection. It is rather in the very train of verbality of construction, and in the production of an absolute form and a rhetorical form, of which he does not undertake, and because of his consequent insistence on the elucidation of general concepts, which in common with some of his contemporaries, he may have thought of as endowed with a certain absolute status, and which include, as is often said, the Socratic schools as to the nature of prediction. These result in the formulation of a new dialectic or logic by Plato. Manifestly Socrates' use of certain forms of argument, like their abuse by the sophists, tended to evoke their logical analysis. The use and abuse, confronted one with the other, could not but evoke it.

The one in the many, the formula which lies at the base of the possibility of prediction, is involved in the Socratic doctrine of identity. The Socratic doctrine of identity is the point of view of bare identity, and the speechlessness of Cratylus from the Heraclean ground of absolute difference, are alike disowned. But the one in the many, the identity, in difference, is so far away from the common ground of contemporary philosophy and identity, that the difficulty as to the nature of the Socratic universal was of the essence to those, who deal with the identity-formula or the difference-formula of other teachers. The paradox of prediction, that it seems to deny identity, or to deny difference, becomes a protasis in the argument.

Knowledge of the sphere of essentialism, of the Socratic hypothesis, is a reading of the sphere of the Socratic hypothesis, a reading of the Socratic hypothesis, in which the identity of the Socratic hypothesis is an absolute form and a rhetorical form, of which he does not undertake, and because of his consequent insistence on the elucidation of general concepts, which in common with some of his contemporaries, he may have thought of as endowed with a certain absolute status, and which include, as is often said, the Socratic schools as to the nature of prediction. These result in the formulation of a new dialectic or logic by Plato. Manifestly Socrates' use of certain forms of argument, like their abuse by the sophists, tended to evoke their logical analysis. The use and abuse, confronted one with the other, could not but evoke it.

concepts of natural groups objectively regarded, to categories, to aesthetic and ethical ideals, to the concrete aims of the craftsman as well as to scientific laws—that have obscured his doctrine, viz. that wherever there is law, there is an idea.

(b) The paradox of the one in the many is none, if the idea may be regarded as supplying a principle of nexus or organization to an indefinite multiplicity of particulars. But if

The one in the many. Anti-sthenes is to be answered, a further step must be taken. The principle of difference must be carried into the field of the ideas. Not only sense is a principle of difference. The ideas are many. The multiplicity in unity must be established within thought itself. Otherwise the objection stands: man is man and good is good, but to say that man is good is clearly to say the thing that is not. Plato replies with the doctrine of the interpenetration of ideas, obviously not of all with all, but of some with some, the formula of identity in difference within itself. Nor can the opponent fairly refuse to admit it, if he affirms the participation of the identical with being, and denies the participation of difference with being, or affirms it with not-being. The Sophistes shows among other things that an identify philosophy is born into a dualism of thought and expression, when it applies the predicate of unity to the real, just as the absolute pluralism on the other hand collapses into unity if it affirms or admits any form of relation whatsoever. Identity and difference are all-pervasive categories, and the speech-form and the corresponding thought-form involve both. For proposition and judgment involve subject and predicate and exhibit what a modern writer calls "identity of reference with diversity of characterization." Plato proceeds to explain by his principle of difference both privative and negative predicates, and also the possibility of false predication. It is obvious that without the principle of difference error is inexplicable. Even Plato, however, perhaps scarcely shows that with it, and nothing else but it, error is explained.

(c) Plato's Division, or the articulation of a relatively indefinite and generic concept into species and sub-species with resultant determinate judgments, presumes of course the doctrine of the interpenetration of ideas laid down in the Sophistes as the basis of predication, but its use precedes the positive development of that formula, though not, save very vaguely, the exhibition of it, negatively, in the animonies of the one and the many in the Parmenides. It is its use, however, not the theory of it, that precedes. The latter is expounded in the Polite
cus (260 sqq.) and Philaeus (160 sqq.). The ideal is progressively to determine a universe of discourse till true infinitae species are reached, when no further distinction in the determinate many is possible, though there is still the numerical difference of the indefinite plurality of particulars. The process is to take as far as possible the form of a continuous disjunction of contraries. We must bisect as far as may be, but the division is after all to be into limbs, not parts. The later examples of the Politicus show that the permission of three or more coordinate species is not nugatory, and that the precept of dichotomy is merely in order to secure as little of a solutus as possible; to avoid e.g. the division of the animal world in men and brutes. It is the middle range of the utra of Philaeus 170 that appeals to Bacon, not only this but their mediating quality that appeals to Aristotle. The medius axiomatic of the one and the middle term of the other lie in the phrase. Plato's division is nevertheless neither syllogism nor exclusiva. It is not syllogism because it is based on the disjunctive, not on the hypothetical relation, and so extends horizontally where syllogism strikes vertically downward. Again it is not syllogism because it is necessarily and finally dialectical. It brings in the choice of an interlocutor at each stage, and so depends on a concession for what it should prove. Nor is it Bacon's method of exclusions, which escapes the imputation of being dialectical, if not that of being unduly cumbrous, in virtue of the cogency of the negative instance. The Platonic division was, however, offered as the scientific method of the school. A fragment of the comic poet

Epicrates gives a picture of it at work. And the movement of disjunction as truly has a place in the scientific specification of a concept in all its differences as the linking of lower to higher in syllogism. The two are complementary, and the reinstatement of the disjunctive judgment to the more honourable role in inference has been made by so notable a modern logician as Lotze.

(d) The correlative process of Combinations is less elaborately sketched, but in a luminous passage in the Politicus (§ 278), in explaining by means of an example the nature and use of examples, Plato represents it as the bringing of one and the same element seen in diverse settings to conscious realization, with the result that it is viewed as a single truth of which the terms compared are now accepted as the differences. The learner is to be led forward to the unknown by being made to work back to more familiar groupings of the alphabet of nature which he is coming to recognize with some certainty. To lead on, διάφως, is to refer back, διάφως, to what has been correctly divined of the same elements in clearer cases. Introduction to unfamiliar collations follows upon this, and, only later, is it possible to gather scattered examples into a respectus as instances of one idea or law. This is not only of importance in the history of the terminology of logic, but supplies a philosophy of induction.

(e) The correlate of Plato's illustration and explanation of predication and dialectical inference lies not only the question of their metaphysical grounding in the interconnexion of ideas, but that of their epistemological presuppositions. Mental syntheses. This is dealt with in the Theaetetus (184b sqq.). The manifold affections of sense are not simply aggregated in the individual, like the heroes in the Trojan horse. There must be convergence in a unitary principle, soul or consciousness, which is that which really functions in perception, the senses and their organs being merely its instruments. It is this unity of apperception which enables us to combine the data of more than one sense, to affirm reality, unreality, identity, difference, unity, plurality and so forth, as also the good, the beautiful and their contraries. Plato calls these perceptive factors in knowledge συνεισέρχεσθαι and describes them as developed by the soul in virtue of its own activity. They are objects of its reflection and made explicit in the few with pains and gradually. That they are not, however, psychological or acquired categories, due to the "workmanship of the mind" as conceived by Locke, is obvious from their attribution to the structure of mind and from their correlation with immanent principles of the objective order. Considered from the epistemological point of view, they are the implicit presuppositions of the construction of συνέλεγομεν in which knowledge consists. But as ideas, though of a type quite apart, they have also a constitutive application to reality. Accordingly, of the selected "kinds" by means of which the interpenetration of ideas is expounded in the Sophistes, only motion and rest, the ultimate "kinds" in the physical world, have no counterparts in the "categories" of the Theaetetus. In his doctrine as to ἐν τῷ νόμῳ ἢ κόσμῳ, as generally in what the activity of the νοῦς αἰσθάτος, Aristotle in the de Anima is in the main but echoing the teaching of Plato.1

10 For Plato's Logic, the controversies as to the genuineness of the dialogues may be treated summarily. The Theaetetus labour under no suspicion. The Sophistes is apparently matter for animadversion by Aristotle in the Metaphysics and elsewhere, but derives stronger support from the testimonies to the Politicus which purports it. The Politicus and Philaeus are guaranteed by the use made of them in Aristotle's Ethics. The rejection of the Parmenides would involve the paradox of a nameless contemporary of Plato

1 Aristotle, An. Pr. i. 31, 46a 32 sqq.: cf. 91b 12 sqq.
ii. Aristotle.

Plato's episodic use of logical distinctions 1 is frequent. His recourse to such logical analysis as would meet the requirements of the problem in hand 2 is not rare. In the "dialectical" dialogues the question of method and of the justification of its postulates attains at 2.1a 1 like prominence with the ostensible subject matter. There is even formal recognition of the fact that in advance to "dialectical", i.e., a greater thing than to bring any special inquiry to a successful issue. 3 But to the end there is a lack of interest in, and therefore a relative immaturity of, technique as such. In the forcing atmosphere, however, of that age of controversy, seed such as that sown in the master's treatment of the uttered ἰδέα 4 quickly germinated. Plato's successors in the Academy have developed a system of grammatical logical categories which Aristotle could make his own. Else much of his criticism of Platonic doctrine 5 does, indeed, miss fire. The gulf too, which the Philebus 6 apparently left unbridged between the sensuous apprehension of particulars and the knowledge of universals of even account of the generous leap 283a 284 and 285b, though such as this, in Aristotle 7, 8 and 9, and, for the most part, of probable interpretation only, complete the material which Aristotle could utilize when he seceded from the Platonic school and embarked upon his own course of logical inquiry.

This is embodied in the group of treaties later known as the Organon and culminates in the theory of syllogism and of demonstrative knowledge in the Analytics. All else is finally subsidiary. In the well-known sentences with which the Organon closes Aristotle has been supposed to lay claim to the discovery of the principle of syllogism. He at least claims to have been the first to dissect the procedure of the debate-game, and the larger claim may be

worth reservation. Aristotle was inferior as a metaphysician to neither. No other dialogue adjoins anything to the logical content of these.

Granted their genuineness, the relative dating of three of them is given, viz. Theaetetus, Sophist and Politicus in the order named. Their logic is a spurious, Politeia, 13a 285 b, but if this be an error, it will affect the logical theory not at all. There remains the Parmenides. It can scarcely be later than the Sophist. The antinomies with which it concludes are more naturally taken as a prelude to the conclusion of the Sophist than as an unnecessary retrieval of the doctrine of the one and the many in a more negative form. It may well be earlier than the Theaetetus in its present form. The stylistic argument shows the Theaetetus relates earlier. The maturity of its philosophic outlook tends to give it a place relatively advanced in the Platonic canon. To meet the problem here raised, the theory has been devised of an earlier and a later version. The first may have linked on to the series of Plato's dialogues, and the second, and that of the Parmenides before it, is impossible. The second, though it might still have preceded the Parmenides might equally well have followed the negative criticism of that dialogue, as the beginning of reconstruction. For Plato's logic this question only has interest of the doctrine of an Αριστοτέλης in a non-speaking part in the Parmenides. If this be pressed as suggesting that the philosopher Aristotle was already in full activity at the date of writing, it is of importance to know that Platonian dialogues were later than the debut of his critical pupil.

On the stylistic argument applied as to Platonic controversies Janell's Quaestiones Platonicae (1901) is important. On the whole question of the authenticity and date of the dialogues Platonis philosophicae Entwicklung (1905), gives an excellent account of the views held and the grounds alleged. See also Plato

6. Philebus, 16d.
8. Theaetetus, (2 vols., 1841-1846). Among the innumerable writers who have throw light upon Aristotle's logical doctrine, St Hilaire, Trendelenburg, Ueberweg, Hamilton, Munsell, G. Grote may be named. There are, however, others of equal weight. Reference to Frankl, op. cit., is indispensable. Zeller, Die Philosophie der Griechen, ii. 2. "Aristoteles" (3rd ed., 1879), pp. 285-287 (there is an Eng. transl.), and Maier, Die Syllogistik des Aristoteles (2 vols., 1896, 1900) (some 900 pp.), are also of first-rate importance.

Moreover, Aristotelian, Elench. 185, esp. b 1-3, but see Maier, loc. cit. i. 1

thought to follow. In the course of inquiry into the formal consequences from probable premises, the principle of mediation or linking was so laid bare that the advance to the analytic determination of the species and variety of syllogism was natural. Once embarked upon such an analysis, where valid process from assured principles gave true, Aristotle could find little difficulty in determining the formula of demonstrative knowledge or science. It must be grounded in principles of assured certainty and must demonstrate its conclusions with the use of such middle or linking terms only as it is possible to equate with the real ground or cause in the object of knowledge. Hence the account of axioms and of definitions, both of substances and of derivative attributes. Hence the importance of determining how first principles are established. It is, then, a fair working hypothesis as to the structure of the Organon to place the Topics, which deal with dialectical reasoning, before the Analytics. Of the remaining treatises nothing of fundamental import depends on this view. Doubt, that we have, is that we have in the main a reflex of the heuristic character of Aristotle's own work as pioneer. But it at least satisfies the requirement that the inquiry shall carry the plain man along with it. Actual modes of expression are shown to embody distinctions which average intelligence can easily recognize and will readily acknowledge, though they may tend by progressive rectification fundamentally to modify the assumption natural to the level of thought from which it begins. Thus we start from the point of view of a world of separate persons and things, in which thought mirrors these concrete realities, taken as ultimate subjects of predicates. It is a world of communication of thought, where persons as thinkers need to utter in language truths objectively valid for the mundus communis. In these truths predicates are accepted or rejected by subjects, and therefore depend on the reflection of fact in ἰδέα (propositions). These are combinatory of parts, attaching or detaching predicates, and so involving such as 183 d-2 are the result of subsequent editing and prove nothing. See, however, Aristotle.

12, 13 Adrastus is said to have called them τοῦ τῶν τοῖαν.

subject, predicate and copula. At this stage we are as much concerned with speech-forms as with thought-forms of which they are conventional symbols, with Plato's analysis, for instance, into a noun and a verb, whose connotation of time is as yet a difficulty. The universal of this stage is the universal of fact, what is recognized as predicatable of a plurality of subjects. The dialectical doctrine of judgment as the declaration of one member of a disjunction by contradiction, which is later so important, is struggling with one of its initial difficulties, viz. the contingency of particular events future, the solution of which remains imperfect.

The doctrine of the *Categories* is still on the same level of thought, though its grammatico-logical analysis is the more advanced one which had probably been developed by the Academy before Aristotle came to think of his friends there as "them" rather than "us." It is what in one direction gave the now familiar classification of parts of speech, in the other that of thought-categories underlying them. If we abstract from any actual combination of subject and predicate and proceed to determine the types of predicate asserted in simple propositions of fact, we have on the one hand a subject which is never object, a first substance or concrete thing, of which may be predicated in the first place a second substance, a subject, viz. concrete class, and in the second place quantity, quality, correlation, action and the like. The list follows the forms of the Greek language so closely that a category emerges appropriated to the use of the perfect tense of the middle voice to express the relation of the subject to a garb that it does. In all this the individual is the sole self-subsistent reality. Truth and error are about the individual and attach or detach predicates correctly and incorrectly. There is no commitment to the metaphysics in the light of which the logical inquiry is at last to find its complete justification. The point of view is to be modified profoundly by what follows—by the doctrine of the class-concept behind the class, of the form or idea as the constitutive formula of a substance, or, again, by the requirement that an essential attribute must be grounded in the nature or essence of the substance of which it is predicated, and that such attributes alone are admissible predicates from the point of view of the strict ideal of science. But we are still on the ground of common opinion, and these doctrines are not yet laid down as fundamental to the development.

Dialectic then, though it may prove to be the ultimate method of establishing principles in philosophy, starts from probable and conceded premises, and deals with them only in the light of common principles such as may be reasonably appealed to or easily established against challenge.

To the expert, in any study which involves contingent matter, i.e. an irreducible element of indetermination, e.g. to the physician, there is a specific form of this, but the reflection that this is so is something of an afterthought. We start with what is prima facie given, to return upon it from the ground of principles clarified by the sitting process of dialectic and certified by νοέσις. The *Topics* deal with dialectic and constitute an anatomy of argumentation, or, according to what seems to be Aristotle's own metaphor, a survey of the tactical vantage-points (vòròs) for the conflict of wits in which the prize is primarily victory, though it is a barren victory unless it is also knowledge. It is in this treatise that what have been called "the conceptual categories" emerge, viz. the *predicables*, or heads of predicate as it is analysed in relation to the provisional theory of definition that dialectic allows and requires. A predicate either is expressive of the essential or part of the essence of the subject, viz. that original group of mutually derivable attributes of which the absence of any one destroys its right to the class-name, or it is not. Either it is convertible with the subject or it is not. Here then judgment, though still viewed as combinatory, has the types which belong to coherent systems of implication discriminated from those that predicate coincidence or accident, i.e. any happening not even derivatively essential from the point of view of the grouping in which the subject has found a place. In the theory of dialectic any predicate may be "suggested for a subject, and if not affirmed of it, must be denied of it, if not denied must be affirmed. The development of a διάλεκτος of the ground on which subjects claim their predicates and disown alien predicates could not be long postponed. In practical dialectic the unlimited possibility was reduced to manageable proportions in virtue of the groundwork of received opinion upon which the operation proceeded. It is in the *Topics*, further, that we clearly have a first treatment of syllogism as formal implication, with the suggestion that advance must be made to a view of its use for material implication from true and necessary principles. It is in the *Topics*, again, that we have hints at the devices of an inductive process, which, as dialectical, throw the burden of producing contradictory instances upon the other party to the discussion. In virtue of the common-stock of opinion among the interlocutors and their potentially controlling audience, this process was more valuable than appears on the face of things. It is the syllogistic tentative, and with limits and ultimate intention of breaking down dialectic, which forms the transition from the dialectic thought of the *Topics* to the syllogism of the *Prior Analytics*, and then by the irony of fate to the discrediting of Aristotle. In any case, however, definition, syllogism, induction all invited further determination, especially if they were to take their place in a doctrine of truth or knowledge.

The problem of analytic, i.e. of the resolution of the various forms of inference into their equivalents in that grouping of terms or premises which was most obviously cogent, was a legacy of the *Topics*. The debate-game had sought for diversion and found truth, and truth raised the logical problem on a different plane. At first the problem of formal analysis only. We proceed with the talk of instances and concern ourselves first with relations of inclusion and exclusion. The question is as to membership of a class, and the dominant formula is the διάλεκτος de omni et nullo. Until the view of the individual units with which we are so familiar has undergone radical revision, the primary inquiry must be into the forms of a class-calculus. Individuals fall into groups in virtue of the possession of certain predicates. Does one group include, or overlap, with another? If it is compared it? We are clearly in the field of the diagrams of the *Prior Analytics* and much of the phraseology is based on an original graphic representation in extension. The middle term, though conceived as an intermediary or linking term, gets its name as intermediate in a homogeneous scheme of quantity, where it cannot be of narrower extension than the subject nor wider than the predicate of the conclusion. It is also, as Aristotle adds, middle in position in the syllogism that concludes to a universal affirmative. Again, so long as we keep to the syllogism as complete in itself and without reference to its place in the great structure of knowledge, the nerve of proof cannot be conceived in other than a formal manner. In analytic we work with an ethos different from that of dialectic. We presume truth and not probability or concession, but a true conclusion can follow from false premises, and it is only in the attempt to derive the premises in turn from their grounds that we unmask the deception. The passage to the conception of system is still required. The *Prior Analytics* then are concerned with a formal logic to be knit into a system of knowledge of the real only in the view of a formula which is at this stage still to seek. The forms of syllogism, however, are tracked successfully through their figures, i.e. through the positions of the middle term that Aristotle recognizes as of actual employment, and all their moods, i.e. all differences of affirmative and negative, universal and particular within the figures, the cogent or legitimate forms are

alone left standing, and the formal doctrine of syllogism is complete. Sylogism already defined becomes through exhibition in its valid form to clarify. It is a speech-and-thought-form (Logos) in which certain matters being posited something other than the matters posited necessarily results because of them, and, though it still needs to receive a deeper meaning when presumed truth gives way to necessary truth of premises, the notion of the class to that of the class-concept, collective fact to universal law, its formal claim is manifest. "Certain matters being posited." Subject and predicate not already seen to be conjoined must be severally known to be in relation with that which joins them, so that more than one direct conjunction must be given. "Of necessity." If what are to be conjoined are severally in relation to a common third it does perform relate or conjoin them. "Something other." The conjunction was by hypothesis not given, and is a new result by no means to be reached, apart from direct perception save by use of at least two given conjunctions. "Because of them," therefore. Yet so long as the class-view is prominent, there is a suggestion of a begging of the question. The class is either committed by enumeration of its members, and, passing away the difficulty involved in the view that knowledge is an empirical universal of fact merely, or it is grounded in the class-concept. In the first case it is a formal scheme which helps knowledge and the theory of knowledge not at all. We need then to develop the alternative, and to pass from the external aspect of all-ness to the intrinsic ground of it in the universal καθ' αυτὸ καὶ τὸ αὐτό, which, whatsoever the assistance it receives from induction in some sense of the word, in the course of its development for the individual mind, is secured against dependence on instances by the decisive fiat or guarantee of καθ' άυτό, insight into the systematic nexus of things. The conception of linkage needs to be deepened by the realization of the middle term as the ground of nexus in a real order which is also rational. Aristotle's solution of the paradox of inference, viz. of the fact that in one sense to go beyond what is in the premises is fallacy, while in another sense not to go beyond them is futility, lies in his formula of implicit and explicit, potential and actual.1 The real nexus underlying the thought-process is to be articulated in the light of the voucher by intelligence as to the truth of the principles of the various departments of knowledge which we call sciences, and at the ideal limit it is possible to transform syllogism into systematic presentation, so that, differently written down, it is definition. But for human thought sense, with its accidental setting in matter itself incognizable is always with us. The activity of καθ' άυτό is never so perfectly realized as to merge implication in intuition. Syllogism must indeed be objective, i.e. valid for any thinker, but it is also a process in the medium of individual thinking, whereby new truth is reached. A man may know that mules are sterile and that the beast before him is a mule, and yet believe her to be in foal "not viewing the several truths in connexion."2 The doctrine, then, that the universal premise contains the conclusion not otherwise than potentially is with Aristotle cardinal. The datum of sense is only retained through the universal. It is true that in scientific statement with which at the particular instances left uninvestigated.3 Recognition that the class-concept is applicable may be independent of knowledge of much that it involves. Knowledge of the implications of it does not depend on observation of all members of the class. Syllogism as formula for the exhibition of truth attained, and construction or what not as the instrumental process by which we reach the truth, have with writers since Hegel and Herbart tended to fall apart. Aristotle's view is other. Both are syllogisms, though in different points of view. For this reason, if for no other, the conception of movement from the potential possession of knowledge to its actualization remains indispensable.

1 Prior Analytics, i. 1, 24a 18-20, Συλλογισμός ἢ καθ' άυτό νῦν εν ἐν ενδοτικοῦ τινός τετῶν τοῖς κείμενοιν ἣ ἔνθερα αὐτόματα τά ταῦτα εἶναι. The equivalent previously in Ξυρίκας 1064 28 sqq. 2 Prior Analytics, i. 1, 67a 33-37, μὴ συμβολήν τοῦ καθ' άυτόν. 67a 39-40. 3 79a 4-5. Whether this is explanation or description, a problem or its solution, is of course another matter. In the Posterior Analytics the syllogism is brought into decisive connexion with the real by being set within a system in which its function is that of material implication from principles which are primary, immediate and necessary truths. Hitherto the assumption of the probable as true rather than as what will be conceded in debate4 has been the main distinction of the standpoint of analytic from that of dialectic. But the true is true only in reference to a coherent system in which it is an immediate ascertainment of τὸ αὐτό, or to be deduced from a ground which is such. The ideal of science or demonstrative knowledge is to exhibit as flowing from the definitions and postulates of a science, from its special principles, by the help only of axioms or principles common to all knowledge, and these not as premises but as guiding rules, all the properties of the subject-matter, i.e. all the predicates that belong to it in its own nature. In the case of any subject-kind, its definition and its existence being avouched by τὸ αὐτό, "heavenly body" for example, the problem is, given the fact of a non-self-substantive characteristic, how is the definition formed? In the case of the moon, a μέταφραστική which expressed the αὐτό, in virtue of which the adjectival concept can be exhibited as belonging to the subject-concept καθ' αὐτό in the strictly adequate sense of the phrase in which it means also ἔντον αὐτό.5 We are under the necessity then of revising the point of view of the syllogism of all-ness. We discard the conception of the universal as a predicate applicable to a plurality, or even to all, of the members of a group. To know merely κατὰ παράδοσιν is not to know, save accidentally. The exhaustive judgment, if attainable, could not be known to be exhaustive. The universal is the ground of the empirical "all" and not conversely. A formula such as the equality of the interior angles of a triangle to two right angles is only scientifically known when it is not of isosceles or scalene triangle that it is known, nor even of all the several types of triangle collectively, but as a predicate of triangle recognized as the widest class-concept of which it is true, the first stage in the progressive differentiation of figure at which it can be asserted.6 Three points obviously need development, the nature of definition, its connexion with the syllogism in which the middle term is cause or ground, and the way in which we have assurance of our principles.

Definition is either of the subject-kind or of the property that is grounded in it. Of the self-substantive definition is οὐλία τις γενέσις by exposition of genus and differentiation.7 It is indemonstrable. It presumes the reality of its subject in a postulate of existence. It belongs to the principles of demonstration. Summa genera and groups below infinitae species are indefinable. The former are susceptible of elucidation by indication of what falls under them. The latter are only describable by their accidents. There can here be no true differentia. The artificiality of the limit to the articulation of species was one of the points to which the downfall of Aristotle's influence was largely due. Of a non-self-substantive or attributive conception definition in its highest attainable form is a recasting of the syllogism, in which it was shown that the subject was grounded in the substance or self-substantive subject of which it is. Eclipse of the moon, e.g. is privation of light by the moon by the interposition of the earth between it and the sun. In the scientific syllogism the interposition of the earth is the middle term, the cause or "because" (ὅτι), the residue of the definition is conclusion. The difference then is in verbal expression, way of putting, inflexion.8 If we pluck 24b 10-11. 9 Posterior Analytics, i. 4 καθ' αὐτό means (1) contained in the definition of the subject (2) having the subject contained in its definition, as being an alternative determination of the subject, crooked, e.g. is per se of line; (3) self-substantive; (4) connected with the subject as consequent to ground. Its needs stricter determination therefore. 10 73b 26 sqq., 74a 37 sqq. 11 40b 16. 12 Metaphys. Z. 12, H. 6 ground this formula metaphysically. 13 44a 12, 75b 32.
the fruit of the conclusion, severing its nexus with the stock from which it springs, we have an imperfect form of definition, while, if further we abandon all idea of making it adequate by exhibition of its ground, we have, with still the same form of words, a definition merely nominal or lexicographical. In the aporetic treatment of the relation of definition and syllogism identical as to one form and in one view, distinct as to another form and in another view, much of Aristotle's discussion consists.

The middle term.

The rest is a consideration of scientific inquiry as converging in μέθοδον γίνοντα, the investigation of the link or "because" as ground in the nature of things. To μέθοδον γίνοντα τό μονο1 real ground and thought link fall together. The advance from syllogism as formal implication is a notable one. It is not enough to have for middle term a causa cognoscendi merely. We must have a causa essendi. The planets are near, and we know it by their not twinkling, but science must conclude their nearness as the cause of their not twinkling and make the prius in the real order the middle term of its syllogism. In this irreversible catena proceeding from ground to consequent, we have left far behind such things as the formal parity of genus and differentiation considered as falling under the same predicatible,2 and hence justified in part Porphry's divergence from the scheme of predicables. We need devices, indeed, to determine priority or superior claim to be "better known absolutely or in the order of nature," but on the whole the problem is fairly faced.3

Of science Aristotle takes for his examples sometimes celestial physics, more often geometry or arithmetic, sometimes a concrete science, e. g. botany.4 In the field of pure form, free from the disconcerting surprises of sensible matter and so of absolute necessity, no difficulty arises as to the deduction of the whole body of a science from its first principles. In the sphere of abstract form, mathematics, the like may be allowed, abstraction being treated as an elimination of matter from the σώματος by one act. When we take into account relative matter, however, and traces of a conception of abstraction as admitting of degree,4 the question is not free from difficulty. In the sphere of the concrete sciences where law obtains only ὡς ἐν τῷ πολέμῳ this ideal of science can clearly find only a relative satisfaction with large reserves. In any case, however, the problem as to first principles remains fundamental.

If we reject the infinite regress and the circle in proof (circularis in probando) which resolves itself ultimately into proving A by B and B by A,5 we are confronted by the need for principles of two kinds, those which condition all search for causes and those which are the peculiar or proper principles of special sciences, their "positions," viz. the definitions of their subjects and the postulates of the existence of these. All are indemonstrable and cannot be less sure than the body of doctrine that flows from them. They must indeed be recognized as true, primary, causative and the like. But they are not congenitally present in the individual in a determinate shape. The doctrine of latency is mystical and savours of Plato's reminiscence (anamnesis). Yet they must have something to develop from, and thereupon Aristotle gives an account of a process in the psychological mechanism which he illustrates by comparative psychology, wherein a λόγος or meaning emerges, a "first" universal recognized by induction. Yet ρίον, intelligence, is the principle of first principles.

It is infallible, while, whatever the case with perception of the special sensibles,6 the process which combines particulars is not. On the side of induction we find that experience is said to give the specific principles,7 the phenomena being apprehended in sufficiency. On the side of intuition, self-evidence of scientific principles is spoken of.8 Yet dialectic is auxiliary and of methodological importance in their establishment.9 Mutually limiting statements occur almost or quite side by side. We cannot take first principles "as the bare precipitate of a progressively refined analysis"10 nor on the other as constitutive a priori forms. The solution seems to lie in the conception of a process that has a double aspect. On the one hand we have confrontation with fact, in which, in virtue of the rational principle which is the final cause of the phenomenal order, intelligence will find satisfaction. On the other hand we have a stage at which the rational but as yet not reasoned concepts developed in the medium of the psychological mechanism are subjected to processes of reflective comparison and analysis, and, with some modification, maintained against challenge, till at length the ultimate universals emerge, which rational insight can posit as certain, and the whole hierarchy of concepts remains to be sutured in a coherent system. Aristotle's terminology is highly technical, but, as has often been observed, not therefore clear. Here two words at least are ambiguous, "principle" and "induction." By the first he means any starting point, "that from which the matter in question is primarily to be known,"11 particular facts therefore, premises, and what not. What then is meant by principles when we ask in the closing chapter of his logic how they became known? The data of sense are clearly not the principles in question here. The premises of scientific syllogisms may equally be dismissed. Where they are not derivative they clearly are definitions or immediate transcripts from definitions. There remain, then, primary definitions and the postulates of their realization, and the axioms or common principles, "which he must needs have who is to reach any knowledge."12 In the case of Aristotle, these former, special each to its own science, Aristotle may be thought to hold that they are the product of the psychological mechanism, but are ascertained only when they have faced the fire of a critical dialectic and have been accepted from the point of view of the integral rationality of the system of concepts. Axioms, on the other hand, in which the sciences interconnect13 through the employment of them in a parity of relation, seem to be implicit indeed in the psychological mechanism, but to come to a kind of explicitness in the first reflective reaction upon it, and without reference to any particular content of it. They are not to be used as premises but as immanent laws of thought, save only when an inference from true or admitted premises and correct in form is challenged. The challenge must be countered in a reducio ad impossibile in which the dilemma is put. Either this conclusion or the denial of rationality. Given these principles, however, may get a greater explicitness through dialectical treatment.14 The relation, then, of the two orders of principle to the psychological mechanism is different. The kind of warrant that intelligence can give to specific principles falls short of infallibility. Celestial physics, with its pure forms and void of all matter save extension, is not such an exemplary science after all. Rationality is continuous throughout. A λόγος emerges with some beings in direct sequence upon the persistence of impressions.15 Sense is of the "first" universal, the form, though not of the ultimate universal. The rally from the rout in Aristotle's famous metaphor is of units that already belong together, that are of the same regimen or order. On the other hand, rationality has two stages. In the one it is relatively immersed in sense, in the other relatively free. The same break is to be found in the conception of the relation of receptive to active mind in the treatise Of the Soul.16 The one is impressed by things and receives their form without their matter. The other is free from impression. It thinks the system of concepts freely on the occasion of the affections of the receptivity. Aristotle is fond of declaring that knowledge is of the universal, while existence or reality is individual. It seems to follow that the cleavage between knowledge and reality

is not bridged by the function of ρύεν in relation to "induction." What is known is not real, and what is real is not known. The phainomenon has its cause in the double sense of the word "universal" and a possible solution in the doctrine of εἶδος. The "form" of a thing constitutes it what it is, and at the same time, therefore, is constitutive of the group to which it belongs. It has both individual and universal reference. The individual is known in the εἶδος, which is also the first universal in which by analysis higher universals are discoverable. These are predicates of the object known, ways of knowing it, rather than the object itself. The suggested solution removes certain difficulties, but scarcely all. On seeing Callias my perception is of man, not Callias, or even man—Callias. The recognition of the individual is a matter of his accidents, to which even sex belongs, and the gap from lowest universal to individual may still be conceived as unbridged. It is in induction, which claims to start from particulars and end in universals, that we must, if anywhere with the confines of logical inquiry, expect to find the required bridge. The Aristotelian conception of induction, however, is somewhat ambiguous. He had abandoned for the most part the Platonic sense of the corresponding verb, viz., to lead forward to the as yet unknown, and his substitute is not quite clear. It is scarcely the military metaphor.

Conclusions as to Induction.

The aduding of a witness for which he uses the verb in an attitude that covers all the uses. Perhaps confrontation with facts is the general meaning. But how does he conceive of its operation? There is in the first place the action of the psychological mechanism in the process from discriminative sense upwards wherein we realize "first" universals. This is clearly an unreflective, prelogical process, not altogether lighted up by our retrojection upon it of our view of dialectical induction based thereon. The immanent rationality of this first form, in virtue of which at the stage when intelligence acts freely on the occasion of the datum supplied it recognizes the identity with its own self-conscious process, is what gives the dialectical type its meaning. Secondly we have this dialectical "induction as to particulars by grouping of similars" whose liability to rebuttal by an exception has been already noted in connexion with the limits of dialectic. This is the incomplete induction by simple enumeration which has so often been laughed to scorn. It is a heuristic process liable to failure, and its application by a nation of talkers even to physics where non-expert opinion is worthless somewhat discredited it. Yet it was the fundamental form of induction as it was conceived throughout the scholastic period. Thirdly we have the limiting cases of this in the inductive syllogism διὰ ἀρχήν, a syllogism in the third figure concluding universally, and yet valid because the copula expresses equivalence, and in analogy in which, it has been well said, instances are weighed and not counted. In the former it has been noted that Aristotle's illustration of the syllogism is a logical concept, but specific concepts into a generic concept, and that in the construction of definite inductions the ruling thought with Aristotle is already, though vaguely, that of causal relation. It appears safer, notwithstanding, to take the less subtle interpretation that dialectical induction struggling with instances is formally justified only at the limit, and that this, where we have exhausted and know that we have exhausted the cases, is in regard to individual subjects rarely and accidentally reached, so that we perform illustrate rather from the definite class-concepts falling under a higher notion. After

all, Aristotle must have had means by which he reached the conclusions that horses are long-lived and lack gall. It is only then in the rather mystical relation of ρύεν to the first type of induction as the process of the psychological mechanism that an indication of the direction in which the bridge from individual being to universal knowledge is to be found can be held to lie.

Enough has been said to justify the great place assigned to Aristotle in the history of logic. Without pressing metaphysical formulae in logic proper, he analysed formal implication, grounded implication as a mode of knowledge in the rationality of the real, and developed a justificatory metaphysic. He laid down the programme which the after history of logic was to carry out. We have of course abandoned particular logical positions. This is especially to be noted in the theory of the proposition. The individualism with which he starts, howsoever afterwards mitigated by his doctrine of ρύεν ᾽ ἐνάντια or εἶδος constituting the individual in a system of intelligible relations, confined him in an inadmissible way to the subject-affirmative formula. He could not recognize such vocables as the impersonals for what they were, and had perforce to ignore the logical significance of purely reciprocal judgments, such as those of equality. There was necessarily a "sense" or direction in every proposition, with more than the purely psychological import that the advance was from the already mastered and familiar taken as relatively stable, to the new and strange. Many attributes, too, were predicable, even to the end, in an external and accidental way, not being derivable from the essence of the subject. The thought of contingency was too easily applied to these attributes, and an unsatisfactory treatment of modality followed. It is indeed the doctrine of the intractability of matter to form that lies at the base of the paradox as to the disparateness of knowledge and the real already noted. On the one hand Aristotle by his doctrine of matter admitted a surd into his system. On the other, he assigned to ρύεν with its insight into rationality too high a function with regard to the concept in which the paradigm was present, a power to certify the truth of scientific principles. The example of Aristotle's view of celestial physics as a science of pure forms exhibits both points. On the Copernican change the heavenly bodies were recognized as concrete and yet subject to calculable law. Intelligence had warranted false principles. The moral is that of the story of the heel of Achilles.

To return to logic proper. The Aristotelian theory of the universal of science as secure from dependence on its instances and the theory of linking in syllogism remain a heritage for all later logic, whether accepted in precisely Aristotle's formula or no. It is because the intervening centuries had the Aristotelian basis to work on, sometimes in reduced quantity and corrupt form, but always in some quantity and some form, that the rest of our logical tradition is what it is. We stand upon his shoulders.

iii. Later Greek Logic.

After Aristotle we have, as regards logic, what the verdict of after times has rightly characterized as an age of Epigoni. So far as the period from Aristotle to Theophrastus by some meet only minor corrections and extensions of a formal kind. If there is conscious and purposely divergence from Aristotle, inquiry moves, on the whole, within the circle of ideas where Aristotleanism had fought its fight and won. Where new conceptions emerge, the imperfection of the instruments, mechanical and methodological, of the sciences renders them unfruitful, until their rediscovery in a later age. We have activity without advance, diversity without development. Attempts at comprehensiveness end in the compromises of eclectic.

Illustrations are not far to seek. Theophrastus and in general the elder Peripatetics, before the rise of new schools with new lines of cleavage and new interests had led to new antagonists. The Peripatetics. Their interests, however, lie in the scholarly sciences in which the substantive achievement of the school was to be found. With Theophrastus, accordingly, in his botanical inquiries, for example, the alternatives of classification, the normal sequence of such and such a character upon such another, the conclusion of rational probability, are what counts. It is perhaps not wholly fanciful to connect with this attitude the fact that Aristotle's pupils dealt with a suret hand than the master with the
conclusions from premises of unlike modality, and that a formal advance of some significance attributable to Theophrastus and Eudemus is the doctrine of the hypothetical and disjunctive syllogism.

The Stoics are of more importance. Despite the fact that their philosophic interests lay rather in ethics and physics, their activity in what they classified as the third department of speculation was enormous and has at least left ineffaceable traces in the history of philosophy. Logic, a science of word, and consciousness, impression and other technical words come to us, at least as technical words, from Roman Stoicism. Even inference, though apparently not a classical word, throws back to the Stoic name for the condition of their philosophy. 

From the later philosophic form guaranteed to conditions, sort for rhetoric, the Stoic can respect for sense. Many lines in the rhetoric of the seven schools, including that of the Stoics, were raised in connexion with the individualistic theory of perception with which the Stoics started, that one question of fundamental importance, viz. that of the criterion of truth, exercised its influence on the individuals of the Renaissance. Perceptions were established as the highest of their kind. The Stoic notion of one and half the being of its object. Its hold upon the object involved the discernment that it could but be that which it purported to be. Such "psychological certainty" was denied by their agonistic opponents, and in reference to special causes have the same modification of the doctrine of the Stoics kataleptik with a view to meet the critics, an approximation to a recognition that the primary conviction might meet with a counter-conviction, and that no resort but the search of inference was possible. The last resort and verification in the haphazard instance, under varying conditions, in actual working. The controversy as to the self-evidence of perception in which the New Academy effected some abortive result it seems to us. Distinctly, the Stoic-inference as such is happening, here seems to correspond to "meaning" as it is used as a technical phrase now-a-days. This anticipation was apparently sterile. Along the same lines is the use of the hypothetical form of the sentence, which was the treatment of the hypothetical form as the typical form of inference.

The Stoical categories, too, have an historical significance. They are apparently offered in place of those of Aristotle, an acquaintance with which, they say, they have in common. The linguistic side to "logical" theory with a natural development in rhetoric, the Stoics endeavoured to exercise considerations of language from the contrasted side. They offer pure categories arising in science, such as the mental, sensory and sometimes those that have the same sense. Yet the substance, quality, condition absolute and condition relative of Stoicism have no enduring influence outside the school, though they recur with eterics like Galen. The Stoics were too "scholastic" in their speculations.

In Epicureanism logic is still less in honour. The practical end, freedom from the bondage of things with the peace it brings, is all in all, and even scientific inquiry is only in place as a means to this end. Of the apparatus of method the less was made use of, for Epicureanism as an instrument of thought.

Yet, in falling back, with a difference, upon the atomism of Democritus, Epicurus had to face some questions of logic. In the inference from phenomena to further phenomena positive verification must be insisted upon, and the inference from one to another of mental causes, the atoms with their inaccessibility to sense, a different canon of validity obtains, that of non-contradiction. He distinguishes too between the inference to combination of atoms as units, such as the inference to atoms having the same sense. In the latter case alternatives may be acquiesced in. The practical aid of science is as well achieved as we set forth possible as in showing the actual cause. This pangenetic might easily have been a certain limit to the method as such as a belief in the plurality of causes in Mill's sense of the phrase. More probably it reflects the fact that Epicurus was, according to tradition through Nausiphanes, on the whole dominated by the dogmatism of his predecessors. This interest of Epicurean in science, without a calculus had necessarily proved sterile of determinate concrete results, and this was more than enough to ripen the naturalism of the utilitarian school into scepticism. Some reading between the lines of Epicurus has led the "logic" of Epicurus to have an effect on the modern world, but scarcely because of its deserts.

The school of Pyrrho has exercised a more legitimate influence. Many of the arguments by which the Sceptics enforced their ad- vanced skepticism we find, as it were, as the starting point of modern scepticism. But many also are, within the limits of the individualistic theory of knowledge, quite unanswerable. Hume had constant recourse to this armoury. The major premise of syllogism, says the Pyrrhonist, is established indubitantly from the particular instances. If there be but one of these uncovered by the generalization, this cannot be sound. If the crocodile moves its upper, not its lower, jaw, we may not say that all animals move the lower jaw. The conclusion then is really used to establish the major premise, rather than as a sufficient reason. Could Mill say more? But again, the inductive enumeration is either of all cases or of some only. The former is in an indeterminate or infinite subject-matter impossible. The latter is invalid.

The Sceptics. The primary conclusion of the Pyrrhonist suspension of judgment (παρατηρετός) is a hard thing to answer. It is natural, then, that the central contribution of the Sceptics to the knowledge controversy lies in the modes (μέθοδος) in which they have attempted to do the work. The Sceptics have, as a whole, elaborated with extreme care, and that they have a modern ring and are full of instruction even to-day. Scepticism, it must be confessed, was not the least well equipped to expose the bankruptcy of the Pyrrhonist philosophy. There was only once that the Sceptic's art of fence was developed. From the time of Pyrrho overlapping Aristotle himself, who seems to have been well content to use the feints of more than one school in combating those of his own school, and of those of others, he had a claim to get past his guard, down through a period in which the decadent academy under Carneades, otherwise dogmatic in its opposition, supplied new thrusts and parries, to Aenesidemus in the last century of our era, and in the first century A.D. there had been nothing of plasticity and continuous progress. In this matter the dogmatic schools offer a marked contrast. In especial it is an outstanding characteristic of the younger rivals to Aristotle's school that as they sprang up suddenly into being the contest of the Sceptic with it, so its apparent maturity was very sudden, and thereafter persisted for the most part in a retrograde tradition, modified only when confronted with the forces of indigible weakness. The 3rd century B.C. saw a time in which the close of Epicurus' activity, and the life-work of Chrysipus, the refounder of Stoicism, is complete before its close. And subsequent variations seem to have been relatively little in the world of an eclectic character. In the case of Epicureanism we can happily imagine that there are some schools of thought which remain committed to the doctrine of Lucretius with the recorded doctrine of the master. But the rule apparently obtains throughout that stereotype and compromise offered themselves as the exhaustive alternative. This is perhaps fortunate for the history of doctrine, for it produces the Pyrrhonist and its offspring, as the case of your Aspasiaus or Alexander of Aphrodisias, and the substitute for the critic, your Cicero, or your Galen with his attempt at comprehension of the Stoic categories and the like while starting from Aristotelianism that this greater unity is necessarily sought after the speculative and philosophical judgment is a line, in the other and philosophical scepticism, a line of the stereotyping of the systems, apart from political conditions, seems to have been the commonplace of science. Logic and theory of knowledge come further, and without living science, theory of knowledge loses touch with life, and logic becomes a mere division to mathematics. This is the difference of interest. Retribution of things with their appetency and rectitude, each to each. One day the sceptic fritters itself and another does it have its way. Plato is full of the faith of the mind of a mathematical physics. Aristotle is optimistic of achievement over the whole range of the sciences. But the doctrine of the Pyrrhonist takes the view that the failure of the logical inquiry to reach so elementary a conception as the nature of the sciences, the absence of chemistry from the circle of the sciences, the fact that the promise of the dawn and the relative achievement of the sciences is the hope of man. Here the Pyrrhonist idea of science remains dialectical, and a physical experiment is new in the age of Lucretius a. and of Empedocles. The cause of scepticism is the unsatisfying character of the creeds of such science, in conjunction with the familiar law that, in triangular or pluralism, triangular judgment has a limit.
based on compromise. A bastard Platonism through hostility to Stoicism may become agnostic. Stoicism through hostility to its sceptical critics may prefer to accept some of the positions of the dogmatic nihilists.

Of the later schools the last to arise was Neoplatonism. The mathematical sciences, at least, had not proved disappointing. For those of the school of Plato who refused the apostasy of the new academy, there was hope either in the mathematical side of the Platonic tradition or in its religious and theological side. Neoplatonism is philosophy become theosophy, or it is the sermon on the text that God geometrizes. It is of significance in the general history of thought as the one great school that developed after the decadence of the Platonic and Aristotelian schools in dialectal constructiveness. In the history of logic it is of importance because of its production of a whole series of commentators on the Aristotelian logic. Not only the Introduction of Porphyry, which had lasting effects on the Scholastic tradition, but the commentaries of the historians and Simplicius. It was the acceptance of the Aristotelian logic by Neoplatonism that determined the Aristotelian complexion of the logic of the next age. If Alexander is responsible for such doctrines as that of the prioria aequitas, it is to Porphyry, with his characteristically Platonist preference for the doctrine of universals, and for classification, that we owe the scholastic preoccupation with the realist controversy, and with the quinque voces, i.e. the Aristotelian predicables as restated by Porphyry.

B. Scholasticism

The living force in the spiritual life of the Roman empire was, after all, not philosophy, but religion, and specifically Christianity. With the extension of Christianity to the Gentile world it at length became necessary for it to orientate itself towards what was best in Greek culture. There is a Stoic element in the ethic of the Pauline epistles, but the theological affinity that the Johannine gospel, with its background of philosophic ideas, exhibits to Platonic and Neoplatonist teaching caused the effort at absorption to be directed rather in that direction. Neoplatonism had accepted the Aristotelian logic with its sharper definition than anything handed down from Plato, and, except the logic of the Sceptics, there was no longer any rival discipline of the like prestige. The logic of the Stoics had been discredited by the sceptical onset, but in any case there was no organon of a fitness even comparable to Aristotle's for the task of drawing out the implications of dogmatic premises. Aristotelian logic secured the imprimatur of the revived Platonism, and it was primarily because of this that it passed into the service of Christian theology. The contact of the Church with Platonism was on the mystical side. Orthodoxy needed to counter heretical logic not with mysticism, itself the fruitful mother of heresies, but with argument. Aristotelianism approved itself as the controversial instrument, and in due course held the field alone. The upshot is what is called Scholasticism. Scholasticism is the Aristotelianism of medieval orthodoxy as taught in the "schools" or universities of Western Europe. It takes form as a body of doctrine drawing its premises from authority, sometimes in secular matters from that of Aristotle, but normally from that of the documents and traditions of systematic theology, while its method it draws from Aristotle, as known in the Latin versions, mainly by Theophrastus, of some few treatises of the Organon together with the Isagoge of Porphyry. It dominates the centres of intellectual life in the West because, despite its claim to finality in its principles or premises, and to universality for its method, it represents the only culture of a philosophic kind available to the adolescent peoples of the Western nations just becoming conscious of their ignorance. Christianity was the one organizing principle that pulsed with spiritual life. The vocation of the student could find fulfillment only in the religious orders. Scholasticism embodied what the Christian community had saved from the wreckage of Greek dialectic. Yet with all its effective manipulation of the formal technique of its translated and mutilated Aristotle, Scholasticism would have gone under long before it did through the weakness intrinsic to its divorce of the form and the matter of knowledge, but for two reasons. The first is the filtering through of some science and some new Aristotelian learning from the Arabs. The second is the spread of Greek scholarship and Greek manuscripts westward, which was consequent on the Latin occupation of Constantinople in 1204. It was resisted by the opportunity which was afforded it of fresh draughts from the Aristotle of a less partial and purer tradition, and we have, accordingly, a golden age of revived Scholasticism beginning in the 13th century, admitting now within itself more differences than before. It is to the schoolmen of the two centuries preceding the Turkish capture of Constantinople that the controversial refinements usually associated with the name of Scholasticism are attributable. The Analytics of Aristotle now entered quite definitely into the logical thought of Scholasticism and we have the contrast of a logica vetus and logica nova.

That other matters, the pars logicia and Mnemonics adapted from Psellus and possibly of Stoic origin, entered too did not outweigh this advantage. Confrontation with the historical Aristotle may have brought but little comfort to the orthodox system, but it was a stimulus to dialectical activity within the schools. It provoked the distinction of what was true secundum fidem and what was true secundum rationem among even sincere champions of orthodoxy, and their opponents accepted with a smile so admirable a mask for that thinking for themselves to which the revival of hope of progress had spurred them. The pioneers of the Renaissance owe something of their strength to their training in the developments which the system that they overthrew underwent during this period. The respite, however, was short. The flight of Byzantine scholarship westward in the 15th century revealed, and finally, that the philosophic content of the Scholastic teaching was as alien from Aristotle as from the spirit of the contemporary revolt of science, with its cry for a new medicine, a new nautical astronomy and the like. The doom of the Scholastic Aristotle was nevertheless not the rehabilitation of the Greek Aristotle. Between him and the tide of feeling at the Renaissance lay the whole achievement of Arab science. That impatience of authority to which we owe the Renaissance, the Reformation and the birth of Nationalism, is not stilled by the downfall of Aristotle as the venera appellation of the schools. The appeal is to experience, somewhat vaguely defined, as against all authority, to the book of nature and no other. At last the world undertakes to enlarge the circle of its ideas.

C. The Renaissance

Accordingly what is in one sense the revival of classical learning is in another a recourse to what inspired that learning, and so is a new beginning. There is no place for a reformed Aristotelian logic, though the genius of Zabarella was there to attempt it. Nor for revivals of the competing systems, though all have their advocates. Scientific discovery was in the air. The tradition of the old world was too heavily weighted with the Ptolemaic astronomy and the like to be regarded as other than a bar to progress. But from the new point of view its method was inadequate too, its contentment with an induction that merely leaves an opponent silent, when experiment and the application of a calculus powerless within the possibilities. The transformation of logic lay with the transformation of science itself. It might in large part be by the enthusiasm of some of the philosophers of nature. Henceforth the Aristotelian logic, the genuine no less than the traditional, was to lie on the other side of the Copernican change.

The demand is for a new organon, a scientific method which shall face the facts of experience and justify itself by its achievement in the reduction of them to control. It is a notable feature of the new movement, that except verbally, in a certain licence of nominalist expression, due to the swing of the pendulum away from the realist doctrine of universals, there is little that we can characterize as Empiricism. Facts are opposed to abstract universals. Yes. Particulars to controlling formulae. No. Experience is appealed to as fruitful where the formal employment of syllogism is barren. But it is not mere induction, with its unanalysed concretes taken as ultimate that is set up as the substitute for deduction. Rather a scientific process, which as experiential may be called inductive, but which is in other regards deductive as syllogism, is set up in constrast to syllogism

---

1 See Journ. Recherches critiques sur l'âge et l'origine des traductions latines d'Aristote (1843).
enumeration and alike. This is to be seen in Zabarella, in Galilei, and in Bacon. The reformed Aristotelian logic of the first-named with its *inducere demonstrativa*, the mathematico-physical analysis followed by synthesis of the second, the *exclusive*, or method of exclusions of the last, agree at least in this, that the method of science is one and indivisible, while containing both an inductive and a deductive moment. That what, e.g., Bacon says of his method may run counter to this is an accident of the tradition of the quarrel with realism. So, too, with the scholastic universals. Aristotle's forms had been correlated, though inadequately, with the idea of function. Divorced from this they are fairly stigmatized as mental figments or branded as ghostly entities that can but block the path. But consider Bacon's own doctrine of forms. Or watch the mathematical physicist with his formulae. The practice of science looks onward as in the dawn of Greek philosophy, and subjectivism such as Hume's has as yet no hold. Bacon summing up the movement so far as he understood it, in a rather belated way, has no theory of knowledge beyond the metaphor of the mirror held up to nature. Yet he offers an ambitious logic of science, and the case is typical.

The science of the Renaissance differs from that of the false dawn in Greek times in the fact of fruitfulness. It had the advantage of having achieved the period of translatio. The field of counting numbers of which mathematics is the handmaiden upon which to build. It was in reaction against a dialectic and not immediately to be again entraped. In scientific method, then, it could but advance, provided physics and mathematics did not again fail of accord. Kepler and Galilei secured it against that disaster. The *ubi materia iki geometria* of the one is the battle-cry of the mathematico-physical advance. The scientific instrument of the other, with its moments of analysis and construction, *metodo risolitivo* and *metodo compositivo*, engineers the road for the advance. The new method of physics is verifiable by its fruitfulness, and so free of any immediate danger from dialectic. Its germinal thought may not have been new, but, if not new, it had at least needed rediscovery from the beginning. For it was to be once certain and experiential. A mathematico-physical calculus that would work was in question. The epistemological problem as such was out of the purview. The relation of physical laws to the mind that thought them was for the time a negligible constant. When Descartes, having faithfully and successfully followed the mathematico-physical inquiry of his predecesors, was driven by the same conception of magnitudes expressed by his geometry to raise the question how it was possible for him to know what in truth he seemed to know so certainly, the problem entered on a new phase. The scientific movement had happily been content for the time with a half which, then and there at least, was more than the whole.

Bacon was no mathematician, and so was out of touch with the main army of progress. By temperament he was rather with the Humanists. He was content to voice the cry for the overthrow of the dominant system as such, and to call for a new beginning, with no realist presuppositions. He is with the nominalists of the later Scholasticism and the naturalists of the early Renaissance. He echoes the cry for recourse to nature, for induction, for experiment. He calls for a logic of discovery. But at first sight there is little sign of any greater contribution to the reconstruction than is to be found in Ramus or many another dead thinker. The syllogism is ineffective, belonging to argumentation, and constraining assent where what we want is control of things. It is a mechanical combination of propositions as these of terms which are countermanded to express concepts of often ill-defined objects. The flight from a cursory survey of the so-called principles must give way to a gradual progress upward from propositions of minimum to those of medium generality, and in these consists the fruitfulness of science. Yet the induction of the Aristotelians, the dialectical of the *Topics*, content with imperfect enumeration and with showing the burden of disproof upon the critic, is puerile, and at the mercy of a single instance to the contrary.

In all this there is but little promise for a new organon. It is neither novel nor instrumental. On a sudden Bacon's conception of a new method begins to unfold itself. It is novel only in the sense that it is identical in purpose with the ascent from particulars. It were better called exclusive or elimination of the alternative, which Bacon proposes to achieve, and thereby guarantee his conclusion against the possibility of instance to the contrary.

Bacon's method begins with a digest into three tables of the facts relevant to any inquiry. The first contains cases of the occurrence of the quality under investigation, colour, e.g., or, at least, in varying combinations. The second notes its absence in the cases that are, in Bacon's word, *tenets so alien*. Terrain so far occupied by science might fairly have been looked for. The third registers its quantitative variation according to quantitative changes in its concomitants. The method now proceeds on the basis of the first table to set forth the possible suggestions as to a general explanatory formula for the quality in question. In virtue of the remaining tables it rejects any suggestion qualitatively or quantitatively inadequate. If one suggestion, and one alone, survives the process of attempted rejection it is the explanatory formula required. If no suggestions explained, then, it is provided to be had to certain devices of method, in the enumeration of which the methods of agreement, difference and concomitant variations* find a place, beside the crucial experiment, the glaring instance and the statistics of experience which declare the 'first birth. The "first birth" is relatively an imperfection of method, and a proof that the tables need revision. The positive procedure by hypothesis and verification is rejected by Bacon, who thinks of hypothesis as the wisp of science, and prefers the cumbersome machinery of negative reasoning.

Historically it appears to have been under the dominance of the Platonic metaphor of an alphabet of nature, with a consequent belief in the relatively small number of ultimate principles to be discovered by the method of Platonic *prinzipia*. Bacon, in contrast, thematized the *ambiguities* of dialectical associations and used experientially in application to his own molecular physics. True it is that the rejection of all the co-species is a long process, but what if therein their simultaneous or co-existent, or different, or worse, if divided and fall of their like to be determined sometimes, and the ideal of science is fully to determine all the species of the genus. This will need co-operative effort as described in the account of Solomon's House in the *New Atlantis*. But once the conceptions have been formed as between the collector of data on the one hand and the expert of method, the interpreter of nature at headquarters, on the other, and Bacon's attitude to hypothesis and to negative reasoning is at least inexplicable. The hypothesis of the collector, the man who keeps a rain-gauge, or the missionary among savages, is to be discounted from as a source of error. The expert on the other hand may be supposed, in the case of facts over which he has not himself brooded in the course of their acquisition, to approach them without preconception, which is the aim of the criticism in the isolation of any one of several co-ordinate inquiries. That Bacon underestimates the importance of selective and of provisional explanatory hypotheses even in such fields as that of chemistry, and, more typically, he is open to some criticism from the point of view that negative judgment is derivable as necessarily resting on positive presuppositions, may be true enough. It seems, however, no less true that the greatness of his conception of organized common effort in science has rarely met with due appreciation.

In his doctrine of *forms*, too, the "universal" of his logic, Bacon must at least be held to have been on a path which led forward and not back. His forms are principles whose function fails to be specified with a definiteness known to the *principia*. But they are in control of the activities and the production of the qualities of bodies. Forms are qualities and activities expressed in terms of the ultimate of nature, *i.e.*, normally in terms of collocations of matter or nodes of motion. (The human soul is still an exception.) Form is bound up with the conception of the molecular character of the latter, of whose qualities or activities it expresses in wider relations. A mode of motion, for instance, of a certain definite kind, is the form of heat. It is the recipe for, and at the same time is, heat, not merely for the body of the particular autumn. It is analysed by breaking the body into its elements, instead of their qualities and ways of behaviour, he would have been the logician of the chemical formula. Here, too, he has scarcely received his need of appreciation.

Bacon's notion of his influence on his successors has something to do with his sympathy with the Optimus of his enthusiasm for experience, or in the success with which he represents the cause of nominalism and in certain special devices of method handed down till, through Hume or Herschel, they affected the thought of Mill. For the rest he was too Aristotelian, if he take the word broadly enough, or, as the result of his Cambridge studies,

4 Bacon's Works, ed. Ellis and Spedding ii. 164-165.
too Ramisti, when the interest in scholastic issues was fading, to bring his original ideas to a successful market.

Bacon’s Logic, then, like Galilei’s, intended as a contribution to scientific method, a systematization of discovery by which, given the fact of knowledge, new items of knowledge may be acquired, failed to convince contemporaries and successors alike of its efficiency as an instrument. It was an ideal that failed to embody itself and justify itself by its fruits. It was otherwise with the mathematical instrument of Galilei.

Descartes stands in the following of Galilei. It is concurrently with signall success in the work of a pioneer in the mathematical

Descartes, the method of mathematics to embrace knowledge as a whole, and raises the ultimate issues of its presuppositions. In the mathematics we determine complex problems by a construction link by link from axioms and simple data clearly and distinctly conceived. Three moments are involved. The first is an induction, i.e. an exhaustive enumeration of the simple elements in the complex phenomenon under investigation. This resolution or analysis into simple, because clear and distinct, elements may be brought to a standstill again and again by obscurity and indistinctness, but patient and repeated revision of all that is included in the problem should bring the analytic process to fruition. It is impatience, a perversity of will, that is the cause of error. Upon the analysis there results intuition of the simple data. With Descartes intuition does not connote givenness, but its objects are evident at a glance when induction has brought them to light. Lastly we have deduction the determination of the most complex phenomena by a continuous synthesis or combination of the simple elements. Synthesis is demonstrative and complete. It is the virtue of this view of derived or mediate knowledge that Descartes speaks of the (subsumptive) syllogism as “of avail rather in the communication of what we already know.” Syllogism is not the synthesis which together with analysis goes to constitute the new instrument of science. The celebrated Regulae of Descartes are precepts directed to the achievement of the new methodological ideal in any and every subject matter, however reluctant.

It is the paradox involved in the function of intuition, the acceptance of the psychological characters of clearness and distinctness as warranty of a truth presumed to be sub-jective, that leads to Descartes’s distinctive contribution to the theory of knowledge. In order to lay bare the ground of certainty he raises the universal doubt, and, although, following Augustine, he finds its limit in the thought of the doubter, this of itself is not enough.Cogito, ergo sum. That I think may be admitted. What I think may still need validation. Descartes’s guarantee of the validity of our clear and distinct perceptions is the veracity of God. Does the existence of God in turn call for proof? An effect cannot contain more than its cause, nor the idea of a perfect Being find adequate source save in the actuality of such a Being. Thus the intuition of the casual axiom is used to prove the existence of that which alone gives validity to intuitions. Though the logical method of Descartes has a great and enduring influence, it is the dualism and the need of God to bridge it, the doctrine of “innate” ideas, i.e. of ideas not due to external causes nor to volition but only to our capacity to think, our disposition to develop them, and finally the ontological proof, that affect the thought of the next age most deeply. That essence in the supreme case involves existence is a thought which comes to Spinoza more easily, together with the tradition of the ordo geometricus.

D. MODERN LOGIC

1. The Logic of Empiricism

The path followed by English thought was a different one. Hobbes developed the nominalism which had been the hallmark of revolt against scholastic orthodoxy, and, when he brings this into relation with the analysis and synthesis of scientific

method, it is at the expense of the latter. With Hobbes, when Car

tesianism had raised the problem of the contents of conscious

ness, the spirit of Baconian positivism could not accept of any thing that bore the ill-omened name of innate ideas, elaborated a theory of knowledge which is psychological in the sense that its problem is how the simple data with which the individual is in contact in sensation are worked up into a system. Though he makes his bow to mathematical method, he, even more than Hobbes, misses its constructive character. The clue of mathematical certainty is discarded in substance in the English form of “the new way of ideas.” With Hobbes logic is a calculus of marks and signs in the form of names. Naming is what distinguishes man from the brutes. It enables him to fix fleeting memories and communicate with his fellows. He alone is capable of truth in the due conjunction or disjunction of names in propositions. Syllogism is simply summation of propositions, its function being communication merely. Analysis is the sole way of invention or discovery. There is more, however, in Hobbes, than the paradox of nominalism. Spinoza could draw upon him for the notion of genetic definition. Leibnitz probably owes to him the theory of calculating symbols, and the conception of demonstration as essentially a chain of definitions. His psychological account of syllogism is taken over by Locke. Hume derived from him the explanatory formula of the association of ideas, which is, however, still with Hobbes a fact to be accounted for, not a theory to account for, being grounded physically in “coherence of the matter moved.” Finally Mill took from him his definition of cause as sum of conditions, which played no small part in the applied logic of the 19th century.

Locke is of more importance, if not for his logical doctrine, at least for the theory of knowledge from which it flows. With Locke the mind is comparable to white paper on which the world of things records itself in ideas of sensation.

Simple ideas of sensation are the only points of contact we have with things. They are the atomic elements which “the work

manship of the understanding” can thereafter do no more than systematically compound and the like. It is Locke’s initial attribution of the primary role in mental process to the simple ideas of sensation that precludes him from the development of the conception of another sort of ideas, or mental contents that he notes, which are produced by reflection on “the operations of our own mind within us.” It is in the latter group that we have the explanation of all that marks Locke as a forerunner of the critical philosophy. It contains in germ a doctrine of categories discovered but not generated in the psychological processes of the individual. Locke, however, fails to “deduce” his categories. He has read Plato’s Theaetetus in the light of Baconian and individualist preconceptions. Reflection remains a sort of “internal sense,” whose ideas are of later origin than those of the external sense. His successors emphasize the sensationist elements, not the workmanship of the mind. When Berkeley has eliminated the literal materialism of Locke’s metaphors of sense-perception, Hume finds no difficulty in accepting the sensations as principles of the mind, in their own right, any nonsens

sible ground being always unknown. From a point of view purely subjectivist he is prepared to explain all that is to be left standing of what Locke ascribes to the workmanship of the mind by the principle of association or customary conjunction of ideas, which Locke had added a chapter to a later edition of his Essay explicitly to reject as an explanatory formula. Condillac goes a step farther, and sees no necessity for the superstructure at all, with its need of explanation valid or invalid. Drawing upon Gassendi for his psychological atomism and upon Hobbes for a thoroughgoing nominalism, he reproduces, as the logical conclusion from Locke’s premises, the position of Anti-thenes.

The last word is that "une science bien traitée n’est qu’une langue bien faite."1

Locke’s logic comprises, amid much else, a theory of general terms of definition, a view of syllogism 2 and a declaration as to the possibility of inference from particular to particular, 3 a distinction between propositions which are certain but trilling, and those which add to our knowledge though uncertain, and a doctrine of mathematical certainty. 4 As to the first, "words become general by being made the signs of general ideas, and ideas become general by separating from them" all "that may determine them to this or that particular existence. By this way of abstraction they are made capable of representing more individuals than one." This doctrine has found no acceptance. Not from the point of view for which idea means image. Berkeley, though at length the notions of spirits, acts and relations 5 give him pause, prefers the formula which Hume expresses in the phrase that "some ideas are particular in their nature but general in their representation," 6 and the history of abstraction is a discussion of the conditions under which one idea "stands for" a group. Not from those for whom general ideas mean schematic concepts, not imageable. The critic from this side has little difficulty in showing that abstraction as described by Locke and Berkeley is a non-Newtonian science was so rich that the scientific faith of naturalism was able to retain a place besides its epistemological creed that a logician of the school could arise whose spirit was in some sort Baconian, but who, unlike, Bacon, had entered the modern world, and faced the problems stated for it by Hume and by Newton.

Stuart Mill’s System of Logic marked a fresh stage in the history of empiricism, for the reason that it made the effort to hold an even balance between the two moments in the thought of the school. Agreement in the use of a common watchword had masked as it seems a real divergence of meaning and purpose. The apostles of inductive method had preached recourse to experience, but had meant thereby nature as a constituted order. They had devised canons for the investigation of the concrete problems of this, but had either ignored altogether the need to give an account of the mirroring mind, or, in the alternative had been, with some naïveté, content to assume that their nominalist friends, consistently their allies in the long struggle with tradition, could adequately supply or could effectively satisfy the need. The exponents of psychological atomism, on the other hand, with the association of ideas for their one principle of agglutination had come to mean by experience the mental phantasmagoria of the individual. They had undermined the foundations of scientific certainty, and so far as the fecundity of contemporary science did not give them pause, were ready, notwithstanding the difference of their starting-point, to acquiesce in the formula as well as the tenor of Pyrrhonism. They could concede the triumphant achievement of science only with the proviso that it must be assumed to fall within the framework of their nominalism. Mill aspired after a doctrine of method such as should satisfy the needs of the natural sciences, notably experimental physics and chemistry as understood in the first half of the 19th century and, mutatis mutandis, of the moral sciences naturalistically construed. In unifying with this the Associationism which he inherited, through his father, from Hume, he revealed at once the strength and weakness of the dual conception of naturalism. His rare thoroughness and rare candour made it at once unnecessary and impossible that the work should be done again.

If judged by what he denies, viz. the formal logic of Hamilton and Mansel, whose Aristotelian and scholastic learning did but accentuate their traditionalism, and whose acquisitiveness in consistency constituted in Mill’s view a discouragement of research, such as men now incline to attribute at the least equally to Hume’s idealism, Mill is only negatively justified. If judged by his positive contribution to the theory of method he may claim to find a more than negative justification for his teaching in its success. In the field covered by scholastic logic Mill is frankly associationist. He aims at describing what he

finds given, without reference to insensible implications of doubtful validity and value. The upshot is a psychological account of what from one aspect is evidence, from the other, belief. So he explains "concepts or general notions" by an abstraction which he represents as a sort of alt-relief operated by attention and fixed by naming, association with the name giving to a set of attributes a unity they otherwise lack. This is manifestly, when all is said, a particular psychological event, a collective fact of the associative consciousness. It can exercise no organizing or controlling function in knowledge. So again in determining the "import" of propositions, it is no accident that in all save existential propositions it is to the familiar rubrics of associationism—co-existence, sequence, causation and resemblance—that he refers for classification, while his general formula as to the conjunctions of connotations is associationist through and through. It follows consistently enough that inference is from the one propounded by him, given, even the ideas of mathematics to be hypothetical, and in theory knows nothing of a non-enumerative or non-associative universal. A premise that has the utmost universality consistent with this view can clearly be of no service for the establishment of a proposition that has gone to the making of it. Nor again of one that has not. Its use, then, can only be as a memorandum. It is a shorthand formula of registration. Mill's view of ratiocinative process clearly stands and falls with the presumed impossibility of establishing the necessity for universals of another type than his, for what may be called principles of construction. His critics incline to press the point that association itself is only intelligible so far as it is seen to depend on universals of the kind that he denies.

In Mill's inductive logic, the nominalistic convention has, through his tendency to think in relatively watertight compartments,4 faded somewhat into the background. Normally he thinks of what he calls phenomena no longer as psychological groupings of sensations, as "states of mind," but as things and events in a physical world howsoever constituted and apprehended. His free use of relating concepts, that of sameness, for instance, bears no impress of his theory of the general notion, and it is possible to put out of sight the fact that, taken in conjunction with his nominalism, it raises the whole issue of the possibility of the equivocal generation of formative principles from the given contents of the individual consciousness, in any manipulation of which they are already implied. Equally, too, the deductive character, apparently in intention as well as in actual fact, of Mill's experimental methods fails to recall the point of theory that the process is essentially one from particular to particular. The nerve of proof in the process by which he establishes causal conjunctions of unlimited application is naturally thought to lie in the special canons of the several processes and the axioms of universal and uniform causation which form their background. The conclusions seem not merely to fall within, but to depend on these organic and controlling formulae. They follow not merely according to them but from them. The reference to the rule is not one which may be made and normally is made as a safeguard, but one which must be made, if thought is engaged in a forward and constructive movement at all. Yet Mill's view of the function of "universal" propositions had been historically suggested by a theory—Dugald Stewart's—of the use of axioms.5 Once more, it would be possible to forget that Mill's ultimate laws or axioms are not in his view intuitions, nor forms constitutive of the rational order, nor postulates of all rational construction, were it not that he has established causal conjunctions of unlimited application.

It is because of the failure of this endeavour to bring the technique of induction within the setting of his Humian psychology of belief that the separation of his contribution to the applied logic of science from his sensationalism became necessary, as it happily

2. Cf. Mill, Autobiography, p. 159. "I grappled at once with the problem of Induction, postponing that of Reasoning." Ib. p. 182 (which he propounded with Mill), "I could make nothing satisfactory of Induction at this time."

was easy. Mill's device rested special inductions of causation upon the laws that every event has a cause, and every cause has always the same effect. It rested these in turn upon a general induction enumerative in character of enormous and practically infinite range and always uncontradicted. Though obviously not exhaustive, the unique extent of this induction was held to render it competent to give practical certainty or psychological necessity. A vicious circle is obviously involved. It is true, of course, that ultimate laws need discovery, that they are discovered in some sense in the medium of the psychological mechanism, and that they are nevertheless the grounds of all specific inferences. But that truth is not what Mill expounds, nor is it capable of development within the limits imposed by the associationist formula.

It is deservedly, nevertheless, that Mill's applied logic has retained its pride of place amid what has been handed on, if in modified shape, by writers, e.g., Sigwart, and Professor Bosanquet, whose theory of knowledge is quite alien from his. He prescribed regulative or limiting formulae for research as it was actually conducted in his world. His grasp of the procedure by which the man of science manipulated his particular concrete problems was admirable. In especial he showed clear understanding of the functions of hypothesis and verification in the investigations of the solitary worker, with his facts still in course of accumulation and needing to be lighted up by the scientific imagination. He was therefore enabled to formulate the method of what Bacon had tended to despire as merely the "first vintage." Bacon spent his strength upon a dream of organization for all future discovery. Mill was content to codify. The difference between Bacon and Mill lies chiefly in this, and it is because of this difference that Mill's contribution, spite of its debt to the Baconian tradition, remains both characteristic and valuable. It is of course possible to criticise even the experimental canons with some severity. The caveats, however, which are relevant within the circle of ideas within which Mill's lesson can be learned and improved on,4 seem to admit of being satisfied by relatively slight modifications in detail, or by explanations often supplied or easily to be supplied from points brought out amid the wealth of illustration with which Mill accompanied his formal or systematic exposition of method. The critic has the right of it when he points out, for example, that the practical difficulty in the Method of Agreement is not due to plurality of causes, as Mill states, but rather to intermixure of effects, while, if the canon could be satisfied exactly, the result would not be rendered uncertain in the manner or to the extent which he supposes. Again the formula of the Joint-Method, which contemplates the enumeration of cases which have nothing in common but the absence of one circumstance,6 is ridiculously unsound as it stands. Or, on rather a different line of criticism, the use of corresponding letters in the two series of antecedents and consequents, raises, it is said, a false presumption of correlation. Nay, even the use of letters at all suggests that the sort of analysis that actually breaks up its subject-matter is universally or all but universally applicable in nature, and this is not the case. Finally, the conditions of the methods are either realized or not. If they are realized, the work of the scientist falls entirely within the field of the processes preliminary to the satisfaction of the canon. The latter becomes a mere memorandum or formula of registration. So is it possible "to have the engine host with his own petar." But the conditions are not realized, and in an experiential subject-matter are not realizable. Not one circumstance only in common but apparently one relevant circumstance, a sort of necessary condition, which, if we add the qualification of relevance we destroy the cogency of the method. If we fail to add it, we destroy the applicability.

The objections turn on two main issues. One is the exaggeration of the possibilities of resolution into separate elements that is due to the acceptance of the postulate of an alphabet of nature. This so soon as noted can be allowed for. It is to the

4. The Insight, for instance, of F. H. Bradley's criticism, Principls of Logic, II, ii, 3, is somewhat dimmed by a lack of sympathy due to extreme difference in the point of view adopted.
combination of this doctrine with a tendency to think chiefly of experiment, of the controlled addition or subtraction of these elements one at a time, that we owe the theoretically premature linking of \( a \) as effect to \( A \) as cause. This too can be met by a modification of form. The other issue is perhaps of more significance. It is the oscillation which Mill manifests between the conception of his formula as it is actually applicable to concrete problems in practice, and the conception of it as an expression of a theoretical limit to practical procedure. Mill seems most often to think of the former, while tending to formulate in terms of the latter. At any rate, if relevance in \textit{proximo} is interpolated in the peccant clause of the canon of the Joint-Method, the practical utility of the method is rehabilitated. So too, if the canon of the Method of Agreement is never more than approximately satisfied, intermixture of effects will in practice mean that we at least often do not know the cause or antecedent equivalent of a given effect, without the possibility of an alternative said, it is on the whole in keeping with Mill's presuppositions to admit even in the case of the method of difference that in practice it is approximative and instructive, while the theoretical formula, to which it aims at approaching asymptotically as limit, if exact, is in some sense sterile. Mill may well have himself conceived his methods as practically fruitful and normally convincing with the limiting formula in each case more cogent in form but therewith merely the skeleton of the process that but now pulsed with life.

Enough has been said to show why the advance beyond the letter of Mill was inevitable while much in the spirit of Mill must necessarily affect deeply all later experientialism. After Mill experientialism takes essentially new forms. In part because of what Mill had done. In part also because of what he had left undone. After Mill means after Kant and Hegel and Herbert, and it means after the emergence of evolutionary naturalism. Mill, then, marks the final stage in the achievement of a great school of thought.

ii. \textit{The Logic of Rationalism.}

A fundamental contrast to the school of Bacon and of Locke is afforded by the great systems of reason, owning Cartesian inspiration, which are identified with the names of Spinoza and Leibnitz. In the history of logic the latter thinker is of the more importance. Spinoza's philosophy is expounded \textit{ordine geometrico} and with Euclidean cogency from a relatively small number of definitions, axioms and postulates. But how we reach our assurance of the necessity of these principles is not made specifically clear. The invaluable tractate \textit{De Intellectuali emendatione}, in which the agreement with and divergence from Descartes on the question of method could have been fully elucidated, is unhappily not finished. We know that we need to pass from what Spinoza terms \textit{experientia sana},{1} where imagination with its fragmentary apprehension is liable to error and neither necessity nor impossibility can be predicated, right up to that which \textit{ficionem terminal}—namely, \textit{intellectio}. And what Spinoza has to say of the requisites of definition and the marks of intuition makes it clear that insight comes with coherence, and that the work of method on the \textit{inductive} side is by means of the unravelling of all that makes for artificial limitation to lay bare what can then be seen to exhibit nexus in the one great system. When all is said, however, the geometric method as universalized in philosophy is rather used by Spinoza than expounded.

With Leibnitz, on the other hand, the logical problem holds the foremost place in philosophical inquiry.\textsuperscript{2} From the purely logical thesis, developed at quite an early stage of his thinking,\textsuperscript{3} that in any true proposition the predicate is contained in the subject, the main principles of his doctrine of Monads are derivable with the minimum of help from his philosophy of dynamics. \textit{Pradecatum inest subiecto.} All valid propositions express in the last resort the relation of predicate or predicates to a subject, and this Leibnitz holds after considering the case of relational propositions where either term may hold the position of grammatical subject, \( A = B \) and the like. There is a subject then, or there are subjects which must be recognized as not possible to be predicated, but as absolute. For reasons not purely logical Leibnitz declares for the plurality of such subjects. Each contains all its predicates: and this is true not only in the case of truths of reason, which are necessary, and ultimately to be exhibited as coming under the law of contradiction, \textit{"or}, what comes to the same thing, \textit{that of identity,}" but also in the case of truths of fact which are contingent, though a sufficient reason can be given for them which \textit{"inclines"} without importing necessity. The extreme case of course is the human subject. \"The individual notion of each person includes once for all what is to befall it, world without end,\" and \"it would not have been our Adam but another, if he had had other events.\" If we may pass by the doctrine eternally all their successive predicates in the time-series, are substances, which when the problems connected with their activity, or dynamically speaking their force, have been resolved, demand—and supply—the metaphysic of the Monadology.

Complex truths of reason or essence raise the problem of definition, which consists in their analysis into simpler truths and ultimately into simple—\textit{i.e.} indefinable ideas, with primary principles of another kind—axioms, and postulates that neither need nor admit of proof. These are identical in the sense that the opposite contains an express contradiction.\textsuperscript{4} In the case of non-identical truths, too, there is a priori proof drawn from the notion of the terms, \"though it is not always in our power to arrive at this analysis,\"\textsuperscript{5} so that the question arises, specially in connexion with the possibility of a calculus, whether the contingent is reducible to the necessary or identical at the ideal limit. With much that suggests an affirmative answer, Leibnitz gives the negative. Even in the case of the Divine will, though it be always for the best possible, the sufficient reason will \"incline without necessitating,\" The propositions which deal with actual existence are still of a unique type, with whatever limitation to the calculus.

Leibnitz's treatment of the primary principles among truths of reason as identities, and his examples drawn \textit{inter alia} from the \"first principles\" of mathematics, influenced Kant by antagomism. Identities some of them manifestly were not. The formula of identity passed in another form to Herbert and therefore to Lotze. In recognizing, further, that the relation of an actual individual fact to its sufficient ground was not reducible to identity, he set a problem diversely treated by Kant and Herbert. He brought existential propositions, indeed, within a rational system through the principle that it must be feasible to assign a sufficient reason for them, but he refused to bring them under the conception of identity or necessity, \textit{i.e.} to treat their opposites as formally self-contradictory. This bore interest in the Kantian age in the treatment alike of cause and effect, and of the ontological proof of existence from essence. Not that the Law of Sufficient Reason is quite free from equivocation. Propositions concerning the \textit{possible} existence of individuals put Leibnitz to some shifts, and the difficulty accounts for the close connexion established in regard to our actual world between the law of sufficient reason and the doctrine of the final cause. This connexion is something of an afterthought to distinguish from the potential contingency of the objectively possible the real contingency of the actual, for which the \textit{\"cause or reason\"} of Spinoza could not account. The law, however, is not invalidated by these considerations, and with the degree of emphasis and the special setting that Leibnitz gives the law, it is definitely his own, the most tenable of the dualities of the doctrine of the Indiscernibles which played a part of some importance in subsequent philosophy, and the Law of Continuity, which as Leibnitz represents it, is, if not sheer dogma, reached by something very like a fallacy.

1. \textit{Bacon, Novum organum}, i. 100.
3. See esp. \textit{his} \textit{system}, the main principles of his doctrine of Monads are derivable with the minimum of help from his philosophy of dynamics. \textit{Pradecatum inest subiecto.} All valid propostions express in the last resort the relation of predicate or predicates to a subject, and this Leibnitz holds after considering the case of relational propositions where either term may hold the position of grammatical subject, \( A = B \) and the like. There is a subject then, or there are subjects which must be recognized as not possible to be predicated, but as absolute. For reasons not purely logical Leibnitz declares for the plurality of such subjects. Each contains all its predicates: and this is true not only in the case of truths of reason, which are necessary, and ultimately to be exhibited as coming under the law of contradiction, \"or, what comes to the same thing, \textit{that of identity,}\" but also in the case of truths of fact which are contingent, though a sufficient reason can be given for them which \textit{"inclines"} without importing necessity. The extreme case of course is the human subject. \"The individual notion of each person includes once for all what is to befall it, world without end,\" and \"it would not have been our Adam but another, if he had had other events.\" If we may pass by the doctrine eternally all their successive predicates in the time-series, are substances, which when the problems connected with their activity, or dynamically speaking their force, have been resolved, demand—and supply—the metaphysic of the Monadology.

6. \textit{Spinoza}, ed. van Vloten and Land, i. 46 (\textit{Ethica}, i. 11).
we have as Leibnitz's remaining legacy to later logicians the conception of Characteristica Universalis and Ars Combinatoria, a universal denoting by symbols and a calculus working by substitutions and the like. The two positions that a subject contains all its predicates and that all non-contingent propositions—i.e. all propositions not concerned with the existence of individual facts ultimately analyse out into identities—obviously lend themselves to the design of this algebra of thought, though the mathematician in Leibnitz should have been aware that a significant equation is never an identity. Leibnitz, fresh from the battle of the calculus in the mathematical field, and with his conception of logic, at least in some of its aspects, as a generalized mathematic, found a fruitful inspiration, harmonizing well with his own metaphysic, in Bacon's alphabet of nature. He, too, was prepared to offer a new instrument. That the most important section, the list of forms of combination, was never achieved—this too was after the Baconian example while the mode of symbolization was crude with a = ab and the like—matters little. A new technique of manipulation—it is, of course, no more—had been evolved.

It may be said that among Leibnitz's successors there is no Leibnitzian. The system as a whole is something too artificial to secure a whole-hearted allegiance. Wolff's formalism is the bastard outcome of the speculation of Leibnitz, and is related to it as remotely as Scholasticism is to Aristotle. Wolff found a sufficient reason for everything and embodied the results of his inquiries in systematic treatises, sometimes in the vernacular. He also, by a transparent petito principii, brought the law of the sufficient reason under that of non-contradiction. Wolff and his numerous followers account for the charge of dogmatism against "the Leibnitzio-Wolffian school." They are of importance in the history of logic for two reasons only: they affected strongly the German vocabulary of philosophy and they constituted the intellectual environment in which Kant grew to manhood.

A truer continuator of Leibnitz in the spirit was Herbart.

iii. Kant's Logic.

Herbart's admitted allegiance, however, was Kantian with the qualification, at a relatively advanced stage of his thinking, that it was "of the year 1788"—that is, after controversy had brought out implications of Kant's teaching not wholly contemplated by Kant himself. The critical philosophy had indeed made it impossible to hark back to Leibnitz or any other master otherwise than with a difference.

Yet it is not a single and unambiguous logical movement that derives from Kant. Kant's lesson was variously understood and various movements in it were emphasized, with a large diversity of result. As interpreted it was acquainted in or revoked from and revolt ranged from a desire for some modifications of detail or expression to the call for a radical transformation. Grounds for a variety of developments are to be found in the imperfect harmonization of the rationalistic heritage from the Wolffian tradition which still dominates Kant's pure general logic with the manifest epistemological intention of his transcendental theory. Or again, within the latter in his admission of a duality of thought and "the given" in knowledge, which within knowledge was apparently irreducible, concurrently with hints as to the possibility, upon a wider view, of the sublation of their disparateness at least hypothetically and speculatively. The sense in which there must be a ground of the unity of the supersensible while yet the transcendental use of Reason—i.e. its use beyond the limits of experience was denied theoretical validity—was not unnaturally regarded as obscure.

Kant's treatment of technical logic was wholly traditional, and in itself is almost negligible. It is comprised in an early essay on the mistaken sublyte of the syllogistic figures, and a late compilation by a pupil from the introductory matter and running annotations with which the master had enriched his interleaved lecture-room copy of Meyer's Compendium of 1752. Wolff's general logic, "the best," said Kant, "that we possess," had been abridged by Baumgarten and the abridgment then subjected to commentary by Meyer. With this traditional body of doctrine Kant was, save for matters of minor detail, quite content. Logic was of necessity formal, dealing as it must with those rules without which no exercise of the understanding would be possible at all. Upon abstraction from all particular methods of thought these rules were to be discerned a priori or without dependence on experience by reflection solely upon the use of the understanding in general. The science of the form of thought abstracted in this way from its matter or content was regarded as of value both as præpædæus and as canon. It was manifestly one of the disciplines in which a position of finality was attainable. Aristotle might be allowed, indeed, to have omitted no essential point of the understanding. What the moderns had achieved consisted in an advance in accuracy and methodical completeness. Indeed, we do not require any new discoverers in logic,1 said the discoverer of a priori synthesis, "since it contains merely the form of thought." Applied logic is merely psychology, and not properly to be called logic at all. The technical logic of Kant, then, justifies literally a movement among his successors in favour of a formal conception of logic with the law of contradiction and the doctrine of formal implication for its equipment. Unless the doctrine of Kant's "transcendental logic" must be held to supply a point of view from which a logical development of quite another kind is inevitable, Kant's mantle, so far as logic is concerned, must be regarded as having fallen upon the formal logicians.

Kant's transcendental teaching is summarily as follows: "Transcendental" is his epithet for what is neither empirical—i.e. to be derived from experience—nor yet transcendental—i.e. applicable beyond the limits of experience, the mark of experience being the impotence of the transcendental "of sense or of something which thought contrariwise distinguishes from its own spontaneous activity as in some sense the "given." Those features in our organized experience are to be regarded as transcendentally established which are the presuppositions of our having that experience at all. Since they are not empirical they must be structural and belong to "the mind"—i.e. the normal human intelligence, and to like intelligence so far as like. If we set aside such transcendental conditions as belong to sensibility or to the receptive phase of mind and are the presuppositions of juxtaposition of parts, the remainder are ascribable to spontaneity or understanding, to thought with its unifying, organizing or focussing function, and their elucidation is the problem of transcendental analytic. It is still logical, indeed, when we are occupied with the transcendental objects of the discursive faculty as it is employed beyond the limits of experience where it cannot validate its ideas. Such a logic, however, is a dialectic of illusion, perplexed by paradoxes and helpless in the face of antinomies, and therefore of little value. All transcendental treatment is erecting the conditions of experience, and we have a logic of cognition in which we may establish our epistemological categories with complete validity. Categories are the forms according to which the combining unity of self-consciousness (synthetic unity of apperception) personifies itself through the various functions involved in the constitution of objectivity in different types of the one act of thought, viz. judgment. The clue to the discovery of transcendental conditions Kant finds in the existence of judgments, most manifest in mathematics and in the pure science of nature, which are certain, yet not trilling, necessary and yet not reducible to identities, synthetic therefore and a priori, and so accounted for neither by Locke nor by Leibnitz. There lies a transcendental condition at the basis of every necessity.2

Kant's mode of conceiving the activity of thought in the constitution of objects and of their connexion in experience

was thought to lie open to an interpretation in conformity with the spirit of his logic, in the sense that the form and the content of knowledge are not merely distinguishable functions within an organic whole, but either separable, or at least indifferent one to the other in such a way as to be clearly independent. Thought as form would thus be a factor or an element in a composite unit. It would clearly have its own laws. It would be the whole concern of logic, which, since in it thought has itself for object, would have no reference to the other term of the antithesis, nor properly and immediately to the knowledge which is compact of thought in conjunction with something which, whatever it may be, is prima facie other than thought. There is too much textual warrant for this interpretation of Kant’s meaning. Doubtless there are passages which make against an extreme dualistic interpretation. Even in his “logic” Kant speaks of abstractions from all particular objects of thought rather than of a resolution of concrete thinking into thought and its “other” as separable co-operating factors in a joint product. He spoke throughout, however, as if form and content were mutually indifferent, so that the abstraction of form from content implied nothing of falsification. It is, therefore, that it was abstraction and not a decomposing that was in question remained to the admirers of his logic quite nugatory. They failed to realize that permissible abstraction from specific contents or methods of knowledge does not obliterate reference to matter or content. They passed easily from the acceptability of a priori forms of thinking to that of forms of a priori thinking, and could plead the example of Kant’s logic.

Kant’s theory of knowledge, then, needed to be pressed to other consequences for logic which were more consonant with the spirit of the Critique. The forms of thought and what gives thought its particular content in concrete acts of thinking could not be regarded as subsisting in a purely external and indifferent relation one to the other. “Laws according to which the subject thinks” and “laws according to which the object is known” cannot be the concern of separate departments of inquiry. As soon divorce the investigation of the shape and material of a mirror from the laws of the incidence of the rays that form images in it, and call it a science of reflection! An important group of writers developed the concept of an adaptation between the two sides of Kant’s antithesis, and made the endeavour to establish some kind of correlation between logical forms and the process of the “given.” There was a tendency to fall back upon the conception of some kind of parallelism, whether it was taken to be interpretative or rather corrective of Kant’s meaning. This device was never remote from the constructions of writers for whom the teaching of Spinoza and Leibnitz was an integral part of their intellectual equipment. Other modes of correlation, however, find favour also, and in some variety. Kant is seldom the sole source of inspiration. His unresolved antithesis1 is interpreted either diversely or with a difference of emphasis. And the light that later writers bring to bear on Kant’s logic and epistemology from other sides of his speculation varies in kind and in degree.

Another logical movement springs from those whom a correlation of fact within the unity of a system altogether failed to satisfy. There must also be development of the correlated terms from a single principle. Form and content must not only correspond one to the other. They must be exhibited as distinguishable moments within a unity which can at one and the same time be seen to be the ground from which the distinction springs and the ground in virtue of which it is over-ruled. Along this line of speculation we have a logic which claims that whatsoever is in one plane or at one stage in the development of thought a residuum that apparently defies analysis must at another stage and on a higher plane be shown so to be absorbed as to fall altogether within thought. This is the view of Hegel upon which logic comes to coincide with the progressive self-unfolding of thought in that type of metaphysic which is known as absolute, i.e. all-inclusive Idealism. The exponent of logic as metaphysic, for whom the rational is the real is necessarily in revolt against the Kantian in the theory of knowledge, against the transcendental method itself and against the doctrine of limits which constitutes the nerve of “criticism.” Stress was to be laid upon the constructive character of the act of thought which Kant had recognized, and without Kant’s qualifications of it. In all else the claim is made to have left the Kantian teaching behind as a cancelled level of speculation.

Transcendental method is indeed not invulnerable. A principle is transcendentially “deduced” when it and only it can explain the validity of some phase of experience, some order of truths. The order of truths, the phase of experience and its certainty had to be taken for granted. The sense, for example, in which the irreversibility of sequence which is the more known in ordine ad hominem in the case of the causal principle differs from merely psychological conviction is not made fully clear. Even so the inference to the a priori ground of its necessity is, it has been often pointed out, subject to the limitation inherent in any process of reduction, in any regress, that is, from conditionate to condition, viz. that an alternative is still possible. The inferred principle may hold the field as explanation without obvious competitor potential or actual. Nevertheless its claim to be the sole possible explanation can in nowise be validated. It has been established after all by dialectic in the Aristotelian sense of the word. But if transcendental method has no special pride of place, Kant’s conclusion as to the limits of the competence of intellectual faculties falls with it. Cognition manifestly needs the help of Reason even in its theoretical use. Its speculation can no longer be stigmatized as vaticination in vacuo, nor its results as illusory.

Finally, to logic as metaphysic the polar antithesis is psychology as logic. The turn of this also was to come again. If logic were treated as merely formal, the stress of the problem of knowledge fell upon the determination of the processes of the psychological mechanism. If alleged a priori constituents of knowledge—such rubrics as substance, property, relation—come to be explained psychologically, the former hypothesis to ignore all that belongs to psychology is confined within too narrow a range to be able to maintain its place as an independent discipline, and tends to be merged in psychology. This tendency is to be seen in the activity of Fries and Herbart and Beneke, and was actualized as the aftermath of their speculation. It is no accident that it was the psychology of apperception and the voluntarist theory or practice of Herbart, whose logical theory was so closely allied to that of the formal logicians proper, that contributed most spring from a common stock, though to use unknown—namely sense and understanding.” Some indication of the way in which he would hypothetically and speculatively mitigate the antithesis is perhaps afforded by the reflection that the distinction of the mental and what appears as material is an external distinction in which the one appears outside to the other. “Yet what as thing-in-itself lies back of the phenomenon may perhaps not be so wholly disparate after all” (ib. p. 278, ll. 26 sqq.).
to the development of the post-Kantian psychological logic. Another movement helped also: the exponents of naturalistic evolution were prepared with Spencer to explain the so-called a priori in knowledge as in truth a posteriori, if not to the individual at any rate to the race. It is of course a newer type of psychological logic that is in question, one that is aware of Kant’s "answer to Hume." Stuart Mill, despite of his relation of antagonism to Hamilton and Mansel, who held themselves to be Kantian in spirit, is still wholly pre-Kantian in his outlook.

Kant’s influence, then, upon subsequent logic is least of all to be measured by his achievement in his professed contribution to technical logic. It may be attributed in some slight degree, perhaps, to incidental flashes of logical insight where his thought is least of what he himself calls logic, e.g. his exposition of the significance of synthetic judgments a priori, or his explanation of the function of imagery in relation to thought, whereby he offers a solution of the problem of the conflict between what is abstractive through a concept can be taken to stand for the rest, or again the way in which he puts his finger on the vital issue in regard to the alleged proof from essence to existence, and illustrations could be multiplied. But much more it belongs to his transformation of the epistemological problem, and to the suggestiveness of his philosophy as a whole for an advance in the direction of a speculative construction which should be able to cancel all Kant’s surds, and in particular vindicate a "ground of the unity of the supersensible which lies back of nature with that which the concept of freedom implies in the sphere of practice," which is what Kant finally asserts.

iv. After Kant.

Starting from the obvious antithesis of thought and that of which it is the thought, it is possible to view the ultimate relation of its term as that of mutual indifference or, secondly, as that of a correspondence such that while they retain their distinct character modification of the one implies modification of the other, or thirdly and lastly, as that of a merger of one in the other of such a nature that the merged term, whichever it be, is fully accounted for in a complete theory of that in which it is merged.

The first way is that of the purely formal logicians, of whom Twisten1 and in England H. L. Mansel may be regarded as typical. They take thought and "the given," as self-contained units which, if not in fact separable, are at any rate susceptible of an abstraction the one from the other so decisive as to constitute an ideal separation. The laws of the pure activity of thought must be independently determined, and since the contribution of thought to knowledge is form they must be formal only. They cannot go beyond the limits of formal consistency or analytic correctness. They are confined to the determination of what the truth of any matter of thought, taken for granted upon grounds psychological or other, which are extraneous to logic, includes or excludes. The unit for logic is the concept taken for granted. The function of logic is to exhibit its formal implications and repulsions.

It is questionable whether even this modest task could be really achieved without other reference to the content abstracted from than Mansel, for example, allows. The analogy of the reproduction of a chemical compound with its elements which is often on the lips of those who would justify the independence of thought and the real world, with an agnostic conclusion as to non-phenomenal or trans-subjective reality, is not really applicable. The oxygen and hydrogen, for example, into which water may be resolved are not in strictness indifferent one to the other, since both are members of an order regulated according to laws of combination in definite ratios. Or, if applicable, it is double-edged. Suppose oxygen to be found only in water. Were it to become conscious, would it therefore follow that it could infer the laws of a separate or independent activity of its own? Similarly forms of thinking, the law of contradiction not excepted, have their meaning only in reference to determinate content, even though distributively all determinate contents are dispensable. The extreme formalist is guilty of a fallacy of composition in regard to abstraction.

It does not follow, however, that the laws asserted by the formal logicians are invalid or unimportant. There is a permissible abstraction, and in general they practise this, and although they narrow its range unduly, it is legitimately to be applied to certain characters of thinking. As the living organism includes something of mechanism—the skeleton, for example—so an organic logic doubtless includes determinations of formal consistency. The skeleton is meaningless apart from reference to its function in the life of an organism, yet there are laws of skeleton structure which can be studied with most advantage if the organism is relegated to the background. To allow, however, that abstraction admits of degrees, and that it never obliterates all reference to that from which it is abstracted, is to take a step forward in the direction of the correlation of logical forms with the concrete processes of actual thinking. What was true in formal logic tended to be absorbed in the correlationist theories.

Those formal logicians of the Kantian kind, then, may be summarily dismissed, though their undertaking was a necessary one, who failed to raise the epistemological issue at all, or who, raising it, acquiesced in a naïve dualism agnostic of the real world as Kant’s essential lesson. They failed to develop any view which could serve either in fact or in theory as a corrective to the effect of their formalism. What they said with justice was said as well or better elsewhere.

Among them it is on the whole impossible not to include the names of Hamilton and Mansel. The former, while his erudition in respect to the history of philosophical opinion has rarely been equalled, was not a clear thinker. His general theory of knowledge deriving from Kant and Reid, and including among other things a contaminatio of their theories of perception,3 in no way sustains or mitigates his narrow view of logic. He makes no effective use of his general formula that to think is to condition. He appeals to the direct testimony of consciousness in the sense in which the appeal involves a fallacy. He accepts an ultimate antimony as to the finiteness or infinitiy of "the unconditioned," yet applies the law of the excluded middle to insist that one of the two alternatives must be true, wherefore we must make the choice. And what is to be said of the judgment of a writer who considers the relativity of thought demonstrated by the fact that every judgment unites two members? Hamilton’s significance for the history of logic lies in the stimulus that he gave to the development of symbolic logic in England by his new analytic based upon his discovery or adoption of the principle of the quantification of the predicate. Mansel, too, was learned, specially in matters of Aristotelian exegesis, and much that of value lies buried in his commentary of the dry bones of the Artis Logicae Rudiments of Locke’s contemporary Aldrich. And he was a clearer thinker than Hamilton. Formal logic of the extremest rigour is nowhere to be found more adequately expressed in all its strength, and it must be added in all its weakness, than in the writings of Mansel. But if the view maintained above that formal logic must compromise or mitigate its rigour and so fail to maintain its independence, be correct, the logical consistency of Mansel’s logic of consistency does but emphasize its barrenness. It contains no germ for further development.

The brief logic of Herbart4 is altogether formal too. Logical forms have for him neither psychological nor metaphysical reference. We are concerned in logic solely with the systemic

1 See Sir William Hamilton: The Philosophy of Perception, by J. Hutchinson Stirling.

2 Die Logik, insbesondere die Analytik (Schleswig, 1825). August Dettig, Christian Tewson (1790-1876), a Prost-theologian, succeeded Schleiermacher as professor in Berlin in 1835.
clarification of concepts which are wholly abstract, so that they are not merely not ultimate realities, but also in no sense actual moments of our concrete thinking. The first task of logic is to distinguish and group such concepts according to their marks, and from their classification there naturally follows their connexion in judgment. It is in the logic of judgment that Herbert inaugurates a new era. He is not, of course, the first to note that even categorical judgments do not assert the realization of their subject. That is a thought which lies very near the surface for formal logic. He had been preceded too by Macon in the attempt at a reduction of the traditional types of judgment. He was, however, the first whose analysis was sufficiently convincing to exercise the tyranny of grammatical forms. The categorical and disjunctive judgment reduce to the hypothetical. By means of the doctrine of the quantification of the predicate, in which with his Leibnitzian conception of identity he anticipated Beneke and Hamilton alike, universal and particular judgments are made to pull together. Modal, impersonal, existential judgments are all accounted for. Only the distinction of affirmative and negative judgments remains unresolved, and the exception is a natural one from the point of view of a philosophy of pluralism. There was little left to be done here save in the way of an inevitable mutatis mutandis, even by Lotze and F. H. Bradley. From the judgment viewed as hypothetical we pass by affirmation of the antecedent or denial of the consequent to inference. This point of departure is noteworthy, as also is the treatment of the inductive syllogism as one in which the middle term is resoluble into a group or series (Reibe). In indicating specifically, too, the case of conclusion from a copulative major premise with a disjunctive minor, Herbert seems to have suggested the cue for Sigwart's exposition of Bacon's method of exclusions.

That it was the formal character of Herbert's logic which was ultimately fatal to its acceptance outside the school as an independent system, is suggested by a school of thought which contained one a different footing from that of the formal logic hitherto discussed, and is not to be condemned upon quite the same grounds. In the first place, Herbert is quite aware of the nature of abstraction. In the second, there is no claim that thought at one and the same time imposes form on "the given" and is susceptible of treatment in isolation by logic. With Herbert the forms of common experience, and indeed all that we can regard as his categories, are products of the psychological mechanism and destitute of logical import. And lastly, Herbert's logic conforms to the exigencies of his system as a whole and the principle of the bare or absolute self-identity of the ultimate "reals" in particular.

It is for this reason that it finally lacks real affinity to the "pure logic" of Fries. For at the basis of Herbert's speculation there lies a conception of identity foreign to the thought of Kant with his stress on synthesis, in his thoroughgoing metaphysical use of which Herbert goes back not merely to Wolff but to Leibnitz. It is no mere coincidence that his treatment of all forms of continuance and even his positive metaphysics of "reals" show affinity to Leibnitz. It was in the pressing to its extreme consequences of the conception of uncompromising identity which is to be found in Leibnitz, that the contradictions took their rise which Herbert aimed at solving, by the method of relations and his doctrine of the ultimate plurality of "reals." The logic of relations between conceptual units, themselves unaltered by the relation, seems a kind of reflection of his metaphysical method. To those, of course, for whom the only real identity is identity in difference, while identity without difference, like difference without identity, is simply a limit or a vanishing point, Herbert's logic and metaphysics will alike lack plausibility.

The setting of Herbert's logic in his thought as a whole might of itself perhaps justify separate treatment. His far-reaching influence in the development of later logic must certainly do so. Directly he affected a school of thought which contained one logician of first-rate importance in Moritz Wilhelm Drobisch (1802-1869), professor at Leipzig. In less direct relation stands Lotze, who, although under other influences he developed a different view even in logic, certainly let no point in the doctrine of his great predecessor at Gottingen escape him. A Herbertian strain is to be met with also in the thought of writers much farther afield, for example F. H. Bradley, far though his metaphysics is removed from Herbert's. Herbert's influence is surely to be found too in the evolution of what is called Gegenstandstheorie. Nor did he affect the logic of his successors through his logic alone. Reference has been made above to the effect upon the rise of the later psychological logic produced by Herbert's psychology of apperception, when disengaged from the background of his metaphysics taken in conjunction with his treatment in his practical philosophy of the judgment of value or what he calls the aesthetic judgment. Emerson's verdict upon a greater thinker—that his was "not a mind to nestle in"—may be true of Herbert, but there can be no doubt as to the stimulating force of this master.

The second way of interpreting the antithesis of thought to what is thought of, was taken by a group of thinkers among whom a central and inspiring figure was Schleiermacher. They in no sense constitute a school and manifest radical differences among themselves. They are agreed, however, in the rejection, on the one hand, of the subjectivist logic with its intrinsic implication that knowledge veils rather than reveals the real world, and, on the other hand, of the logic of the speculative construction with its pretension to "deduce," to determine, and finally at once to cancel and conserve any antithesis in its all-embracing dialectic. They agree, then, in a maintenance of the critical point of view, while all alike recognize the necessity of bringing the thought-function in knowledge into more intimate relation with its "other" than Kant had done, by means of some formula of correlation or parallelism. Such an advance might have taken its cue directly from Kant himself. As an historical fact it tended rather to formulate itself as a reaction towards Kant in view of the course taken by the speculative movement. Thus Schleiermacher's system (Die Dichter [1801]) may be characterized as an appeal from the absolutist element in Schelling's philosophy to the conception of that correlation or parallelism which Schelling had exhibited as flowing from and subsisting within his absolute, and therein as a return upon Kant's doctrine of limits. Schleiermacher's conception of dialectic is to the effect that it is concerned with the principles of the art of philosophizing, as these are susceptible of a relatively independent treatment by a permissible abstraction. Pure thinking or philosophizing is with a view to knowledge or knowledge as an interconnected system of all sciences or部门al forms of knowledge, the mark of knowledge being its identity for all thinking minds. Dialectic then investigates the nexus which must be held to obtain between all thoughts, but also that agreement with the nexus in being which is the condition of the validity of the thought-nexus. In knowing there are two functions involved, the "organic" or animal function of sensuous experience in virtue of which we are in touch with being, directly in inner perception, mediately in outer experience, and the "intellectual" function of construction. Either is indispensible, though in different departments of knowledge the predominant role falls to one or other, e.g. we are more dependent in physics, less so in ethics. The idea of a perfect harmony of thinking and being is a presupposition that underlies all knowing but cannot itself be realized in knowledge. In terms of the agreement of thought and being, the logical forms of the part of dialectic correspondent to knowledge statically considered have parallels and analogies in being, the concept being correlated to substance, the judgment to causal nexus. Inference, curiously enough, falls under the technical side of dialectic concerned with knowledge in process or becoming, a line of cleavage which Neuberg has rightly characterized as constituting a rift within Schleiermacher's parallelism. Schleiermacher's formula obviously answers to a function in knowledge to thought as such, and describes in a suggestive manner a duality of the intellectual and organic functions, resting on a parallelism of thought and being whose collapse into identity it is beyond human capacity to grasp. It is rather,
however, a statement of a way in which the relations of the terms of the problem may be conceived as a system of necessity. It may indeed be permitted to doubt whether its influence upon subsequent theory would have been a great one apart from the spiritual force of Schleiermacher's personality. Some sort of correlationist conception, however, was an inevitable development, and the list of those who accepted it in something of the spirit of Schleiermacher is a long one and contains many distinguished names, notably those of Trendelenburg and Ueberweg.

The group is loosely constituted however. There was scope for diversity of view and there was diversity of view, according to the vital issue of the formula was held to lie in the relation of intellectual function to organic function or in the not quite equivalent relation of thinking to being. Moreover, few of the writers who, whatsoever it was that they baptized with the name of logic, were at least earnestly engaged in an endeavour to solve the problem of knowledge within a circle of ideas which was on the whole maintained under the process of a simulation. Bennche's philosophy is a striking instance of this, with application to Fries and affinity to Herbert conjoined with obligations to Schelling both directly and through Schleiermacher. Lotze again wove together many threads of earlier thought, though the web was assuredly his own. Finally it must not be forgotten that the host of writers who were in reaction against Hegelianism tended to take refuge in some formula of correlation, as a half-way house between that and formalism or psychologism or both, without reference to, and often perhaps without consciousness of, the way in which historically it had taken shape to meet the problem held to have been left unresolved by Kant.

Lotze on the one hand held the Hegelian "deduction" to be untenable, and classed himself with those who in his own phrase was "passing to the order of the day," while on the other hand he definitely raised the question, how an "object" could be brought into forms to which it was not in some sense adapted. Accordingly, though he regards logic as formal, its forms come into relation to objectivity in some sort even within the logical field itself, while when taken in the setting of his system as a whole, its formal character is not of a kind that ultimately excludes psychological and metaphysical reference, at least speculatively. As a logician Lotze stands among the masters. His flair for the essentials in his problem, his subtlety of analysis, his patient willingness to return upon a difficulty from a fresh and still a fresh point of view, and finally his fineness of judgment, make his logic so essentially logic of the present, and of its kind not soon to be superseded, that nothing more than an indication of the historical significance of some of its characteristic features need be attempted here.

In Lotze's pure logic it is the Herbartian element that tends to be disconcerting. Logic is formal. Its unit, the logical concept, is a manifold, under the process of manipulation may be called abstraction. Processes of the psychological mechanism lie below it. The paradox of the theory of judgment is due to the ideal of identity, and the way in which this is evaded by supplementation to produce a non-judgmental identity, followed by translation of the introduced accessories with conditions in the hypothetical judgment, is thoroughly in Herbart's manner. The reduction of judgments is on lines already familiar. Syllogism is no instrumental method by which we compose our knowledge, but an ideal to the form of which it should be brought. It is, as it were, a schedule to be filled in, and is connected with the disjunctive judgment as a schematic setting forth of alternatives, not with the hypothetical, and ultimately the apodictic judgment with their suggestion that it is the real movement of thought that is subjected to analysis. Yet the resultant impression left by the whole treatment is not Herbartian. The concept is accounted for in Kantian terms. There is no discontinuity between the pre-logical or sub-logical conversion of impressions into "first universals" and the formation of the logical concept. Abstraction proves to be synthesis with compensatory universal marks in the place of the particular marks abstracted from. Synthesis as the work of thought always supplies, beside the mere conjunction or disjunction of ideas, a ground of their coherence or non-coherence. It is evident that thought, even as dealt with in pure logic, has an objectifying function. Its universals have objective validity, though this does not involve direct real reference. The formal conception of pure logic, then, is modified by Lotze in such a way as not only to be compatible with a view of the structural and functional adequacy of thought to that which at every point at which we take thinking is still distinguishable from thought, but even inevitably to suggest it. That the unit for logic is the concept and not the judgment has proved a stumbling-block to those of Lotze's critics who are accustomed to think in terms of the act of thought as unit. Lotze's procedure is, indeed, analogous to an operation in his philosophy of nature, he starts from a plurality of real beings, but by means of a reductive movement, an application of Kant's transcendental method, arrives at the postulate or fact of a law of their reciprocal action which calls for a monistic and idealist interpretation. He starts, that is in logic, with conceptual units apparently self-contained and admitting of nothing but external relation, but proceeds to justify the intrinsic relation between the matter of his units by an appeal to the fact of the coherence of all contents of thought. Indeed, if thought admits irreducible units, what can unite? Yet he is left committed to his puzzle as to a reduction of judgment to identity, which partially vitiates his treatment of the theory of judgment. The outstanding feature of this is, nevertheless, not affected, viz. the attempt that he makes, inspired clearly by Hegel, "to develop the various forms of judgment systematically as members of a series of operations, each of which leaves a part of its problem unmastered and starts, in the second place, to develop the problem of the first, but finally completes the judgment as the whole of the articulation of the universe of discourse, as it is for complete knowledge, when its disjunctions have been thoroughly followed out and it is exhaustively determined, carried the day with him against the view that the organon for gaining knowledge is syllogism. The Aristotelian formula is merely the expression, formally expanded and complete, of the truth already embodied in disjunctive judgment, namely, that every S which is a specific form of M possesses as its predicate a particular modification of each of the universal predicates of M to the exclusion of the rest." Schleiermacher's separation of inference from judgment and his attribution of the power to knowledge in process cannot find acceptance with Lotze. The psychologist and the formal logician do indeed join hands in the denial of a real movement of thought in syllogism. Lotze's logic then, is formal in a sense in which a logic which does not find the conception of synthetic truth embarrassing is not so. It is canon and not organon. In the one case, however, where it recognizes what is truly synthesis, i.e. in its account of the concept, it brings the statics of knowledge, so to speak, into integral relation with the dynamics. And throughout, wherever the survival from 1843, the identity bug-bear, is for the moment got rid of in what is really a more liberal conception, the statical doctrine is developed in a brilliant and informing manner. Yet it is in the detail of his logical investigations, something too volatile to fix in summary, that Lotze's greatness as a logician more especially lies.

With Lotze the ideal that at last the forms of thought shall be realized to be adequate to that which at any stage of actual knowledge always proves relatively intractable is an illuminating projection of faith. He takes courage from the reflection that to accept scepticism is to presume the competence of the thought that accepts. He will, however, take no easy way of parallelism. Our human thought pursues devious and circuitous methods. Its forms are not unsel'd scaffolding for the house for knowledge rather than the framework of the house itself. Our task is not to realise correspondence with something other than thought,
but to make explicit those justificatory notions which condition the form of our apprehension. "However much we may press upon an original reference of the forms of thought to that nature of things which is the goal of knowledge, we must be prepared to find in them many elements which do not directly reproduce the actual reality to the knowledge of which they are to lead us."

The impulse of thought to reduce coincidence to coherence reaches immediately only to objectivity or validity. The sense in which the presupposition of a further reference is to be interpreted and in which justificatory notions for it can be adduced is only determinable in a philosophic system as a whole, where feeling has a place as well as thought, value equally with validity.

Lotze's logic then represents the statical aspect of the function of thought in knowledge, while, so far as we go in knowledge thought is always engaged in the unification of a manifold, which remains contradistinguished from it, though not, of course, completely alien to and unadapted to it. The further step to the determination of the ground of harmony is not to be taken in logic, where limits are present and untranscended.

The position of the search for truth, for which knowledge is a growing organism in which thought needs so to speak, feed upon it, is considered in the post-Kantian period by antagonism to the speculative movement which culminated in the dialectic of Hegel.

The radical thought of this movement was voiced in the demand of Reinhold\(^2\) that philosophy should "deduce" it all from a single principle and by a single method. Kant's limits that must needs be thought and yet cannot be thought must be thought away. An earnest attempt to satisfy this demand was made by Fichte whose single principle was the activity of the pure Ego, while his single method was the assertion of a truth revealed by reflection on the content of conscious experience, the characterization of this as a half truth and the supplementation of it by its other, and finally the harmonization of both. The pure ego is inferred from the fact that the non-ego is realized only in the act of the ego in positing it. The ego posits itself, but reflection on the given shows that we must add that it posits also the non-ego. The two positions are to be reconciled in the thought of reciprocal limitation of the posited ego and non-ego. And so forth. Fichte cannot be said to have developed a logic, but this rhythm of thesis, antithesis and synthesis, foreshadowed in part for Fichte in Spinoza's formula, "omnis determinatio est negatio," and significantly in Kant's triadic grouping of his categories, gave a cue to the thought of Hegel.

Schelling, too, called for a single principle and claimed to have found it in his Absolute, "the night" said Hegel, "in which all cows are black," but his historical influence lay, as we have seen, in the direction of a parallelism within the unity, and he also developed no logic.

It is altogether otherwise with Hegel.

Hegel's logic,\(^3\) though it involves inquiries which custom regards as metaphysical, is not to be characterized as a metaphysics with a method. It is logic or a rationale of thought by thought, with a full development among other matters of all that the most separatist of logicians regards as thought forms. It offers a solution of what has throughout appeared as the logical problem. That solution lies doubtless in the evolution of the Idea, i.e., an all-inclusive in which mere or pure thought is cancelled in its separateness by a transfiguration, while logic is nothing but the science of the Idea viewed in the medium of pure thought. But, whatever else it be, this Panalogism, to use the word of J. E. Erdmann, is at least a logic. Thought in its progressive unfolding, of which the history of philosophy taken in its broad outline offers a pageant, necessarily cannot find anything external to or alien from itself, though that there is something external for it is another matter. As Fichte's Ego finds that its non-ego springs from and has its home within its very self, so with Hegel thought finds itself in its "other," both subsisting in the Idea which is both and neither. Either of the two is the all, as, for example, the law of the convexity of the curve is the law of the curve and the law of its concavity. The process of the development of the Idea or Absolute is in one regard the immanent process of the all. Logically regarded, i.e., "in the medium of mere thought," it is dialectical method. Any abstract and limited point of view carries necessarily to its contradictory. This can only be atoned with the original determination by fresh negation in which a new thought-determination is born, which is yet in a sense the old, though enriched, and valid on a higher plane. The limitations of this in turn cause a contradiction to emerge, and the process needs repetition. At last, however, no swing into the opposite, while, with its primarily conflicting, if ultimately complementary function, is any longer possible. That in which no further contradiction is possible is the absolute Idea. Bare or indeterminate being, for instance, the first of the determinations of Hegel's logic, as the being of that which is not anything determinate, of Kant's thing-in-itself, for example, positively abstract, is impregnated and on this note of not-being which negates it, and is one with it, yet with a difference, so that we have the transition to determinate being, the transition being baptized as becoming. And so forth. It is easy to raise difficulties not only in regard to the detail in Hegel's development of his categories, especially the higher ones, but also in regard to the essential rhythm of his method. The consideration that mere double negation leaves us precisely where we were and not upon a higher plane where the dominant concept is richer, is, of course, fatal only to certain verbal expressions of Hegel's interest. There is a differentiation in type between the two negations. But if we grant this it is no longer obviously the simple logical operation indicated. It is inferred then that Hegel complements from the stuff of experience, and fails to make good the pretension of his method to be by itself and of itself the means of advance to higher and still higher concepts till it can rest in the Absolute. He discards, as it were, and takes in from the stock while professing to play from what he has originally in his hand. He postulates his unity in senses and at stages in which it is inadmissible, and supplies only a schema of relations otherwise won, a view supported by the way in which he injects certain determinations in the process, e.g., the category of chemistry. Has he not cooked the process in the light of the result? In truth the Hegelian logic suffers from the fact that the good to be reached is presupposed in the beginning. Nature, e.g., is not deduced as real because rational, but being real its rationality is presumed and, very imperfectly, exhibited in a way to make it possible to conceive it as in its essence the reflex of Reason. It is a vision rather than a construction. It is a "theosophical logic." Consider the rational-real in the unity that must be, and this is the way of it, or an approximation to the way of it! It was inevitable that the epistemologists of the search for truth would have none of it. The ideal in whatever sense real still needs to be realized. It is from the human standpoint regulative and only hypothetically or formally constitutive. We must not confuse edea with idea, nor even with ideum.

Yet in a less ambitious form the fundamental contents of Hegel's method tend to find a qualified acceptance. In any piece of presumed knowledge its partial or abstract character involves the presence of loose edges which force the conviction of inadequacy and the development of contradictions. Contradictions must be annulled by complementation, with resultant increasing coherence in ascending stages. At each successive stage in our progress fresh contradictions break out, but the ideal of a station at which the thought-process and its other, if not one, are at one, is permissible as a limiting conception. Yet if Hegel meant only this he has indeed succeeded in concealing his meaning.

Hegel's treatment of the categories or thought determinations which arise in the development of the immanent dialectic is rich in flashes of insight, but most of them are in the ordinary

---

1. Logic, Intro. § ix.
view of logic wholly metaphysical. In the stage, however, of his process in which he is concerned with the notion are to be found concept, judgment, syllogism. Of the last he declares that it “is the reasonable and everything reasonable” (Encyk. § 181), and has the panty to speak of the definition of the Absolute as being “at this stage” simply the syllogism. It is, of course, the rhythm of the syllogism that attracts him. The concept goes out from or utters itself in judgment to return to an enhanced unity in syllogism. Ueberweg (System § 101) is, on the whole, justified in exclaiming that Hegel’s rehabilitation of syllogism “did but slight service to the Aristotelian theory of syllogism,” yet his treatment of syllogism must be regarded as an acute contribution to logical criticism in the technical sense. He insists on its objectivity. The transition from judgment is not brought about by our subjective action. The syllogism of “allness” is convicted of a peitio principii (Encyk. § 190), with consequent lapse into the inductive syllogism, and, finally, since inductive syllogism is involved in the infinite process, into analogy. “The syllogism of necessity,” on the contrary, does not presuppose its conclusion in its premises. The detail, too, of the whole discussion is rich in suggestion, and subsequent logicians—Ueberweg himself perhaps, Lotze certainly in his genetic scale of types of judgment and inference, Professor Bosanquet notably in his systematic development of “the morphology of knowledge,” and others—have with reason exploited it.

Hegel’s logic as a whole, however, stands and falls not with his thoughts on syllogism, but with the claim made for the dialectical method that it exhibits logic in its integral unity with metaphysic, the thought-process as the self-revelation of the Idea. The claim was disallowed. To the formalist proper it was self-condemned in its pretension to develop the content of thought and its rejection of the formula of bare-identity. To the epistemologist it seemed to confuse foundation and keystone, and to suppose itself to build upon the latter in a construction illegitimately adjectival, of materials otherwise accumulated. At most it was thought to establish a schema of formal unity which might serve as a regulative ideal. To the methodologist of science in its genesis it appeared altogether to fail to satisfy any practical interest. Finally, to the psychologist it spelt the failure of intellectualism, and encouraged, therefore, some form of rehabilitated experientialism.

In the Hegelian school in the narrower sense the logic of the master receives some exegesis and defence upon single points of doctrine rather than as a whole. Its effect upon logic is rather to be seen in the rethinking of the traditional body of logical doctrine in the light of an absolute presupposed as ideal, with the postulate that a regulative ideal must ultimately exhibit itself as constitutive, the justification of the postulate being held to lie in the coherence and all-inclusiveness of the result. In such a logic, if and so far as coherence should be attained, would be found something akin to the spirit of what Hegel achieves, though doubtless alien to the letter of what it is his pretension to have achieved. There is perhaps no serious misrepresentation involved in regarding a key-thought of this type, though not necessarily expressed in those verbal forms, as pervading such logic of the present as coheres with a philosophy of the absolute conceived from a point of view that is intellectualist throughout. All other contemporary movements may be said to be in revolt from Hegel.

v. Logic from 1880–1910

Logic in the present exhibits, though in characteristically modified shapes, all the main types that have been found in its past history. There is an intellectualist logic coalescent with an absolutist metaphysic as aforesaid. There is an epistemological logic with sometimes formalist, sometimes methodological leanings. There is a formal-symbolic logic engaged with the elaboration of a relational calculus. Finally, there is what may be termed psychological-voluntarist logic. It is in the rapidity of development of logical investigations of the third and fourth types and the growing number of their exponents that the present shows most clearly the history of logic in the making. All these

movements are logic of the present, and a very brief indication may be added of points of historical significance.

Of intellectualist logic Francis Herbert Bradley1 (b. 1846) and Bernard Bosanquet2 (1848) may be taken as typical exponents. The philosophy of the former concludes to an Absolute by the annulment of contradictions, though the ladder of Hegel is conspicuous by its absence. His metaphysical method, however, is like Herbert’s, not identifiable with his logic, and the latter has for its central characteristic its thorough restatement of the logical forms traditional in language and the text-books, in such a way as to harmonize with the doctrine of a reality whose organic unity is all-inclusive. The thorough recasting that this involves, even of the thought of the masters when it occasionally echoes them, has resulted in a phrasing uncouth to the ear of the plain man with his world of persons and things in which the former simply think about the latter, but it is fundamentally necessary for Bradley’s purpose. The negative judgment, for example, cannot be held in one and the same univocal act to presuppose the unity of the real, project an absolute as conceivably applicable to it and assert its rejection. We need, therefore, a restatement of it. With Bradley reality is the one subject of all judgment immediate or mediate. The act of judgment “which refers an ideal content (recognized as such) to a reality beyond the act” is the unit for logic. Grammatical subject and predicate necessarily both fall under the rubric of the adjectival, that is, within the logical idea or ideal content asserted. This is a meaning or universal, which can have no detached or abstract self-subsistence. As found in judgment it may exhibit differences within itself, but it is not two, but one, an articulation of unity, not a fusion, which could only be a confusion, of differences. With a brilliant subtlety Bradley analyses the various types of judgment in his own way, with results that must be taken into account by all subsequent logicians of this type. The view of inference with which he complements it is only less satisfactory, because of a failure to distinguish the principle of nexus in syllogism from its traditional formulation and rules, and because he is hampered by the intractability which he finds in certain forms of relational construction.

Bosanquet had the advantage that his logic was a work of a slightly later date. He is, perhaps, more able than Bradley has shown himself, to use material from alien sources and to penetrate to what is of value in the thought of writers from whom, whether on the whole or on particular issues, he disagrees. He treats the book-tradition, however, a debt to which, nowadays inevitable, he is generous in acknowledging, with a judicious exercise of freedom in adaptation, i.e. constructively as datum, never eclectically. In his fundamental theory of judgment his obligation is to Bradley. It is to Lotze, however, that he owes most in the characteristic feature of his logic, viz., the systematic development of the types of judgment, and inference from less adequate to more adequate forms. His fundamental continuity with Bradley may be illustrated by his definition of inference.

“Inference is the indirect reference to reality of differences within a universal, by means of the exhibition of this universal in differences directly referred to reality.” Bosanquet’s Logic will long retain its place as an authoritative exposition of logic of this type.

Of epistemological logic in one sense of the phrase Lotze is still to be regarded as a typical exponent. Of another type Chr. Sigwart (q.v.) may be named as representative. Sigwart’s aim was “to reconstruct logic from the point of view of methodology.” His problem was the claim to arrive at propositions universally valid, and so true of the object, whosoever the individual thinker. His solution, within the Kantian circle of ideas, was that such principles as the Kantian principle of causality were just and postulates of the endeavour after complete knowledge. “What Kant has shown is not that irregular fleeting changes can never be the object of consciousness, but only that the ideal consciousness of complete science would

3 Logic, Pref. pp. 6 seq. 1d. vol. ii. p. 4.
be impossible without the knowledge of the necessity of all events. The universal presuppositions which form the outline of our ideal of knowledge are not so much laws which the understanding prescribes to nature... as laws which the understanding lays down for its own regulation in its investigation and consideration of nature. They are a priori because no experience is sufficient to reveal or confirm them in unconditional universality; but they are a priori... only in the sense of presuppositions without which we should work with no hope of success and merely at random and which therefore we must believe. Finally they are akin to our ethical principles. With this Sigwart with Lotze is instructive, in regard both to their agreement and their divergence as showing the range of the epistemological formula.

Of the formal-symbolic logic all that falls to be said here is, that from the point of view of logic as a whole, it is to be regarded as a legitimate praxis as long as it shows itself aware of the sense in which alone form is susceptible of abstraction, and is aware that in itself it offers no solution of the logical problem. "It is not an algebra," said Kant of his technical logic, and the kind of support lent recently to symbolic logic by the Gegenstandstheorie identified with the name of Alexius Meinong (b. 1853) is qualified by the warning that the real activity of thought tends to fall outside the calculus of relations and to attach rather to the subsidiary function of denoting. The future of symbolic logic as coherent with the rest of logic, in the sense which the word has borne throughout its history seems to be bound up with the question of the nature of the analysis that lies behind the symbolism, and of the way in which this is justified in the setting of a doctrine of validity. The "theory of the object," itself, while affecting logic alike in the formal and in the psychological conception of it very deeply, does not claim to be regarded as logic of a logic, apart from a setting supplied from elsewhere.

Finally we have a logic of a type fundamentally psychological, if it be not more properly characterized as a psychology which claims to be the whole of philosophy, including the logic of the field. The general and organizing principle of this is that knowledge is in genesis, that the genesis takes place in the medium of individual minds, and that this fact implies that there is a necessary reference throughout to interests or purposes of the subject which thinks because it wills and acts. Historically this doctrine was formulated as the declaration of independence of the 'sins of the root against the pretensions of absolutist logic. It drew for support upon the psychological movement that begins with Fries and Herbert. It has been chiefly indebted to writers, who were not, or were not primarily, logicians, to Avenarius, for example, for the law of the economy of thought, "of Wundt, who system, and therewith his logic, is a pendant to his psychology, for the volitional character of judgment, to Herbert Spencer and others. A judgment is practical, and not to be divorced without improper abstraction from the purpose and will that informs it. A concept is instrumental to an end beyond itself, without any validity other than its value for action. A situation involving a need of adaptation to environment arises and the problem it sets must be solved that the will may control environment and be justified by success. Truth is the improved machinery that is interjected, so far as it works. It is clear that we are in the presence of what is at least an important half-truth, which intellectualism with its statics of the rational order viewed as a completely articulate system has tended to ignore. It throws light on many phases of the search for truth, upon the plain man's claim to start with a subject which he knows whose predicate which he does not know is still to be developed, or again upon his use of the negative form of judgment, when the further determination of his purposive system is served by a positive judgment from without, the positive content of which is yet to be dropped as irrelevant to the matter in hand. The movement has, however, scarcely developed its logic except as polemic. What seems clear is that it cannot be the whole solution. While man must confront nature from the human and largely the practical standpoint, yet his control is achieved only by the increasing recognition of objective controls. He conquers by obedience to truth, works, and is economical because it is truth. Working is proportioned to inner coherence. It is well that the view should be developed into all its consequences. The result will be to limit it, though perhaps also to justify it, save in its claim to reign alone.

There is, perhaps, an increasing tendency to recognize that the organism of knowledge is a thing which from any single viewpoint must be seen in perspective. It is of course a postulate that all truths harmonize, but to give the harmonious whole in a projection in one plane is an undertaking whose adequacy in one sense involves an inadequacy in another. No human architect can hope to take up in succession all essential points in view in regard to the form of knowledge or to logic. "The great campaign is still to finish."

BIBLIOGRAPHY.—Historical: No complete history of logic in the sense in which it is to be distinguished from theoretical philosophy in general has as yet been written. The history of logic is indeed so little intelligible apart from constant reference to tendencies in philosophical development as a whole, that the historian, when he has made the requisite preparatory studies, inclines to essay the more ambitious task. Yet there are, of course, works devoted to the history of logic proper.

Of these Panm's Geschichte der Logik im Abendlande (4 vols., 1855-1870), which traces the rise, development and fortunes of the Aristotelian logic to the close of the middle ages, is monumental. Next in importance are the works of L. Raus, Logik und Methodik, i. (1869) pp. 123-242, historical, pp. 453-518 bibliographical, pp. 514 sqq. a section on apparatus for the study of the history of logic), Die neuesten Bestrebungen auf dem Gebiete der Logik bei den Deutschen (1880, 1885), Logik und Methodik im System der Logik und Geschichte der logischen Lehren in 4th ed. and last revised by the author, 1874, though it has been reissued later, Eng. trans., 1871 is alone to be named with these. Harms' Pointu, Geschichte der Logik und Methodik in der Deutschen Geschichte der Logik und Methodik in der Geschichte der Logik und Methodik (1838) is the chief French contribution to the subject as a whole.

Of contributions towards the history of special periods or schools of logical thought the list, from the opening chapters of Raus's Scholiaris Dialectica (1590) downwards (v. Raus's loc. cit. in the field), could be endless. What is of value in the earlier works has now been absorbed. The System der Logik (1828) of Bachmann (a Kantian logic of distinction) contains a historical survey (pp. 569-644), and the present (5th ed.) by (in the 1st ed. by von Baader) is the starting point of the history (pp. 451, 517 sqq.). Eberstein's Geschichte der Logik und Methodik bei den Deutschen von Leibniz bis auf gegenwartige Zeit (latest edition, 1879), is still of importance in regard to logicians of the school of Wolff and the origin of Kant's logical thought. Hofmann, the editor and disciple of von Baader, published Grundzüge einer Geschichte der der Kosmologie der Logik in Deutschland (1923), in which is a study of the history of philosophy and terminology, as well as the theory. Röhl's article entitled Logik in Die Kultur der Gegenwart, i. 1, Systematische Philosophie (1907), is excellent, and touches on quite modern developments. Venn's Symbolic Logic (1881) gives a careful history and bibliography of the development of the modern formal logic is as yet to be found only in the form of unshaped material in the pages of review and Jahresbericht.

LOGOCYCLIC CURVE—LOGOS

LOGOCYCLIC CURVE, STROPHOID or FOLIATE, a cubic curve generated by increasing or diminishing the radius vector of a variable point Q on a straight line AB by the distance QC of the point from the foot of the perpendicular drawn from the origin to the fixed line. The polar equation is
$$r = a(1 \pm \sin \theta)$$
the upper sign referring to the case when the vector is increased, the lower when it is diminished. Both branches are included in the Cartesian equation
$$(x^2+y^2)(2a-x) = a^2x, \quad \text{where } a \text{ is the distance of the line from the origin.}$$
If we take for axes the fixed line and the perpendicular through the initial point, the equation takes the form
$$y \sqrt{(a-x)} = x \sqrt{(a+x)}. \quad \text{The curve resembles the folium of Descartes, and has a node between } x = a, \quad x = -a, \text{and two branches asymptotic to the line } x = 2a.$$  

LOGOGRAPH (Λογογραφος, Logographos, writers of prose histories or tales), the name given by modern scholars to the Greek historiographers before Herodotus.1 Thucydides, however, applies the term to his own predecessors, and it is therefore useful to make a distinction between the older and the younger logographers. Their representatives, with one exception, came from Ionia and its islands, which from their position were most favourably situated for the acquisition of knowledge concerning the distant countries of East and West. They wrote in the Ionic dialect, in what was called the unperiodic style, and preserved the poetic character of their epic model. Their criticism amounts to nothing more than a crude attempt to rationalize the current legends and traditions connected with the founding of cities, the genealogies of ruling families, and the manners and customs of individual peoples. Of scientific criticism there is no trace whatever. The first of these historians was probably Cadmus of Milletus (who lived, if at all, in the early part of the 6th century), the earliest writer of prose, author of a work on the founding of his native city and the colonization of Ionia (so Suidas); Pherecydes of Leros, who died about 400, is generally considered the last. Mention may also be made of the following: Hecataeus of Milletus (550–476); Acusilas of Argos,2 who paraphrased in prose (correcting the tradition where it seemed necessary) the genealogical works of Hesiod in the Ionic dialect; he confined his attention to the prehistoric period, and made no attempt at a real history; Charon of Lampascus (c. 450), author of histories of Persia, Libya, and Ethiopia, of annals (Εποικία) of his native town with lists of the tyrants and archons, and of the chronicles of Lacedaemonian kings; Xanthus of Sardis in Lydia (c. 450), author of a history of Lydia, one of the chief authorities used by Nicolaus of Damascus (β, during the time of Augustus); Hellanicus of Mytilene; Stesimbratus of Thasos, opponent of Pericles and reputed author of a political pamphlet on Themistocles, Thucydidest and Pericles; Hippys and Glaucus, both of Rhgium, the first of the authors of histories of Italy and Sicily, the second of a treatise on ancient poets and musicians, used by Harpocration and Plutarch; Damastes of Sigeum, pupil of Hellanicus, author of genealogies of the combatants before Troy (an ethnographic and statistical list), of short treatises on poets, sophists, and geographical subjects. On the early Greek historians, see G. Busolt, Griechische Geschichte (1893), i. 137–155; C. Wachsmuth, Einleitung in das Studium der altb. Geschich. (1884); A. Seel, Geschichte der griechischen und rom. Geschichte (ed. H. Nissen, 1889); J. B. Bury, Ancient Greek Historians (1909), lecture i.; histories of Greek literature by Müller-Donaldson (ch. 18) and W. Mure (bk iv. ch. 3), where the little that is known concerning the life and writings of the logographers is exhaustively discussed. The fragments will be found, with Latin notes, translation, prolegomena, and copious indexes, in C. W. Müller’s Fragmenta historiorum Graecorum (1841–1870).

See also GREECE: History, Ancient (section “Authorities”).

LOGOS (Λογος), a common term in ancient philosophy and theology. It expresses the idea of an immanent reason in the world, and, under various modifications, is met with in Indian, Egyptian and Persian systems of thought. But the idea was developed mainly in Hellenic and Hebrew philosophy, and we may distinguish the following stages:

1. The Hellenic Logos.—To the Greek mind, which saw in the world a λόγος (ordered whole), it was natural to regard the world as the product of reason, and reason as the ruling principle in the world. So we find a Logos doctrine more or less prominent from the dawn of Hellenic thought to its eclipse. It rises in the realm of physical speculation, passes over into the territory of ethics and theology, and makes its way through at least three well-defined stages. These are marked off by the names of Heraclitus of Ephesus, the Stoics and Philo.

It acquires its first importance in the theories of Heraclitus (6th century b.c.), who, trying to account for the aesthetic order of the visible universe, broke away from some extent from the purely physical conceptions of his predecessors and discerned at work in the cosmic process a λόγος analogous to the reasoning power in man. On the one hand the Logos is identified with γνώμη and connected with διήκ, which latter seems to have the function of correcting deviations from the eternal law that rules in things. On the other hand it is not positively distinguished either from the ethereal fire, or from the ειμί (which all things are), and holds that nothing material can be thought of without this Logos, but he does not conceive the Logos itself to be immaterial. Whether it is regarded as in any sense possessed of intelligence and consciousness is a question variously answered. But there is most to say for the negative. This Logos is not one above the world or prior to it, but in the world and inseparable from it. Man's soul is a part of it. It is relation, therefore, as Schleiermacher expresses it, or reason, not speech or word. And it is objective, not subjective, reason. Like a law of nature, objective in the world, it gives order and regularity to the movement of things, and makes the system rational.3 The failure of Heraclitus to free himself entirely from the physical hypotheses of earlier times prevents his speculation from influencing his successors. With Anaxagoras a conception entered which gradually triumphed over that of Heraclitus, namely, the conception of a supreme, intellectual principle, not identified with the world but independent of it. This, however, was νοει, not Logos. In the Platonic and Aristotelian systems, too, the theory of ideas involved an absolute separation between the material world and the world of higher reality, and though the term Logos is found the conception is vague and undeveloped. With Plato the term selected for the expression of the principle to which the order visible in the universe is due is νοει or σοφία, not λόγος. It is in the pseudo-Platonic Ethipomis that λόγος appears as a synonym for νοει. In Aristotle, again, the principle which sets all nature under the rule of thought, and determines it towards a rational end, is νοει, or the divine spirit itself; while λόγος is a term with many senses, used as more or less identical with a number of phrases, ον ένεικα, ένοηγία, ένθέλεσα, ονθία, εποιτία, μερτα, &c.

In the reaction from Platonic dualism, however, the Logos doctrine reappears in great breadth. It is a capital element in the system of the Stoics. With their teleological views of the world they naturally predicated an active principle pervading it and determining it. This operative principle is called both Logos and God. It is conceived of as material, and is described in terms used equally of nature and of God. There is at the same time the special doctrine of the λόγος σπερματικός, the seminal Logos, or the law of generation in the world, the principle of the active reason working in dead matter. This part into λόγοι σπιτικοί, which are akin, not to the Platonic ideas, but rather to the λόγος θεού of Aristotle. In man, too, there is a Logos which is his characteristic possession, and which is ἀνασκόλος, as long as it is a thought resident within his breast,

1. Cf. Schleiermacher's Herakleitos der Dunkel; art. HERAKLEITOS and authorities there quoted.
but ἀρνηθησάμενος when it is expressed as a word. This distinction
between Logos as ratio and Logos as oratio, so much used sub-
sequently by Philo and the Christian fathers, had been so far
anticipated by Aristotle's distinction between the ἔργον λόγος and
the θεὸς ἐν τῷ γνώσει. It forms the point of attachment by which
the Logos doctrine connected itself with Christianity. The Logos
of the Stoics (q.v.) is a reason in the world gifted with intelligence,
and analogous to the reason in man.

2. The Hebrew Logos.—In the later Judaism the earlier
anthropomorphic conception of God and with it the sense of
the divine nearness had been succeeded by a belief which placed
God at a remote distance, severed from man and the world by
a deep chasm. The old familiar name Yahweh became a secret;
it was not taken by such general expressions as the Holy, the
Almighty, the Majesty on High, the King of Kings, and also
by the simple word “Heaven.” Instead of the once powerful
confidence in the immediate presence of God there grew up a
mass of speculation regarding on the one hand and the distant past
on the other the distant past. Various attempts were made to
bridge the gulf between God and man, including the angels, and
a number of other hybrid forms of which it is hard to say whether
they are personal beings or abstractions. The Wisdom, the
Shekinah or Glory, and the Spirit of God are intermediate
beings of this kind, and even the Law came to be regarded as an
independent spiritual entity. Among these conceptions that
of the Word of God had an important place, especially the
creative Word of Genesis i. Here in the other cases we cannot
always say whether the Word is regarded as a mere attribute or
activity of God, or an independent being, though there is a clear
tendency towards the latter. The ambiguity lies in the twofold
purpose of these activities: (1) to establish communication with
God; (2) to prevent direct connexion between God and the world.
The word of the God of revelation is represented as the creative
principle (e.g. Gen. i. 3; Psalm xxxii. 6), as the executor of the
activity of God, the Psalms of David are possessed of almost personal qualities (Isaiah lv. 11; Psalm
xxxvi. 15). Along with this comes the doctrine of the angel of
Yahweh, the angel of the covenant, the angel of the presence,
in whom God manifests Himself, and who is sometimes identified
with Yahweh or Elohim (Gen. xvi. 11, 13; xxii. 29-31; Exod.
iii. 2; xiii. 21), sometimes distinguished from Him (Gen. xxii.
15, &c.; xxiv. 7; xxviii. 12, &c.), and sometimes presented
in both aspects (Judges ii. 1; Zech. i.). To this must be
added the doctrine of Wisdom, given in the books of Job and
Proverbs. At one time it is exhibited as an attribute of God
(Prov. iii. 19). At another it is strongly personified, so as to
become rather the creative thought of God than a quality (Prov.
vi. 22). Again it is described as proceeding from God as the
principle of creation and objective to Him. In these and
kindred passages (Job xv. 7, &c.) it is on the way to become
hypostatized.

The Hebrew conception is partially associated with the Greek
in the case of Aristobulus, the predecessor of Philo, and, according
to the fathers, the founder of the Alexandrian school. He speaks of Wisdom as theagent of the Book of
prophetic-Solomonic Book of Wisdom (generally supposed to be the
work of an Alexandrian flourishing somewhere between Aristobulus and Philo) deals both with the Wisdom and with the Logos. It
fails to hypostatize either. But it represents the former as the
manifestation or implementation of God, and the latter as the
power or the mind of God. Thus the relationship is made
physic, the intellectual, and the ethical domain, and
apparently objectively to God. In the Targums, on the other hand, the three
doctrines of the word, the angel, and the wisdom of God converge in
a very definite conception. But there there is no personal existence of the Jewish theology God is represented as purely transcendent, having no likeness of nature with
man, and making no personal entrance into history. Instead of the immediate relation of God to the world the Targums introduce the
mediator, as it were, the Shekhinah (real presence). This Memra (= Ma'amá) or, as it is also designated, Dibburiá, is a
hypostasis that takes the place of God when direct intercourse
with man is in view. In all those passages of the Old Testament where
aphorisms are used for God He is represented as the Memra for God. The Memra proceeds from God, and retains the creaturely
relation to God. It does not seem to have been identified with the
Messiah.

3. Philo.—In the Alexandrian philosophy, as represented by
the Hellenized Jew Philo, the Logos doctrine assumes a leading
place and shapes a new career for itself. Philo's doctrine is moulded by three forces—Platonism, Stoicism and Hebraism.
He detaches the Logos idea from its connexion with Stoic
materialism and attaches it to a thorough-going Platonism.
It is Plato's idea of the Good regarded as creatively active.
Hence, instead of being merely immanent in the Cosmos, it has
an independent existence. Platonistic too is the doctrine of the
divine architect who seeks to realize in the visible universe
the archetypes already formed in his mind. Philo was thus
able to make the Logos theory a bridge between Judaism and
Greek philosophy. It preserved the monothetic idea yet
afforded a description of the Divine activity in terms of Hellenic
thought; the Word of the Old Testament is one with the ἀγαθὸς
of the Stoics. And thus in Philo's conception the Logos is much
more than "the principle of reason, informing the infinite
and giving being to the Temporal; it is also
the divine dynamic, the energy and self-revelation of God.
The Stoics indeed sought, more or less consciously, by their
document of the Logos as the Infinite Reason to escape from
the belief in a divine Creator, but Philo, Jew to the core, starts
from the Jewish belief in a supreme, self-existing God, to whom
the reason of the world must be subordinated though related.
The conflict of the two conceptions (the Greek and the Hebrew)
led him into some difficulty; sometimes he represents the Logos
as an independent and even personal being, a "second God,"
sometimes as merely an aspect of the divine activity. And
though passages of the first class must no doubt be explained
figuratively—for Philo would not assert the existence of two
Divine agents—it remains true that the two conceptions cannot
be fused. The Alexandrian philosopher wavers between the
two theories and has to accord to the Logos of Hellenas a semi-
independence position beside the supreme God of Judaism.
He preserves at once the Four Logos (Provolos) of the Twelve
dimensions of God Himself, in some measure to all men, in greater
degree to chosen souls. The appearances recorded in the Old Testament are
manifestations of the Logos, and the knowledge of God possessed
by the great leaders and teachers of Israel is due to the same
source; (2) as the agency whereby man, enmeshed by illusion,
lays hold of the higher spiritual life and rising above his partial
point of view participates in the universal reason. The Logos is thus
the means of redemption; those who realize its activity
being emancipated from the tyranny of circumstance into the
freedom of the eternal.

4. The Fourth Gospel.—Among the influences that shaped
the Fourth Gospel that of the Alexandrian philosophy must be
assigned a distinct, though not an exaggerated importance.
There are other books in the New Testament that bear the same
impress, the epistles to the Ephesians and the Colossians, and to
a much greater degree the epistle to the Hebrews. The
development that had thus begun in the time of Paul reaches maturity
in the Fourth Gospel, whose dependence on Philo appears
(1) in the use of the allegorical method, (2) in many coincident
passages, (3) in the dominant conception of the Logos. The
writer narrates the life of Christ from the point of view furnished
him by Philo's theory. True, the Logos doctrine is only
mentioned in the prologue to the Gospel, but it is presupposed
throughout the whole book. The author's task indeed was
somewhat akin to that of Philo, "to transplant into the world of
Hellenic culture a revelation originally given through Judaism."
This is not to say that he holds the Logos doctrine in exactly
the same form as Philo. On the contrary, the fact that he
starts from an actual knowledge of the earthly life of Jesus,
while Philo, even when ascribing a real personality to the Logos, keeps within the bounds of abstract speculation, leads him seriously to reflect upon the Philonic conceptions. Though the Alexandrian idea largely determines the extraneous features of the history, the history similarly reacts on the idea. The logography is an organic portion of the Gospel and not a preface written to conciliate a philosophic public. It assumes that the Logos idea is familiar in Christian theology, and vividly summarizes the main features of the Philonic conception—the eternal existence of the Logos, its relation to God (πρὸς τὸν θεόν, yet distinct), its creative, illuminative and redemptive activity. But the adaptation of the idea to John's account of a historical person involved at least three profound modifications:—(1) the Logos, instead of the abstraction or semi-personification of Philo, becomes fully personified. The Word that became flesh subsisted from all eternity as a distinct personality within the divine nature. (2) Much greater stress is laid upon the redemptive than upon the creative function. The latter is glanced at ("All things were made by him"), merely to provide a link with earlier speculation, but what the writer is concerned about is not the mode in which the world came into being but the spiritual life which resides in the Logos and is communicated by him to men. (3) The idea of λόγος as Reason becomes subordinated to the idea of λόγος as Word, the expression of God's will and power, the outgoing of the divine energy, life, love and light. Thus in its fundamental thought the prologue of the Fourth Gospel comes nearer to the Old Testament (and especially to Gen. i.) than to Philo. As speech goes out from a man and reveals his character and thought, so Christ is "sent out from the Father," and as the divine Word is also, in accordance with the Hebrew idea, the medium of God's quickening power.

What John thus does is to take the Logos idea of Philo and use it for a practical purpose—to make more intelligible to himself and his readers the divine nature of Jesus Christ. That this endeavour to work into the historical tradition of the life and teaching of Jesus—a hypothesis which had a distinctly foreign origin—led him into serious difficulties is a consideration that must be discussed elsewhere.

5. The Early Church.—In many of the early Christian writers, as well as in the heterodox schools, the Logos doctrine has been influenced by the Greek idea. The Syrian Gnostic Basiliades held (according to Irenaeus, i. 24) that the Logos or Word emanated from the πάντα, or personified reason, as this latter emanated from the unbegotten Father. This is a special type of the Valentinian Vallespiron, which regarded Wisdom as the last of the series of aeons that emanated from the original Being or Father, and the Logos as an emanation from the two first principles that issued from God, Reason (λόγος) and Truth. Just as the two are the summit of the series of the tutelary aeons, so God produced of His own nature a rational power (μονοτόν των λογίων), His agent in creation, who now became man in Jesus (Diog. c. Tryph. chap. 48, 60). He affirmed also the action of the λόγος σωτηρίων, (Apel. l. c. 46; ii. 13, &c.). With Tatian (Cohort. ad. Gr. chap. 5, &c.) the Logos is the beginning of the world, the reason that comes into being as the shaper of God's rational power. With Athenagoras (Suppl. chap. 9, 10) He is the prototype of the world and the enemies principle (λεγόμενον ἐν τοῖς ἔργοις) of things. Theophylact (Ad Autolyc. ii. 10, 24) taught that the Logos was in eternity with God as the λόγος ἐνθάλας, the counsellor of God, and that when the world was to be created God sent forth this counsellor (αὐτολόγων) from amongst the stars, not as the λόγος προφορικός, yet not so that the begotten Logos did not cease to be a part of Himself. With Hippolytus (Refui. x. 32, &c.) the Logos, produced of God's own substance, is both a fashioning or intelligent power that appears in the world as the Son of God, and the idea of the universe immanent in God. The early Sabellians (comp. Eusebius, Hist. Eccl. vi. 33; Athanasius, Contra Arian. iv.) held that the Logos was a faculty of God, the divine reason personified in the eternal, but not in distinct personality prior to the historical manifestation. Origen, the first to give an act of creation an eternity instead of time, affirmed the Logos personality in the Logos himself. In relation to God this Logos or Son was regarded as a new origin, and as such inferior to that. In relation to the world he was the means by which the Being was made known, by his redeeming power (Contra Cels. v. 608; Frag. de principi. i. 4; De principi. i. 109, 324).

In the statements of Hellenic speculation nothing essential was added to the doctrine of the Logos. Philo's distinction between God and His rational power or Logos in contact with the world was generally maintained by the eclectic Platonists and Neo-Platonists. By some of these this distinction was carried out to the extent of predating (as was done by Numenius of Apamea) three Gods:—the supreme God; the second God, or Demiurge or Logos; and the third God, or the world. Plotinus explained the λόγος as constructive forces, proceeding from the ideas and giving form to the dead images of sensible things (Enneads, v. 1 and Richter's Neuplat. Studien).

LOGOTHEZE—LOGROÑO 921

LOGOTHEZE (Med. Lat. logotheta, Gr. λογοθετεῖν, from λόγος, word, account, calculation, and τεταίρει, to set, i.e. "one who accounts, calculates or ratiocinates"), originally the title of a variety of administrative officials in the Byzantine Empire, e.g. the λογοθέτης Ῥωμαίων, who was practically the equivalent of the modern postmaster-general; and the λογοθέτης Ῥωμαίων, the logothete of the Roman military chest. Gibbon defines the great Logothete as "the supreme guardian of the laws and revenues," who "is compared with the chancellor of the Latin monarchies." From the Eastern Empire the title was borrowed by the West, though it only became firmly established in Sicily, where the logothetae occupied the position of chancellor elsewhere, his office being equal if not superior to that of the magnus cancellarius. Thus the title was borne by Pietro della Vigna, the all-powerful minister of the emperor Frederick II., king of Sicily.

See Du Cange, Glossarium, s. v. Logotheta.

LOGROÑO, an inland province of northern Spain, the smallest of the eight provinces formed in 1833 out of Old Castile; bounded N. by Burgos, Alava and Navarre, W. by Burgos, S. by Asturia and E. by Navarre and Saragossa. Pop. (1900) 818,376; area, 1946 sq. m. Logroño belongs entirely to the basin of the river Ebro, which forms its northern boundary except for a short distance near San Vicente; it is drained chiefly by the rivers Tiron, Oja, Najerilla, Iregua, Leza, Cidacos and Alhama, all flowing in a north-easterly direction. The portion skirting the Ebro forms a sparsely and for the most part fertile undulating plain, called La Rioja, but in the south Logroño is considerably broken up by oeshoots from the sierras which separate that river from the Douro. In the west the Cerro de San Lorenzo, the culminating point of the Sierra de la Demanda, rises 753 ft., and on the south the Pico de Urbion reaches 738 ft. The products of the province are cereals, good oil and wine (especially in the Rioja), fruit, silk, wool and tobacco. The principal export, although after 1892 this industry has greatly prospered on account of the protective duties imposed by France, are olive groves and irrigated meadows. The manufacturing industries are insignificant. A railway along the right bank of the Ebro connects the province with Saragossa, and from Miranda there is railway communication with Madrid, Bilbao and France; but there is no railway in the southern districts, where trade is much retarded by the lack even of good roads.

The province of logroño (Pop. 1900, 19,237 and the city of Calahorra (9345) are separately described. The only other towns with upwards of 5000 inhabitants are Haro (7974), Alfaro (5958) and Cervera del Rio Alhama (5930).

LOGROÑO, the capital of the Spanish province of Logroño, on the right bank of the river Ebro and on the Saragossa-La Rioja de Ebro railway. Pop. (1900) 19,237. Logroño is an ancient walled town, finely situated on a hill 1204 ft. high. Its bridge of twelve arches across the Ebro was built in 1138, but has frequently been restored after partial destruction by floods. The main street, arcaded on both sides, and the crooked but highly picturesque quarters of the older districts are in striking contrast with the broad, treelined avenues and squares laid out in modern times. The chief buildings are a bull-ring which
accommodates 11,000 spectators, and a church, Santa María de Palacio, called "the imperial," from the tradition that its founder was an astonished giant (72, 327). As the commercial centre of the fertile and well-cultivated plain of the Rioja, Logroño has an important trade in wine.

The district of Logroño was in ancient times inhabited by the Berones or Verones of Strabo and Pliny, and their Varia is to be identified with the modern suburb of the city of Logroño now known as Varea of Barea. Logroño was named by the Romans Fulibriga and afterwards Lucrinus. It fell into the hands of the Moors in the 8th century, but was speedily taken by the Christians, and under the name of Lucrinus appears with frequency in medieval history. It was unsuccessfully besieged by the French in 1521, and occupied by them from 1808 to 1813. It was the birthplace of the dumb painter Juan Fernandez Navarrete (1536-1579).

**LOGROSCINO—LOHENGRIN**

**LOGROSCINO (or Lo Grosco), NICOLA (1700-1765?).** Italian musical composer, was born at Naples and was a pupil of Durante. In 1738 he collaborated with Leo and others in the hasty production of Demetrio; in the autumn of the same year he produced a comic opera L'inganno per inganno, the first of a long series of comic operas, the success of which won him the name of "il Dio dell' opera buffa." He went to Palermo, probably in 1747, as a teacher of counterpoint; as an opera composer he is last heard of in 1760, and is supposed to have died about 1763. Logroscino has been credited with the invention of the concerted operatic finale, but as far as can be seen from the score of II Governatore and the few remaining fragments of other operas, his finales show no advance upon those of Leo. As a musical humorist, however, he deserves remembrance, and may justly be classed alongside of Rossini.

**LOGWOOD** (so called from the form in which it is imported), the heart-wood of a leguminous tree, *Haematoxyylon campechi-anum*, native of Central America, and grown also in the West Indian Islands. The tree attains a height not exceeding 40 ft., and is said to be ready for felling when about ten years old. The wood, deprived of its bark and the sap-wood, is sent into the market in the form of large blocks and billets. It is very hard and dense, and externally has a dark brownish-red colour; but it is less deeply coloured within. The best qualities come from Campeachy, but it is obtained there only in small quantity.

Logwood is used in dyeing (q.v.), in microscopy, in the preparation of ink, and to a small extent in medicine on account of the tannic acid it contains, though it has no special medicinal value, being much inferior to kino and catechu. The wood was introduced into Europe as a dyeing substance soon after the discovery of America, but from 1581 to 1662 its use in England was prohibited by legislative enactment on account of the inferior dyes which at first were produced by its employment.

The colouring principle of logwood exists in the timber in the form of a glucoside, from which it is liberated as haematoxylin by fermentation. Haematoxylin, C₇H₆O₃N₂, was isolated by M. L. Chevreul in 1810. It forms a crystalline hydrate, C₂H₆O₂·3H₂O, which is a colourless body very sparingly soluble in cold water, but dissolving freely in hot water and in alcohol. By exposure to the air, especially when warmed, it is rapidly oxidized into isoeisenamine, C₇H₆O₂N₂, with the development of a fine purple colour. This reaction of haematoxylin is exceedingly rapid and delicate, rendering that body a laboratory test for alkaloids. By the action of hydrogen and sulphurous acid haematoxylin is converted into haematin. It is not necessarily related to brazilin, found in brazil leguminous, *Haematoxylos campechi-anus* and *H. brasiliensis*; and so its oxidation products, haematin and brazilin, have been elucidated by W. H. Perkin and his pupils (see *Journ. Chem. Soc.*, 1908, 1909).

**LOHARU, a native state of India, in the south-east corner of the Punjab, between Hisar district and Rajputana. Area, 222 sq. m.; pop. (1901) 15,229; estimated gross revenue, £4800. The chief, whose title is nawab, is a Mahomedan, of Afghan descent. The nawab Sir Amir-ud-din-Ahmad Khan, K.C.I.E., who is a member of the viceroy's legislative council, was until 1905 administrator and adviser of the state of Maler Kotal. The town of Loharu had a population in 1901 of 3175.**

**LÖHE, JOHANN KONRAD, WILHELM (1808-1873).** German divine and philanthropist, was born on the 1st of February 1808 in Fürth near Nuremberg, and was educated at the universities of Erlangen and Berlin. In 1831 he was appointed vicar at Kirchenlamitz, where his fervent evangelical preaching attracted large congregations and puzzled the ecclesiastical authorities. A similar experience ensued at Nuremberg, where he was assistant pastor of St Egidius. In 1837 he became pastor in Neuendettelsau, a small and unattractive place, where his life's work was done, and which he transformed into a busy and influential community. He was interested in the spiritual condition of Germans who had emigrated to the United States, and built two training homes for missionaries to them. In 1849 he founded the Lutheran Society of Home Missions and in 1853 an institution of deaconesses. Other institutions were added to these, including a lunatic asylum, a Magdalene refuge, and hospitals for men and women. In theology Löhe was a strict Lutheran, but his piety was of a most attractive kind. Originality of conception, vividness of presentation, fertility of imagination, wide knowledge of Scripture and a happy faculty of applying it, intense spiritual fervour, a striking physique and a powerful voice made him a great pulpit force. He wrote a good deal, amongst his books being Drei Bücher von der Kirche (1843), *Summenkörner des Gebetes* (over 50 editions) and several volumes of sermons. He died on the 2nd of January 1872.

**LOHENGRIN, the hero of the German version of the legend of the knight of the swan. The story of Lohengrin as we know it is based on two principal motives common enough in folklore: the metamorphosis of human beings into swans, and the curious wife whose question brings disaster. Lohengrin's (the swan) was originally the little brother who, in one version of "the Seven Swans," was compelled through the destruction of his golden chain to remain in swan form and attached himself to the fortunes of one of his brothers. The swan played a part in classical mythology as the bird of Apollo, and in Scandinavian lore the swan maidens, who have the gift of prophecy and are sometimes confused with the Valkyries, reappear again and again. The wife's desire to know her husband's origin is a parallel of the myth of Cupid and Psyche, and bore in medieval times a similar mystical interpretation. The Lohengrin legend is localized on the Lower Rhine, and its incidents take place at Antwerp, Nijmegen, Cologne and Mainz. In its application it falls into sharp division in the hands of German and French poets. By the Germans it was turned to mystical use by being attached loosely to the Grail legend (see Grail and Perceval); in France it was adapted to glorify the family of Godfrey de Bouillon.

The German story makes its appearance in the last stanzas of Wolfram von Eschenbach's *Parzival*, where it is related how Parzival's son, Loheringr,1 was sent from the castle of the Grail to the help of the young duchess of Brabant. Guided by the swan he reached Antwerp, and married the lady on condition that she should not ask his origin. On the breach of this condition years afterwards Lohengrin departed, leaving her with his sword, horn and ring behind him. Between 1235 and 1290, a Bavarian disciple of Wolfram's 2 adopted the story and developed it into an epic poem of nearly 8000 lines, incorporating episodes of Lohengrin's prowess in tournament, his wars with Henry I. against the heathen Hungarians and the Saracens, and incidentally providing a detailed picture of the everyday life of people of high condition. The epic of Lohengrin is put by the anonymous writer into the mouth of Wolfram, who is made to relate it during the Contest of the Singers at the Wartburg in proof of his superiority in knowledge of sacred things over Klingsor the magician, and the poem is thus linked to German literature.

1 i.e. Garin le Loherin (q.v.), or Garin of Loraine.

2 Elster (Beiträge) says that the poem is the work of two poets: the first part by a Thuringian wandering minstrel, the second— which differs in style and dialect—by a Bavarian official.
tradition. Its connexion with Parzival implies a mystic application.

The consecrated wafer shared by Lohengrin and the swan on their voyage is one of the more obvious means taken by the poet to give the tale the character of an allegory of the relations between Christ, the Church and the human soul. The story was followed closely in its main outlines by Richard Wagner in his opera Lohengrin.

The French legend of the knight of the swan is attached to the house of Bouillon, and although William of Tyre refers to it about 1170 as fable, it was incorporated without question by later annalists. It forms part of the cycle of the chansons de geste dealing with the Crusade, and relates how Helias, knight of the swan, is guided by the swan to the help of the duchess of Bouillon and marries her daughter Ida or Beatriz in circumstances exactly parallel to the adventures of Lohengrin and Elsa of Brabant, and with the like result. Their daughter marries Eustache, count of Boulogne, and had three sons, the eldest of whom, Godfreyd (Godfrey), is the future king of Jerusalem. But in French story Helias is not the son of Parzival, but of the king and queen of Lillefort, and the story of his birth, of himself, his five brothers and one sister is, with variations, that of the "seven swans" persecuted by the wicked grandmother, which figures in the pages of Grimm and Hans Andersen. The house of Bouillon was not alone in claiming the knight of the swan as an ancestor, and the tradition probably originally belonged to the house of Cleves.

German Versions.—See Lohengrin, ed. Rückert (Quedlinburg and Leipzig, 1858); another version of the tale, Lorengel, is edited in the Zeitschr. für deutscbes Altertum (vol. 15); modern German translation of Lohengrin, by H. A. Junghaus (Leipzig, 1879); Conrad von Württemberg, Chanson de geste Lohengrin (Würzburg, 1881). Cf. Elster, Beitrag zur Kritik des Lohengrin (Halle, 1884), and K. Heinrichs, Die Lohengrinschrift und ihre Deutung (Hamm i. West., 1906).

English Versions.—Baron de Reiffenberg, Le Chevalier au cygne et Godfrey de Bouillon (Brussels, 2 vols., 1846-48), in Mon. pour servir à l'histoire de la province de Namur; C. Hippeau, La Chanson du chevalier au cygne (1874); H. A. Todd, La Nuit de chevalier au cygne (1886, ed. E. Hoffmann, Brussels, 1888); cf. the Latin tale by Jean de Hacqueville (Johannes de Alta Silva) in his Dolopahiai (ed. Costerley, Strassburg, 1879).

English Versions.—In England the story first appears in a short poem preserved among the Cotton MSS. of the British Museum and entitled Chevalier assigne. This was edited by G. E. V. Utston in 1800 for the Roxburghe Club, and again by H. H. Gibbs in 1868 for the Early English Society. These early versions are accompanied by a set of photographs of a 14th-century ivory casket, on which the story is depicted in 36 compartments. An English prose romance, Helias Knight of the Swan, translated by Robert Copeland, and printed in 1500, is founded on a French romance La Généalogie. . . Le Godfrey de Boulin (printed 1504) and is reprinted by W. J. Thoms in Early Prose Romances, vol. iii. It was also printed by Wynkyn de Worde in 1512. A modern edition was issued in 1901 from the Corder Club, New York.

LOIN—LOIRE

LOIN (through O. Fr. loigne or lagne, mod. longe, from Lat. lumbus), that part of the body in an animal which lies between the upper end of the spine and the lower part of the ribs, and on either side of the back-bone, hence in the plural the general term for the lower part of the human body at the junction with the legs, covered by the loin-cloth, the almost universal garment among primitive peoples. There are also figurative uses of the word, chiefly biblical, due to the loins being the supposed seat of male vigour and power of generation. Apart from these uses the word is a butcher's term for a joint of meat cut from this part of the body. The upper part of a loin of beef is known as the "sirloin" (Fr. surlone, i.e. upper loin). This has been commonly corrupted into "sirloin," and a legend invented, to account for the name, of a king, James I, or Charles II., knighting a prime joint of beef "Sir Loin" in pleasure at its excellence. A double sirloin, undivided at the back-bone, is known as a "baron of beef," probably from an expansion of the legend of the "Sir Loin."

LOIRE, the longest river of France, rising in the Gerbier de Jonc in the department of Ardèche, at a height of 4500 ft. and flowing north and west to the Atlantic. After a course of 18 m. in Ardèche it enters Haute-Loire, in which it follows a picturesque channel along the foot of basaltic rocks, through narrow gorges and small plains. At Vorey, where it is joined by the Arzon, it becomes navigable for rafts. Four miles below its entrance into the department of Loire, at La Noire, river navigation is officially reckoned to begin, and breaking through the gorges of Saint Victor, the Loire enters the wide and swampy plain of Forez, after which it again penetrates the hills and flows out into the plain of Roanne. As in Haute-Loire, it is joined by a large number of streams, the most important being the Loise on the right and the Lignon du Nord or du Forez and the Aix on the left. Below Roanne the Loire is accompanied on its left bank by a canal to Digoin (35 m.) in Saône-et-Loire, thence by the so-called "lateral canal of the Loire" to Briare (122 m.). Owing to the extreme irregularity of the river in different seasons these canals form the only certain navigable way. At Digoin the Loire receives the Arroux, and gives off the canal du Centre (which utilizes the valley of the Bourbince) to Chalon-sur-Saône. At this point its northerly course begins to be interrupted by the mountains of Morvan, and flowing north-west it enters the department of Nièvre. Just beyond Nevers it is joined by the Allier; this river rises 30 m. S.W. of the Loire in the department of Lozère, and following an almost parallel course has at the confluence a volume equal to two-thirds of that of the main stream. Above Nevers the Loire is joined by the Aron, along which the canal du Nivernais proceeds northward, and the Nièvre, and below the confluence of the Allier gives off the canal du Berry to Bourges and the navigable part of the Cher. About this point the valley becomes more ample and at Briare (in Loiret) the river leaves the highlands and flows between the plateaus of Gatinais and the Beauce on the right and the Sologne on the left. In Loiret it gives off the canal de Briare northward to the Seine and itself bends north-west to Orléans, whence the canal d'Orléans, following the little river Cens, communicates with the Briare canal. At Orléans the river changes its north-western course for a south-western course, to striking peculiarities of the Loire in Loiret and the three subsequent departments is that they frequently flow in a parallel channel to the main stream and in the same valley. Passing Blois in Loir-et-Cher, the Loire enters Indre-et-Loire and receives on the right the Cisse, and, after passing Tours, the three important left-hand tributaries of the Cher, Indre and the Vienne. At the confluence of the Vienne the Loire enters Maine-et-Loire, in its course through which department it is frequently divided by long sandy islands fringed with osiers and willows; while upon arriving at Les Ponts-de-Cé it is split into several distinct branches. The principal tributaries are: left, the Thouet at Saumur, the Layon and the Èvre; right: the Authion, and, most important tributary of all, the Maine, formed by the junction of the rivers Mayenne, Sarthe and Loir. Through Loire-Inferieure the river is studded with islands until below Nantes, where the largest of them, called Bellet-Ile, is found. It receives the Erdre on the right at Nantes and on the opposite shore the Sèvre-Nantaise and farther on the Vallée de la Maine and the navigable Etel de Mâcon on the right near Saint Nazaire. Below Nantes, between which point and La Martinière (below Pellerin) the channel is embanked, the river is known as the Loire Maritime and widens out between marshy shores, passing Painbcuf on the left and finally Saint-Nazaire, where it is 13 m. broad. The length of the channel of the Loire is about 625 m.; its drainage area is 46,700 sq. m. A lateral canal (built in 1881-1892 at a cost of about £1,000,000) known as the Maritime Canal of the Loire between Le Carnet and La Martinière enables large ships to ascend to Nantes. It is 9 m. long, and 10 ft. (capable of being increased to 24 ft.) deep. At each end is a lock 405 ft. long by 50 ft. wide. The canal de Nantes à Brest connects this city with Brest.

The Loire is navigable only in a very limited sense. During the drought of summer thin and feeble streams thread their way between the sandbanks of the channel; while at other times a stupendous submergence wide reaches of land. In the middle part of its course the Loire traverses the western portion of the undulating Paris basin, with its Tertiary marls, sands and clays, and the
allevium carried off from these renders its lower channel inaccessible. The rest of the drainage area is occupied by crystalline rocks, on the hard surface of which the water, undiminished by absorption, flows rapidly into the streams. When the floods of two or more tributaries arrive at the same time serious inundations result. Attempts to protect the plains under the dykes, however, so much narrowed that the embankments are almost certain to give way as soon as the water rises 16 ft. (the average rise is about 14 ft. and the maximum rise 18 ft.). In modern times embankments, aided by dredging operations extending over a large area, have ensured a depth of 18 ft. in the channel between La Martiniere and Nantes. Several towns have constructed special works to defend themselves against the floods; Tours, the most exposed of all, is surrounded by embankments made of Teams.

Various schemes for the systematic regulation of the Loire have been discussed. It has been suggested to construct in the upper valleys of the several affluents a number of gigantic dams or reservoirs from which the water, stored during the year, could be let off into the river as required. A dam of this kind was made (1711) at the village of Pinay, about 18 m. above Roanne, and capable of retaining 350 to 450 million cu. ft. of water, has greatly diminished the force of the floods at Roanne, and maintained the comparative equilibrium of the current during the dry season. Three other dams of modern construction are also in existence, one near Firminy, the other two near St Etiene.

LOIRE, a department of central France, made up in 1790 of the old district of Forez and portions of Beaujolais and Lyonnais, all formerly included in the province of Lyonnais. Pop. (1906) 633,943. Area 1853 sq. m. It is bounded N. by the department of Saone-et-Loire, E. by those of Rhone and Isere, S. by Ardèche and Haute Loire, and W. by Puy-de-Dôme and Allier. Forez 1700 to 1703 it constituted, along with that of Rhone, a single department (Rhône-et-Loire). It takes its name from the river which bisects it from south to north. The Rhone skirts the S.E. of the department, about one-eighth of which belongs to its basin. After crossing the southern border the Loire runs through wild gorges, passing the picturesque crag crown land the old fortress of St Paul-en-Cornillon. At St Rambert it issues into the broad plain of Fotez, flows north as far as its confluence with the Aix where the plain ends, and then again traverses gorges till it enters the less extensive plain of Roanne in the extreme north of the department. These two plains, the beds of ancient lakes, are enclosed east and west by chains of mountains running parallel with the river. In the west are the Forez mountains, which separate the Loire basin from the basin of the Allier; the highest point (Pierre sauvage, 1913 ft.) is in the depart of Monts du Loire. They sink gradually towards the north, and are successively called Bois Noirs (2430 ft.), from their woods, and Monts de la Madeleine (3822 to 1649 ft.). In the east the Rhone and Loire basins are separated, by Mont Pilat (4705 ft.) at the north extremity of the Cévennes, and by the hills of Lyonnais, Tarare, Beaujolais and Charolais, none of which rises higher than 3260 ft. Of the affluents of the Loire the most important are the Lignon du Nord, the beautiful valley of which has been called " La Suisse Forezienne," and the Aix on the left, and on the right the Ondaine (on which stand the industrial towns of Chambon-Feugereilles and Firminy), the Furens and the Rhin. The Gier forms a navigable channel to the Rhone at Givors, and has on its banks the industrial towns of St Chamond and Rive-de-Gier. From Mont Pilat descends the Déôme, in the valley of which are the workshops of Annay (q.v.). The climate on the heights is cold and healthy, it is unworthy in the marshy plains of Forez, mild in the valley of the Rhone. The annual rainfall varies from 39 to 48 in. on the Forez mountains, but only reaches 20 to 24 in. in the vicinity of Montbrison.

The plains of Forez and Roanne are the two most important agricultural districts, but the total production of grain within the department is insufficient for the requirements of the population. The department is rich in pastures, but which is irrigated by the canal of Forez, support a large number of live stock. Good pasturage is also found on the higher levels of the Forez mountains, on the northern plateaus, where oxen of the Charolais breed are raised, and on the uplands generally. Wheat and rye are the leading cereal crops; oats come next in importance, barley and colza occupying a relatively small area. The vine is cultivated in the valley of the Rhone, on the lower slopes of the Forez mountains and on the hills west of the plain of Roanne. The forests of Mont Pilat and the Forez chain yield good-sized pines and wood for mining purposes. The so-called Lyons chestnuts are also found in the department. The chief industries of Mont Pilat yield medicinal plants, such as mint. Poultry-rearing and bee-keeping are considerable industries. The department is rich in mineral springs, the waters of St Galmier, Sall-sous-Couzan, Roanne, and Montbrison have long been enjoyed, being largely medicinal. The chief branch of the agricultural industries is carried on Rive-de-Gier and St Chamond. St Etienne is the commercial centre of the Loire and the department, and is a large railway junction. Several of the large departmental lines, such as the Paris-Rouen, Paris-Lyon and the Paris-Le Mans lines, have their termini here. St Etienne is a large woollen-manufacturing centre. The department is rich in iron and steel, and iron and steel works are found at St Etienne, Roanne, and Rive-de-Gier. The department contains a large number of small iron and steel works, besides the large works at St Etienne. The products include rivets, common cutlery, chain cables for the mines, tools, &c., occupies thousands of hands. Cast steel is largely manufactured, and the workshops of the department supply the heaviest constructions required in naval architecture, as well as war machines and machinery of every description. The glass industry is carried on Rive-de-Gier and St Chamond. St Etienne and St Chamond are centres for the manufacture of silk ribbons, elastic rubber and rubber, and the dressing of raw silks. Between 50,000 and 60,000 people are employed in the last-named industries. The arrangement of Roanne manufactures cotton stuffs, muslins and the like. That of Montbrison produces table linen. The department has numerous dye-works, paper, paper manufactures, flour-mills, silk-spinning works and hat factories. It is served by the Paris-Lyon railway, Roanne being the junction of important lines from Paris to Lyons and St Etiene. Within the department, the second line of the main rail-network, the forez, is a channel. River ways are the canal from Roanne to Digoin (13 m. in the department), that from Givors to Rive-de-Gier (7 m.) and the Rhone (7 m.).

Loire comprises three arrondissements—St Etiene, Montbrison and Roanne—with 31 cantons and 335 communes. It falls within the region of the XIII. army corps and the diocese and académie (educational circumscription) of Lyons, where also it is its court of appeal. St Etiene is the capital, other leading towns being Roanne, Montbrison, Rive-de-Gier, St Chamond, Firminy and the S. Bank of the Loire, besides old houses, has a church of the 17th and 16th centuries, containing paintings of the 15th century; St Rambert and St Romain-le-Puy have priory churches of the 11th and 12th centuries; and at Chartres there are remains of a Benedictine abbey founded in the 9th century, including a porch decorated with fine Romanesque carving.

LOIRE-INFERIEURE, a maritime department of western France, made up in 1790 of a portion of Brittany on the right and of the district of Retz on the left of the Loire, and bounded W. by the ocean, N. by Morbihan and Ille-et-Vilaine, E. by Maine-et-Loire and S. by Vendée. Pop. (1906) 666,748. Area 2604 sq. m. The surface is very flat, and the highest point, in the north on the borders of Ille-et-Vilaine, reaches only 377 ft. The line of hillocks skirting the right bank of the Loire, and formed as the sillon de l'arche, as well as war makers below, Savenay they recede from the river, and meadows give place to peat bogs. North of St Nazaire and Grande Bréde, measuring 9 m. by 6, and rising hardly 10 ft. above the sea-level, still supplies old trees which can be used for joiners' work. A few scattered villages occur on the more elevated spots, but communication is effected chiefly by the canals which intersect it. The district south of the Loire lies equally low; its most salient feature is the lake of Grandlieu, covering 27 sq. m., and surrounded by low and marshy ground, but so shallow (65 ft. at most) that drainage would be comparatively easy. The Loire (q.v.) has a course of 70 m. within the department. On the left bank a canal stretches for 9 m. between Pellerin, where the dikes which protect the Loire valley from inundation terminate, and Paimbœuf, and vessels drawing 17 or 18 ft. can reach Nantes. The principal towns on the right are St Nazaire, Loire, St Nazaire, and St Nazerel (one of the important commercial ports of France) on the right, and Paimbœuf on the left. The chief affluents are, on the right, the Erdre and on the left the Sèvre, both debouching at Nantes. The Erdre in its lower course broadens in places to lakes which give it the appearance of a large river. Four miles below Nort it coalesces with the

924  LOIRE—LOIRE-INFERIEURE
canal from Nantes to Brest. The Sevre is hemmed in by picturesque hills; at the point where it enters the department it flows past the beautiful town of Clisson with its imposing castle of Coueron. Apart from the Sevre, the only navigable channel of importance within the department is the Nantes and Brest canal, fed by the Isac, a tributary of the Vilaine, which separates Loire-Inférieure from Ille-et-Vilaine and Morbihan. The climate is mild, humid and equable. At Nantes the mean annual temperature is 54.9°F., and there are one hundred and twenty-two rainy days, the annual rainfall being 25.6 in.

Horse and cattle raising prosper, being carried on chiefly in the west of the department and in the Loire valley. Good butter and cheese are produced. Poultry also is reared, and there is a good deal of dairying. Wheat, oats, buckwheat and potatoes are produced in great abundance; leguminous plants are also largely cultivated, especially near Nantes. Wine, cider and fagor crops are the chief remaining agricultural products. The woods are of oak in the interior and pine on the coast. The department has deposits of tin, lead and iron. N.W. of Ancenis coal is obtained from a bed which is a prolongation of that of Anjou. The soil marshes, about 6000 acres in all, occur for the most part between the mouth of the Vilaine and the Loire, and on the Bay of Bourgneuf, and salt-refining, of which Guérande is the centre, is an important industry. The granite of the sea-coast and of the Loire up to Nantes is quarried for large blocks. Steam-engines are built for the government at Indreet and Oléron, and at Nantes there is a good repute for their quality of iron; and the production of the lead-smelting works at Couturon amounts to several millions of francs annually. There are also considerable foundries at Nantes, Châteaubriant, St Nazaire and St Nazaire, and those at Nantes and St Nazaire. Among other industries may be mentioned the preparation of pickles and preserved meats at Nantes, the curing of sardines at Le Croisic and in the neighbouring communes, the manufacture of sugar, buses, tobacco, maccaroni and similar foods, soap and chemicals at Nantes, and of paper, sugar and soap at Chantenay. Fishing is prosecuted along the entire coast, particularly at Le Croisic. Among the seaside resorts Le Croisic, Pornichet and Marennes are the most important. The department is traversed by the railway of the Loire, the Orléans company and the Western company. The department is divided into five arrondissements—Nantes, Ancenis, Châteaubriant, Paimbœuf and St Nazaire. 45 cantons and 219 communes. It has its own chapter at Renne, which is also the centre of the académie (educational division) to which it belongs.

The principal places are Nantes, the capital, St Nazaire and Châteaubriant, which receive separate treatment. On the west coast the town of Batz, and the neighbouring villages, situated on the peninsula of Batz, are inhabited by a small community possessed of a distinct costume and dialect, and claiming descent from a Saxon or Scandinavian stock. Its members are employed for the most part in the salt marshes of the town. Guérande has well-preserved ramparts and gates of the 15th century, a church dating from the 12th to the 16th centuries, and other old buildings. At St Philibert-de-Grandlieu there is a church, rebuilt in the 16th and 17th centuries, but preserving remains of a previous edifice belonging at least to the beginning of the 11th century.

LOIRET, a department of central France, made up of the three districts of the ancient province of Orléans—Orléanais proper, Gâtinais and Dunois together with portions of those of Ille-de-France and Berry. It is bounded N. by Seine-et-Oise, N.E. by Seine-et-Marne, E. by Yonne, S. by Nièvre and Cher, S.W. and W. by Loir-et-Cher and N.W. by Eure-et-Loir. Area, 2629 sq. m. (Pop. (1906) 364,999). The name is borrowed from the Loire, a stream which issues from the ground some miles to the south of Orléans, and after a course of about 7 m. falls into the Loire; its large volume gives rise to the belief that it is a subterranean branch of that river. The Loire traverses the south of the department by a broad valley which, though frequently devastated by disastrous floods, is famed for its rich tilled lands, its castles, its towns and its vine-clad slopes. To the north of the Loire are the Gâtinais (capital Montargis) and the Beauce; the former district is so named from its gîtes or wildernesses, of which saffron is, along with honey, the most noteworthy product; the Beauce (q.v.), a monotonous tract of corn-fields without either tree or river, has been called the granary of France. Between the Beauce and the Loire is the extensive forest of Orléans, which is slowly disappearing before the advances of agriculture. South of the Loire is the Sologne, long barren waste, freed from the impermeability of its subsoil, but now much improved in both respects by means of pine plantation and draining and manuring operations. The highest point (on the borders of Cher) is 900 ft. above sea-level, and the lowest (on the borders of Seine-et-Marne) is 220 ft. The watershed on the plateau of Orléans between the basins of the Seine and Loire, which divide Loiret almost equally between them, is almost imperceptible. The lateral canal of the Loire from Roanne stops at Briare; from the latter town a canal (canal de Briare) connects with the Seine by the Loing valley, which is joined by the Orléans canal below Montargis. The only important tributary of the Loire within the department is the Loing; the Loing, a tributary of the Seine, has a course of 40 m. from south to north, and is accompanied first by the Briare canal and afterwards by that of the Loing. The Essonne, another important affluent of the Seine, leaving Loiret below Malesherbes, takes its rise on the plateau of Orléans, as also does its tributary the Juine. The department has the climate of the Sequanian region, the mean temperature being a little above that of Paris; the rainfall varies from 18.5 to 27.5 in., according to the district, that of the exposed Beauce being lower than that of the well-wooded Sologne. Hailstorms cause much destruction in the Loire valley and the neighbouring regions.

The department is essentially agricultural in character. A large number of sheep, cattle, horses and pigs are reared; poultry, especially geese, and bees are plentiful. The yield of wheat and oats is in excess of the consumption; rye, barley, meslin, potatoes, beetroot, colza and forage plants are also cultivated. Wine in abundance, but of inferior quality, is grown on the hills of the Loire. Buckwheat supports bees by its flowery blossoms, and its seeds. Saffron is another source of profit. The woods consist of oak, elm, birch and pine; fruit trees thrive in the department, and Orléans is a great centre of nursery gardens. The industries are tannery, wood manufacture, tinsmithing, paper and the manufacture of pins, nails and files, represent the chief metal-working industries. The production of hosiery, wool-spinning and various forms of wool manufacture are also engaged in. A centre of a great degree of the manufacture of porcelain (faïence d'Orléans). The tanneries produce excellent leather; paper-making, sugar-refining, wax-bleaching and the manufacture of caoutchouc complete the list of industries. The four arrondissements are those of Orléans, Cenon, Montargis and Pithiviers, with 31 and 349 communes. The department forms part of the académie (educational division) of Paris.

Besides Orléans, the capital, the most noteworthy places, Gen, Montargis, Beaugency, Pithiviers, Briare and St Benoît-sur-Loire, are separately noticed. Outside these towns notable examples of architecture are found in the churches of Cléry (15th century), of Ferrières (13th and 14th centuries) of Puisieux (12th and 13th centuries) and Meung (12th century). At Gerny-des-Prés there is a church built originally at the beginning of the 9th century and rebuilt in the 10th century, in which there are some early examples of manuscript painting. Yèvre-le-Châtel has an interesting château of the 13th century, and Sulcy-sur-Loire the fine medieval château rebuilt at the beginning of the 17th century by Maximilien de Béthune, duke of Sulcy, the famous minister of Henry IV. There are remains of a Gallo-Roman town (perhaps the ancient Veixaudunum) at Triguères and of a Roman amphitheatre near Montbouy.

LOIR-ET-CHER, a department of central France, formed in 1790 from a small portion of Touraine, the Perche, but chiefly from the Dunois, Vendômois and Blésois, portions of Orléans. It is bounded N. by Eure-et-Loir, N.E. by Loiret, S.E. by Cher, S. by Indre, S.W. by Indre-et-Loire and N.W. by Sarthe. Pop. (1906) 276,019. Area, 2479 sq. m. The department takes its name from the Loire and the Cher by which it is traversed in the north and south respectively. The Loir rises on the eastern border of the Perche and joins the Maine after a course of 195 m.; the Cher rises on the Central Plateau near Aubusson, and reaches the Loire after a course of 219 m. The Loire flows through the
department from north-east to south-west, and divides it into two nearly equal portions. To the south-east is the district of the Sologne, to the north-west the rich wheat-growing country of the Beauce (q.v.) which stretches to the Loire. Beyond that river lies the Perche. The surface of this region, which contains the highest altitude in the department (840 ft.), is varied by hills, valleys, hedged fields and orchards. The Sologne was formerly a region of forests, of which those in the neighbourhood of Chambord are the last remains. Its soil, once barren and marshy, has been considerably improved by draining and afforestation, though pools are still very numerous. The district is much frequented by sportsmen. The Cher and Loir traverse pleasant valleys, occasionally bounded by walls of tuft in which dwellings have been excavated, as at Les Roches in the Loir valley; the stone, hardened by exposure to the air, is also used for building purposes. The Loire and, with the help of the Berry canal, the Cher are navigable. The chief remaining rivers of the department are the Beuvron, which flows into the Loire on the left, and the Sauldre, a right-hand affluent of the Cher. The climate is temperate and mild, though that of the Beauce tends to dryness and that of the Sologne to dampness. The mean annual temperature is between 52° and 53° F.

The department is primarily agricultural, yielding abundance of wheat and oats. Besides these the chief products are rye, wheat and potatoes. Vines thrive on the valley slopes, the vineyards falling into four groups—those of the Cher, which yield fine red wine, that of the Loir, the Bessins and those of the Loire, in which the grapes are of good quality; the valleys of fruit-trees and nursery gardens are numerous; the asparagus of Romorantin and Vendôme is well-known. The Sologne supplies pine and birch for fuel, and there are extensive forests around Blois and on both sides of the Loir. Parchment is of good quality in the Loir valleys. Sheep are the chief stock; the Perche breed of horses is much sought after for its combination of lightness and strength. Bee-farming is of some importance in the Sologne. Formerly the specialty of Loir-et-Cher was the production of gun-flints. Stone quarries are numerous. The chief industries are the cloth-manufacture of Romorantin, and leather-dressing and glove-making at Vendôme; and lime-burning, flour-milling, distilling, saw-milling, paper-making and the manufacture of "sabots" and boots and shoes, boxes and linen goods, are carried on. The department is served chiefly by the Orléans railway.

The arrondissements are those of Blois, Romorantin and Vendôme, with 24 cantons and 207 communes. Loir-et-Cher forms part of the educational division (académie) of Paris. Its court of appeal and the headquarters of the V. army corps, to the regions of which it belongs, are at Orléans. Blois, the capital, Vendôme, Romorantin and Chambord are noticed separately. In addition to those of Blois and Chambord there are numerous fine châteaux in the department, of which that of Montrichard with its donjon of the 11th century, that of Chaumont dating from the 15th and 16th centuries, and that of Cheverny (17th century) in the late Renaissance style are the most important. Those at St Aignan, Lassey, Lavardin and Cellettes may also be mentioned. Churches wholly or in part of Romanesque architecture are found at Faverolles, Selves-sur-Cher, St Aignan and Suèvres. The village of Tréo is built close to ancient tumuli and has an interesting church of the 12th century, and among other remains those of a Lazar-house of the Romanesque period. At Pontlevoy are the church, consisting of a fine choir in the Gothic style, and the buildings of a Benedictine abbey. At La Poissonnière (near Montoire) is a small Renaissance manor-house, in which Ronsard was born in 1524.

LOISY, ALFRED FIRMIN (1857–), French Catholic theologian, was born at Ambrières in French Lorraine of parents who, descended from a long line of resident peasantry, tilled there the soil themselves. The physically delicate boy was put into the ecclesiastical school of St Didier, without any intention of a clerical career; but he decided for the priesthood, and in 1874 entered the Grand Séminaire of Châlons-sur-Marne. Mgr Meignan, then bishop of Châlons, afterwards cardinal and archbishop of Tours, ordained him priest in 1879. After being curé of two villages in that diocese, Loisy went in May 1881, to study and take a theological degree, to the Institut Catholique in Paris. Here he was influenced, as to biblical languages and textual criticism, by the learned and loyal-minded Abbé Paulin Martin, and as to a vivid consciousness of the true nature, gravity and urgency of the biblical problems and an Attic sense of form by the historical intuition and the mordant irony of Abbé Louis Duchesne. At the governmental institutions, Professors Oppert and Halévy helped further to train him. He took his theological degree in March 1890, by the oral defence of forty Latin scholastic theses and by a French dissertation, Histoire du canon de l'ancien testament, published as his first book in that year.

Professor now at the Institut Catholique, he published successively his lectures: Histoire du canon du N.T. (1891); Histoire critique du texte et des versions de la Bible (1892); and Les Évangiles synoptiques (1893, 1894). The two latter works appeared successively in the bi-monthly L'Enseignement biblique, a periodical written throughout and published by himself. But already, on the occasion of the death of Ernest Renan, October 1882, the attempts made to clear up the main principles and results of biblical science, first by Mgr d'Hulst, rector of the Institut Catholique, in his article La Question biblique (Le Correspondant, Jan. 25th, 1883), and then by Loisy himself, in his paper "La Question biblique et l’inspiration des Écritures" (L’Enseignement biblique, Nov.-Dec. 1893), promptly led to serious trouble. The latter article was immediately followed by Loisy’s dismissal, without further explanation, from the Institut Catholique. And a few days later Pope Leo XIII. published his encyclical Providentissimus Deus, which indeed directly condemned not Abbé Loisy’s but Mgr d’Hulst’s position, yet rendered the continued publication of consistently critical work so difficult that Loisy himself suppressed his Enseignement at the end of 1893. Five further instalments of his Synoptiques were published after this, bringing the work down to the Concession of Peter inclusively.

Loisy next became chaplain to a Dominican convent and girls’ school at Neuilly-sur-Seine (Oct. 1894–Oct. 1899), and here nurtured his apologetic method, resuming in 1898 the publication of longer articles, under the pseudonyms of Després and Firmin in the Revue du clergé français, and of Jacques Simon in the lay Revue d’histoire et de littérature religieuses. In the former review, a striking paper upon development of doctrine (Dec. 1st, 1898) headed a series of studies apparently taken from an already extant large apologetic work. In October 1890 he resigned his chaplaincy for reasons of health, and settled at Bellevue, somewhat farther away from Paris. His notable paper, “La Religion d’Israel” (Revue du clergé français, Oct. 15th, 1900), the first of a series intended to correct and replace Renan’s presentation of that great subject, was promptly censured by Cardinal Richard, archbishop of Paris; and though scholarly and zealous ecclesiastics, such as the Jesuit Père Durand and Monseigneur Mignot, archbishop of Albi, defended the general method and several conclusions of the article, the aged cardinal never rested henceforward till he had secured a papal condemnation also. On the end of 1900 Loisy secured a government lectureship at the École des Hautes Études Pratiques, and delivered there in succession courses on the Babylonian myths and the Book of Genesis; the Gospel parables; the narrative of the ministry in the synoptic Gospels; and the Passion narratives in the same. The first course was published in the Revue d’histoire et de littérature religieuses; and here also appeared instalments of his commentary on St John’s Gospel, his critically important Notes sur la Genèse, and a Chronique biblique unmatched in its mastery of its numberless subjects and its fearless yet delicate penetration.

It was, however, two less erudite little books that brought him a European literary reputation and the culmination of his ecclesiastical troubles. L’Évangile et l’église appeared in November 1902 (Eng. trans., 1903). Its introduction and six chapters present with rare lucidity the earliest conceptions of the Kingdom of Heaven, the Son of God, the Church, Christian dogma and Catholic worship; and together form a severely critical-historical yet strongly Catholic answer to Harnack’s still largely pleitistic Wand der Christentums. It develops throughout the principles that “what is essential in Jesus’ Gospel is what occupies the first and last place in His authentic teaching, the ideas for
which He fought and died, and not only that idea which we may consider to be still a living force to-day;" that "it is supremely arbitrary to decree that Christianity must be essentially what the Gospel did not borrow from Judaism, as though what the Gospel owes to Judaism were necessarily of secondary worth"; that "whether we trust or distrust tradition, we know Christ only by means of, athwart and within the Christian tradition"; that "the essence of Christianity resides in the fulness and totality of its life"; and that "the adaptation of the Gospel to the changing conditions of humanity is to-day a more pressing need than ever." The second edition was enlarged by a preliminary chapter on the sources of the Gospels, and by a third section for the Son of God chapter. The little book promptly aroused widespread interest, some cordial sympathy and much vehement opposition; whilst its large companion the *Études ecclésiologiques*, containing the course on the parables and four sections of his coming commentary on the Fourth Gospel, passed almost unnoticed. On the 21st of January 1903 Cardinal Richard publicly condemned the book, as not furnished with an *imprimatur*, and as calculated gravely to trouble the faith of the faithful in the fundamental Catholic dogmas. On the 2nd of February Loisy wrote to the archbishop: "I condemn, as a matter of course, all the errors which men have been able to deduce from my book, by placing themselves in interpreting it at a point of view entirely different from that which I had to occupy in composing it." The pope refused to interfere directly, and the nuncio, Mgr Lorenzelli, failed in securing more than ten public adhesions to the cardinal's condemnation from among the eighty bishops of France.

Pope Leo had indeed, in a letter to the Franciscan minister-general (November 1898), and in an encyclical to the French clergy (September 1899), vigorously emphasized the traditionalist principles of his encyclical *Ponentissimus* of 1893; he had even, much to his prompt regret, signed the unfortunate decree of the Roman Inquisition, January 1897, prohibiting all doubt as to the authenticity of the "Three Heavenly Witnesses" passage, 1 John v. 7, a text which, in the wake of a line of scholars from Erasmus downwards, Abbé Paulin Martin had, in 1887, exhaustively shown to be no older than the end of the 4th century A.D. Yet in October 1902 he established a "Commission for the Progress of Biblical Studies," preponderantly composed of seriously critical scholars; and even one month before his death he still refused to sign a condemnation of Loisy's *Études ecclésiologiques*.

Cardinal Sarto became Pope Pius X. on the 4th of August 1903. On the 1st of October Loisy published three new books, *Le Quatrième Évangile de Léon III, Le Discours sur la Montagne*, and *Le Souverain*; *Le Souverain* consists of seven letters, on the origin and aim of L'Évangile et l'Église; on the biblical question; the criticism of the Gospels; the Divinity of Christ; the Church's foundation and authority; the origin and authority of dogma, and on the institution of the sacraments. The second and third, addressed respectively to a cardinal (Perraud) and a bishop (Le Camus), are polemical or ironical in tone; the others are all written to friends in a warm, expansive mood; the fourth letter especially, appropriated to Mgr Mignot, attains a great elevation of thought and depth of mystical conviction. *Le Quatrième Évangile*, one thousand large pages long, is necessarily over-confident in its detailed application of the allegorical method; yet it constitutes a rarely perfect sympathetic reproduction of a great mystical believer's imperishable intuitions. *Le Discours sur la Montagne* is a fragment of a coming enlarged commentary on the synoptic Gospels. On the 23rd of December the pope ordered the publication of a decree of the Congregation of the Index, incorporating a decree of the Inquisition, condemning Loisy's *Religion d'Israël, L'Évangile et l'Église, Études ecclésiologiques, Autour d'un petit livre* and *Le Quatrième Évangile*. The pope's secretary of state had on the 19th December, in a letter to Cardinal Richard, recounted the causes of the condemnation in the identical terms used by the latter himself when condemning the *Religion d'Israël* three years before. On the 12th of January 1904 Loisy wrote to Cardinal Merry del Val that he received the condemnation with respect, and condemned whatever might be reprehensible in his books, whilst reserving the rights of his conscience and his opinions as an historian, opinions doubtless imperfect, as no one was more ready to admit than himself, but which were the only form under which he was able to represent to himself the history of the Bible and of religion. Since the Holy See was not satisfied, Loisy sent three further declarations to Rome; the last, despatched on the 17th of March, was addressed to the pope himself, and remained unanswered. And at the end of March Loisy gave up his lectureship, as he declared, "on his own initiative, in view of the pacification of minds in the Catholic Church." In the July following he moved into a little house, built for him by his pupil and friend, the Assyriologist François Thureau Dangin, within the latter's park at Garnay, by Dreux. Here he continued his important reviews, notably in the *Revue d'histoire et de littérature religieuses*, and published *Morceaux d'exégèse* (1906), six further sections of his synoptic commentary. In April 1907 he returned to his native Lorraine, to Céfonds by Montier-en-Der, and to his relatives there.

Five recent Roman decisions are doubtless aimed primarily at Loisy's teaching. The Biblical Commission, soon enlarged so as to swamp the original critical members, and which had become the simple mouthpiece of its presiding cardinals, issued two decrees. The first, on the 27th of June 1906, affirmed, with some significant but unworkable reservations, the Mosaic authorship of the Pentateuch; and the second (20th of May 1907) strenuously maintained the Apostolic Zebedean authorship of the Fourth Gospel, and the strictly historical character of the events and speeches recorded therein. The Inquisition, by its decree *Lamentabili sane* (2nd of July 1907), condemned sixty-five propositions concerning the Church's magisterium; biblical inspiration and interpretation; the synoptic and fourth Gospels; revelation and dogma; Christ's divinity, human knowledge and resurrection; and the historical origin and growth of the Sacraments, the Church and the Creed. And some forty of these propositions represent, more or less accurately, certain sentences or ideas of Loisy, when torn from their context and their reasons. The encyclical *Paschendi Dominici Gregis* (Sept. 6th, 1907), probably the longest and most argumentative papal utterance extant, also aims primarily at Loisy, although here the vehemently scholastic redactor's determination to piece together a strictly coherent, complete a priori system of "Modernism" and his self-imposed restriction to medieval categories of thought as the vehicles for describing essentially modern discoveries and requirements of mind, make the identifiability of his opinions and passages very difficult. And the last decree, on the 21st of November 1907 a papal *motu proprio* declared all the decisions of the Biblical Commission, past and future, to be as binding upon the conscience as decrees of the Roman Congregations.

Yet even all this did not deter Loisy from publishing three further books. *Les Évangiles synoptiques*, two large 8vo volumes of 1099 and 798 pages, appeared "chez l'auteur, à Céfonds, Montier-en-Der, Haute-Marne," in January 1908. An incisive introduction discusses the ecclesiastical tradition, modern criticism; the second, the first and the third Gospels; the evangelical tradition; the career and the teaching of Jesus; and the literary form, the tradition of the text and the previous commentaries. The commentary gives also a careful translation of the texts. Loisy recognizes two eye-witness documents, as utilized by all three synoptists, while Matthew and Luke have also incorporated Mark. His chief peculiarity consists in clearly tracing a strong Pauline influence, especially in Mark, which there remodels certain sayings and actions as these were first registered by the eye-witness documents. These doctrinal interpretations introduce the economy of blinding the Jews into the parabolic teaching; the declaration as to the redemptive character of the Passion into the sayings; the sacramental, institutional words into the account of the Last Supper, originally, a solemnly simple Messianic meal; and the formal night-trial before Caiphas into the original Passion-story with its informal, morning
discuss the relations between faith and the affirmation of phenomenal happenings; Paul Sabatier, "Les Derniers Ouvrages de l'Abbe Loisy," in the Revue chrétienne (Dôle, 1904) and Paul Desjardins' Catholicisme et critique (Paris, 1903), a Broad Church Protestant's

discussion of the socialistic and agnostic tendencies of the Revue des Évangiles synoptiques by the Abbé Mangenot, in Revue du Clergé français (Feb. 15, 1908) containing some interesting discriminations; a revue by L. in the Revue biblique (1908), pp. 608-620, a criticism of the fair insinuation and unfairgeries of thephemeral admissions; and a paper by G. P. B. and Jacques Chevalier in the Annales de philosophie chrétienne (Paris, Jan., 1909) seeks to trace and to refute certain philosophical presuppositions at work in the discussion, especially the method of the Hamburger "Kreuzchristentum," and the Institution of the Church. Italy: "Lettres Romaines" in Annales de philosophie chrétienne (Paris, January, 1904), a talk with the ancient and the present, and an explanation of the Church, 16, pp. xxvii, 268, 1908, a

The Church authorities were this time not slow to act. On the 14th of February Mgr. Amette, the new archbishop of Paris, prohibited his diocesans to read or defend the two books, which "attack and deny several fundamental dogmas of Christianity," under pain of excommunication. The abbé again declared "it is impossible for me honestly and sincerely to make the act of absolute retraction and submission exactly by the sovereign pontiff." And the Holy Office, on the 7th of March, pronounced the major excommunication against him. At the end of March Loisy published Quelques Lettres (December 1903—February 1908), which conclude: "At bottom I have remained in my last writings on the same line as in the earlier ones. I have aimed at establishing principally the historical position of the various questions, and secondarily the necessity for reforming more or less the traditional concepts."

The chief cause to appear jointly to have produced M. Loisy's very absolute condemnation, any frank recognition of the abbé's even general principles involves the abandonment of the identification of theology with scholasticism or even with specifically ancient thought in general. The abbé's central position, that our Lord himself held the proximateness of His second coming, involves the loss by churchmen of the prestige of directly divine power, since Church and Sacraments, though still the true fruits and vehicles of his life, death, and spirit, cannot thus be immediately founded by the earthly Jesus himself. And the Church policy, as old as the times of Constantine, to crush utterly the man who brings more problems and pressure than the bulk of traditional Christians can, at the time, either digest or resist with a fair discrimination, seemed to the authorities the one means to save the very difficult situation.

BIBLIOGRAPHY.—Autobiographical passages in M. Loisy's Auteur d'un vœu libre (Paris, 1903), and an account of his literary activity and ecclesiastical troubles will be found in Abbé Albert Houtin's La Question biblique au XIXe siècle (Paris, 2nd ed., 1902) and La Question biblique au XXe siècle (Paris, 1904), a vividly written account of the long and sad battles by the Church against the abbe, in addition to his important and scholarly want of religious feeling. The following articles and booklets concerning M. Loisy and the questions raised by him are specially remarkable: France: Père Durand, S. J., Études religieuses (Paris, 1901), a scientific and religious study of the Loisy. "Histoire et dogma," in La Quinzième (Paris January 16, February 16, 1904), F. de Hugel's "Du Christ éternel et des christologies successives" (ibid. June 1, 1904), the Abbé J. Wehrle's "Le Christ et la conscience catholique" (ibid. August 16, 1904) and F. de Hugel's "Correspondance" (ibid. Sept. 16, 1904)
LOKOJA, a town of Nigeria, at the junction of the Niger and Benue rivers, founded in 1660 by the British consul, W. B. Baikie, and subsequently a military centre of the Royal Niger Company. It is in the province of Kabba, 250 m. from the mouth of the Niger, and is of considerable commercial importance (see NIGERIA AND KABBA).

LOLLARDS, the name given to the English followers of John Wycliffe; they were the adherents of a religious movement which was widespread in the end of the 14th and beginning of the 15th centuries, and to some extent maintained itself on to the Reformation. The name is of uncertain origin; some derive it from *lollum*, tares, quoting Chaucer (C. T., Shipman's Prologue):—

"This Loller heer wil prechen us somewhat . . .

He wolde sowne som difficulte

Or trowe him in oure corne";

but the most generally received explanation derives the words from *lollus* or *lullus*, to sing softly. The word is much older than its English use; there were Lollards in the Netherlands at the beginning of the 14th century, who were akin to the Fraticellii, Beghards and other sectaries of the recusant Franciscan type. The earliest official use of the name in England occurs in 1387 in a mandate of the bishop of Worcester against five "poor preachers," *nomine seu rito Lollardorum confederatos*. It is probable that the name was given to the followers of Wycliffe because they resembled those offshoots from the great Franciscan movement which had disowned the pope's authority and set before themselves the ideal of *Evangelical poverty*.

The 14th century, so full of varied religious life, made it manifest that the two different ideas of a life of separation from the world which in earlier times had lived on side by side within the medieval church were irreconcilable. The church chose to abide by the idea of Hildebrand and to reject that of Francis of Assisi; and the revolt of Ockham and the Franciscans, of the Beghards and other spiritual fraternities, of Wycliffe and the Lollards, were all protests against that decision. Gradually there came to be facing each other a great political Christendom, whose rulers were statesmen, with aims and policy of a worldly type, and a religious Christendom, full of the ideas of separation from the world by self-sacrifice and of participation in the benefits of Christ's work by an ascetic imitation. The war between the two ideals was fought out in almost every country in Europe in the 14th century. In England Wycliffe's whole life was spent in the struggle, and he succeeded in making the Lollards a party in politics. The idea most closely thought with Wycliffe was that the church, if true to her divine mission, must aid men to live that life of evangelical poverty by which they could be separate from the world and imitate Christ, and if the church ceased to be true to her mission she ceased to be a church. Wycliffe was a metaphysician and a theologian, and had to invent a metaphysical theory—the theory of *Dominium*—to enable him to transfer, in a way satisfactory to himself, the powers and privileges of the church to his company of poor Christians; but his followers were content to allege that a church which held large landed possessions, collected tithes greedily and took money from starving peasants for baptizing, burying and praying, could not be the church of Christ and his apostles.

Lollardism was most dangerous of all at the eve of the ecclesiastical organization of England during the ten years after Wycliffe's death. It had spread so rapidly and grown so popular that a hostile chronicler could say that almost every second man was a Lollard. Wycliffe left three intimate disciples:—Nicolas Hereford, a doctor of theology of Oxford, who had helped his master to translate the Bible into English; John Ashton, also a fellow of an Oxford college; and John Purvey, Wycliffe's colleague at Lutterworth, and a co-translator of the Bible. With these were associated more or less intimately, in the first age of Lollardy, John Parker, the strange ascetic William Smith, the restless fanatic Swynderly, Richard Wayst-tract and Crompe. Wycliffe had organized in Lutterworth an association for sending the gospel through all England, a company of poor preachers somewhat after the Weslyan method of modern times. "To be poor without mendicancy, to unite the flexible unity, the swift obedience of an order, with free and constant mingling among the poor, such was the ideal of Wycliffe's 'poor priests'" (cf. Shirley, *Fasc. Zia*, p. xl.), and, although proscribed, these "poor preachers" with portions of their master's translation of the Bible in their hand to guide them, preached all over England. In 1382, two years before the death of Wycliffe, the archbishop of Canterbury got the Lollard opinions condemned by convocation, and, having been promised royal support, he began the long conflict of the church with the followers of Wycliffe. He was able to coerce the authorities of the university of Oxford, and to drive out of it the leading Wyclifite teachers, but he was unable to stifle Oxford sympathies or to prevent the banished teachers preaching throughout the country. Many of the nobles, like Lords Montague and Scrope, supported the church preachers, took them to Croydon chapels, and protected them against clerical interference. Country gentlemen like Sir Thomas Latimer of Braybrooke and Sir Richard Stury protected them, while merchants and burgesses supported them with money. When Richard II. issued an ordinance (July 1382) ordering every bishop to arrest all Lollards, the Commons compelled him to withdraw it. Thus protected, the "poor preachers" won masses of the people to their opinions, and Leicester, London and the west of England became their headquarters.

The organization must have been strong in numbers, but only those who were seized for heresy are known by name, and it is only from the indictments of their accusers that their opinions can be gathered. The preachers were picturesque figures in long robes, and wearing hoods; they grasped the mother tongue to the people in churches and graveyards, in squares, streets and houses, in gardens and pleasure grounds, and then talked privately with those who had been impressed. The Lollard literature was very widely circulated—books by Wycliffe and Hereford and tracts and broadsides—in spite of many edicts proscribing it. In 1395 the Lollards grew so strong that they petitioned parliament through Sir Thomas Latimer and Sir R. Stury to reform the church on Lollardist methods. It is said that the Lollard Conclusions printed by Canon Shirley (p. 360) contain the substance of this petition. If so, parliament was told that temporal possessions ruin the church and drive out the Christian graces of faith, hope and charity; that the priesthood of the church in communion with Rome was false; that the church made Christ a liar; that the church's vow of celibacy had for its consequence unnatural lust, and should not be imposed; that transubstantiation was a feigned miracle, and led people to idolatry; that prayers made over wine, bread, water, oil, salt, wax, incense, altars of stone, church walls, vestments, mitres, crosses, staves, were magical and should not be allowed; that kings should possess the *jus episcopale*, and bring good government into the church; that no special prayers should be made for the dead; that auricular confession made to the clergy, and declared to be necessary for salvation, was the root of clerical arrogance and the cause of indulgences and other abuses in pardoning sin; that all wars were against the principles of the New Testament, and were but murdering and plundering the poor to win glory for kings; that the doctrine of purgatory was false; that that which is practiced in the commonwealth, such as those of goldsmiths and armourers, were unnecessary and led to luxury and waste. These Conclusions really contain the sum of Wyclifite teaching; and, if we add that the principal duty of priests is to preach, and that the worship of images, the going on pilgrimages and the use of gold and silver chalices in divine service are sinful (*The Peasants' Rising and the Lollards*, p. 47), they include almost all the heresies charged in the indictments against individual Lollards down to the middle of the 15th century. The king, who had hitherto seemed anxious to repress the action of the clergy against the Lollards, spoke strongly against the petition and its promoters, and Lollardy never again had the power in England which it wielded up to this year.

If the formal statements of Lollard creed are to be got from these Conclusions, the popular view of their controversy with...
LOLLARDS

The archbishop, having the power of the throne behind him, attacked that stronghold of Lollardy the university of Oxford. In 1406 a document appeared purporting to be the testimony of the university in favour of Wycliffe; its genuineness was disputed at the time, and when quoted by Huss at the council of Constance it was repudiated by the English delegates. The archbishop treated Oxford as if it had issued the document, and procured the issue of severe regulations in order to purge the university of heresy. In 1408 Arundel in convocation proposed and carried the famous Constitutiones Thomae Arundel intendeD to put down Wycliffite preaching and teaching. They provided among other things that no one was to be allowed to preach without a bishop’s licence, that preachers preaching to the laity were not to rebuke the sins of the clergy, and that Lollard books and the translation of the Bible were to be searched for and destroyed.

When Henry V. became king a more determined effort was made to crush Lollardy. Hitherto its strength had lain among the country gentlemen who were the representatives of the shires. The court and clergy had been afraid to attack this powerful class. The new king determined to overawe them, and to this end selected one who had been a personal friend and whose life had been blameless. This was Sir John Oldcastle, in right of his wife, Lord Cobham, “the good Lord Cobham” as the dissenter called him. Henry first tried personal persuasion, and when that failed directed trial for heresy. Oldcastle was convicted, but was imprisoned for forty days in the Tower in hope that he might recant. He escaped, and summoned his co-religionists to his aid. A Lollard plot was formed to seize the king’s person. In the end Oldcastle was burnt for an obstinate heretic (Dec. 1417). These persecutions were not greatly protested against; the wars of Henry V. with France had awakened the martial spirit of the nation, and little sympathy was felt for men who had declared that all war was but the murder and plundering of poor people for the sake of kings. Making ballads were composed upon the martyr Oldcastle, and this dislike to warfare was one of the chief accusations made against him (comp. Wright’s Political Poems, ii. 244). But Arundel could not prevent the writing and distribution of Lollard books and pamphlets. Two appeared about the time of the martyrdom of Oldcastle—The Ploughman’s Prayer and the Lanthorne of Light. The Ploughman’s Prayer declared that true worship consists in three things—in loving God, and dreading God and trusting in God above all other things; and it showed how Lollards, pressed by persecution, became further separated from the religious life of the church. “Men maketh now great stoned houses full of glasen windows, and clepeth thilke nine houses and churches. And they setten in these houses many metes and markes, and staken in it by the prince of Wales, who himselfe tried to reason the Lollard out of his convictions. But nothing said would make Badby confess that “Christ sitting at supper did give to His disciplyes His living body to eat.” The Lollards, far from daunted, abated no effort to make good their ground, and united a struggle for social and political liberty to the hatred felt by the peasants towards the Romish clergy. Jak Upland (John Countryman) took the place of Piers Ploughman, and upbraided the clergy, and especially the friars, for their wealth and luxury. Wycliffe had published the rule of St. Francis, and had pointed out in a commentary upon the rule how friars had departed from the maxims of their founder, and had persecuted the Spirituals (the Fraticelli, Beghards, Lollards of the Netherlands) for keeping them to the letter (cf. Matthews, English Works of Wyclif hitherto unprinted, Early Eng. Text Soc., vol. lxxiv., 1880). Jak Upland put all this into rude nervous English verse:

"Ffre, what charitie is this
To laven that whose liveth after your order
Liveth most perfecte,
And next followeth the state of the Apostles
In profession and pencepe:
And yet the wisest and greatest clerkes of oure
Wend or send or procure to the court of Rome,
... and to be assailed of the vow of poverty."
in the statement of their doctrines. Thomas Bagley was accused of declaring that if in the sacrament a priest made bread into God, he made God that can be eaten by rats and mice; that the pharisees of the day, the monks, and the nuns, and the friars and all other privileged persons recognized by the church were limbs of Satan; and that auricular confession to the priest was the will not of God but of the devil. And others held that any priest who took salary was excommunicate; and that bread could be used as well as priests.

From England Lollardy passed into Scotland. Oxford infected St Andrews, and we find traces of more than one vigorous search made for Lollards among the teaching staff of the Scottish university, while the Lollards of Kyle in Ayrshire were claimed by Knox as the forerunners of the Scotch Reformation.

The opinion of the later Lollards can best be gathered from the learned and unfortunate Pecock, who wrote his elaborate Repressor against the "Bible-men," as he calls them. He summed up their doctrines under eleven heads: they condemn the having and using in the churches, the going on pilgrimages to the memorial or mythical places of the saints, the holding of landed possessions by the clergy, the various ranks of the hierarchy, the framing of ecclesiastical laws and ordinances by papal and episcopal authority, the institution of religious orders, the costliness of ecclesiastical decorations, the ceremonies of the mass and the sacraments, the taking of vows, and the maintenance of monastic and conventual observance is unlawful. When these points are compared with the Lollard Conclusions of 1395, it is plain that Lollardy had not greatly altered its opinions after fifty-five years of persecution. All the articles of Pecock are found in the Conclusions; and, although many writers have held that Wycliffe's own views differed greatly from what have been called the "exaggerations of the later and more violent Lollards," all those at which Wycliffe was so much assailed by the orthodox Latins were said to be "mean and unworthy," and the disciples of Wycliffe, the Lollards, "esteemed the Law, the Gospels, the Sacraments, and the Church," as "an old and corrupt establishment that had come to be corrupt and illegal." It is clear that Wycliffe had no desire to "abolish the Church," but to reform it from within; and the Lollards, in their phrase, "to turn the Church towards the everlasting Kingdom." The Lollards were thus distinguished from the Anabaptists and other extreme reformers who desired to break away entirely from the Church of Rome. The Lollards were content to wait for the coming of the Kingdom of the Son of Man, and to work out the redemption of the world through the grace of God, and the power of the Holy Spirit, and the preaching of the gospel, and the establishment of the kingdom of God on earth, and the salvation of all mankind. The Lollards were thus distinguished from the Anabaptists and other extreme reformers who desired to break away entirely from the Church of Rome. The Lollards were content to wait for the coming of the Kingdom of the Son of Man, and to work out the redemption of the world through the grace of God, and the power of the Holy Spirit, and the preaching of the gospel, and the establishment of the kingdom of God on earth, and the salvation of all mankind.

LOLLIUS—LOMBARD LEAGUE

LOLLIUS, MARCUS, Roman general, the first governor of Galatia (25 B.C.), consul in 11. In 16, when governor of Gaul, he was defeated by the Sigambri (Sygambri), Usipetes and Tencteri, German tribes who had crossed the Rhine. This defeat is coupled with Tacitus with the disaster of Varus, but it was disgraceful rather than dangerous. Lullius was subsequently (2 B.C.) attached to the capacity of tutor and adviser to Galus Caesar (Augustus's grandson) on his mission to the East. He was accused of extortion and treachery to the state, and denounced by Galus to the emperor. To avoid punishment he is said to have taken poison. According to Velius Paterculus and Pliny, he was a hypocrite and cared for nothing but amassing wealth. It was formerly thought that this was the Lullius whom Horace described as a model of integrity and superior to all others in the age. He was a man of great learning and skill in the arts, and was a great admirer of Cicero. He was the author of a number of works on astronomy, mathematics, and the natural sciences, and is said to have been the first to introduce the use of the astrolabe.

LOLOGS, the name given by the Chinese to a large tribe of aborigines who inhabit the greater part of southern Szechuan. Their home is in the country south of the river called Taliang shan, and they are found on the banks of the Yangtsze river or on its tributaries between the Kansu and the ch'ang valley on the west, in south Szechuan, but they are scattered in scattered communities as far south as the Burmese frontier, and west to the Mekong. There seems no reason to doubt that they were, like the Miao, one of the aboriginal tribes of China, driven southwards by the advancing flood of Chinese. The name is said to be a Chinese corruption of Lulo, the name of a former chieftain of a tribe who called themselves Nersu. Their language, like the Chinese, is monosyllabic and probably ideographic, and the characters bear a certain resemblance to Chinese. No literature, however, worthy of the name is known to exist, and few can read and write. Politically they are divided into tribes, each under the government of a hereditary chieftain. The community consists of three classes, the "blackguards" or nobles, the "whitebones" or plebeians, and the water or slaves. The last are mostly Chinese captured as captives, or the descendants of such captives. Within Lolo-land proper, which covers some 11,000 sq. m., the Chinese government exercises no jurisdiction. The Lolo make frequent raids on their unarmed Chinese neighbours. They cultivate wheat, barley and millet, but little rice. They have some knowledge of metals, making their own tools and weapons. Women are said to be held in respect, and may become chief of the tribes. They do not intermarry with Chinese.

LOMBARD LEAGUE, the name given in general to any league of the cities of Lombardy, but applied especially to the league founded in 1167, which brought about the defeat of the emperor Frederick I. at Legnano, and the consequent destruction of his plans for obtaining complete authority over Italy.

Lacking often the protection of a strong ruler, the Lombard cities had been accustomed to act together for mutual defence, until 1193 Milan, Lod, Placentia and Cremona formed an alliance against the emperor Henry I. in favour of his rebellious son Conrad. The early years of the reign of Frederick I. were largely spent in attacks on the privileges of the cities of Lombardy. This led to a coalition, formed in March 1167, between the cities of Cremona, Mantua, Bergamo and Brescia to confine Frederick to the rights which the emperors had enjoyed for the past hundred years. This league or concordia was soon joined by other cities, among which were Milan, Parma, Padua, Verona, Piacenza and Bologna, and the allies began to build a fortress near the confluence of the Tanaro and the
Bormida, which, in honour of Pope Alexander III., was called Alessandria. During the absence of Frederick from Italy from 1168 to 1174, the relations between the pope and the league became cooler, and Alexander became the leader of the alliance. Meetings of the league were held in 1172 and 1173 to strengthen the bond, and to concert measures against the emperor, the penalties of the church being invoked to prevent defection. The decisive struggle began when Frederick attacked Alessandria in 1174. The fortress was bravely defended, and the siege was raised on the approach of succour from the allied cities. Negotiations for peace failed, and the emperor, having marched against Milan, suffered a severe defeat at Legnano on the 26th of May 1176. Subsequently Pope Alexander was detached from his allies, and made peace with Frederick, after which a truce for six years was arranged between the emperor and the league. Further negotiations ripened into the peace of Constance signed on the 25th of June 1183, which granted almost all the demands of the cities, and left only a shadowy authority to the emperor (see ITALY).

In 1219, when the emperor Frederick II. avowed his intention of restoring the imperial authority in Italy, the league was renewed, and at once fifteen cities, including Milan and Verona, were placed under the ban. Frederick, however, was not in a position to fight, and the mediation of Pope Honorius III. was successful in restoring peace. In 1231 the hostile intentions of the emperor once more stirred the cities into activity. They held a meeting at Bologna and raised an army, but as in 1226, the matter ended in mutual fulminations and defiance. A more serious conflict arose in 1234. The great question at issue, the nature and extent of the imperial authority over the Lombard cities, was still unsettled when Frederick's rebellious son, the German king Henry VII., allied himself with them. Having crushed his son and rejected the proffered mediation of Pope Gregory IX., the emperor declared war on the Lombards in 1236; he inflicted a serious defeat upon their forces at Cortenuova in November 1237 and met with other successes, but in 1238 he was beaten back from before Brescia. In 1239 Pope Gregory joined the cities and the struggle widened out into the larger one of the Empire and the Papacy. This was still proceeding when Frederick died in December 1250 and it was only ended by the overthrow of the Hohenstaufen and the complete destruction of the imperial authority in Italy.

For a full account of the Lombard League see C. Vignati, Storia diplomatica della Lega Lombarda (Milan, 1866); H. Pruts, Kaiser Friedrich I., Band ii. (Danzig, 1871-1874); W. von Gopffrange, Geschichtliche Kaiserchronik aus dem Geschichtsarchiv zu Cividale (Leipzig, 1888); and J. Ficker, Zur Geschichte des Lombardenbundes (Vienna, 1868).

Lombardo, the name of a family of Venetian architects and sculptors; their surname was apparently Solaro, and the name of Lombardo was given to the earliest known, Martino, who emigrated from Lombardy to Venice in the middle of the 15th century and became celebrated as an architect. He had two sons, Moro and Pietro, of whom the latter (c. 1435-1515) was one of the greatest sculptors and architects of his time, while his sons Antonio (d. 1516) and Tullio (d. 1559) were hardly less celebrated. Pietro's work as an architect is seen in numerous churches, the Vendramini-Calargi palace (1458), the doge's palace (1498), the façade (1458) of the sanctuary of the protecting and the cathedral of Cividale, and Bellinzoni (1502); but he is now most famous for the pilches, often in collaboration with his sons, he executed the tomb of the doge Mocenigo (1478) in the church of San Giovanni e Paolo at Venice, and a bas-relief for the tomb of Dante at Ravenna, and in 1483 began the beautiful decorations in the church of Sta Maria de' Miracoli at Venice, which is associated with his workshop (see also Venice for numerous references to the work of the Lombardi). Antonio's masterpiece is the marble relief of St Anthony making a new-born child speak in defence of its mother's honour, in the Santo at Padua (1505). Tullio's best-known works are the four kneeling angels (1484) in the church of San Martino, Venice, a coronation of the Virgin in San Giovanni Crisostomo and two bas-reliefs in the Santo, Padua, besides two others formerly in the Spitzer collection, representing Vulcan's Forge and Minerva disputing with Neptune.

Lombards, or Langobardi, a Suevic people who appear to have inhabited the lower basin of the Elbe and whose name is believed to survive in the modern Bardengau to the south of Hamburg. They are first mentioned in connexion with the year A.D. 5, at which time they were defeated by the Romans under Tiberius, afterwards emperor. In A.D. 9, however, after the destruction of Varus's army, the Romans gave up their attempt to extend their frontier to the Elbe. At first, with most of the Suevic tribes, they were subject to the hegemony of Maroboduus, king of the Marcomanni, but they revolted from him in his war with Arminius, chief of the Cherusci, in the year 17. We again hear of their interference in the dynastic strife of the Cherusci some time after the year 47. From this time they are not mentioned until the year 195, when a force of Langobardi, in alliance with the Marcomanni, was defeated by the Romans, apparently on the Danubian frontier. It has been inferred from this incident that the Langobardi had already moved southwards, but the force mentioned may very well have been sent from the old home of the tribe, as the various Suevic peoples seem generally to have preserved some form of political union. From this time onwards we hear no more of them until the end of the 5th century.

In their own traditions we are told that the Langobardi were originally called Winnili and dwelt in an island named ScadNAVIA (with this story compare that of the Gothic migration, see GOTHs). Thence they set out under the leadership of Ibor and Aio, the sons of a prophetess called Gambara, and came into conflict with the Vandals. The leaders of the latter prayed to Wodan for victory, while Gambara and her sons invoked Freo. Wodan promised to give victory to those whom he should see in front of him at sunrise. Frea directed the Winnilli to bring their women with their hair let down round their faces like beards and turned Wodan's couch round so that he faced them. When Wodan awoke at sunrise he saw the host of the Winnilli and said, "Quis sunt tisi Langobardi?"—"Who are these long-beards?"—and Frea replied, "As thou hast given them the name, give them also the victory." They conquered in the battle and were thenceforth known as Langobardi. After this they are said to have wandered through regions which cannot now be identified, apparently between the Elbe and the Oder, under legendary kings, the first of whom was Agilulf, the son of Aio.

Shortly before the end of the 5th century the Langobardi appear to have taken possession of the territories formerly occupied by the Rugi whom Odoacer had overthrown in 489, a region which probably included the present province of Lower Austria. At this time they were subject to Rodulf, king of the Heruli, who, however, took up arms against them; according to one story, owing to the treacherous murder of Rodulf's brother, according to another through an irresistible desire for fighting on the part of his men. The result was the total defeat of the Heruli by the Langobardi under their king Tato and the death of Rodulf at Cividale in the year 490. By this time the Langobardi are said to have adopted Christianity in its Arian form. Tato was subsequently killed by his nephew Waccho. The latter reigned for thirty years, though frequent attempts were made by Ilidichis, a son or grandson of Tato, to recover the throne. Waccho is said to have conquered the Suabi, possibly the Bavarians, and he was also involved in strife with the Gepidae, with whom Ilidichis had taken refuge. He was succeeded by his youthful son Walthari, who reigned only seven years under the guardianship of a certain Auboh. On Walthari's death (about 546?) Auboh succeeded. He also was involved in hostilities against the Gepidae, whose support of Ilidichis he repaid by protecting Ostrogothus, a rival of their king Thorisind. In these quarrels both nations aimed at obtaining the support of the emperor Justinian, who, in pursuance of his policy of playing off one against the other, invited the Langobardi into Noricum and Pannonia, where they now settled.

A large force of Lombards under Auboh fought on the imperial side at the battle of the Apennines against the Ostrogothic king
Totila in 553, but the assistance of Justinian, though often promised, had no effect on the relations of the two nations, which were settled for the moment after a series of truces by the victory of the Langobardi, probably in 554. The resulting peace was sealed by the murder of Ildichis and Ustrgothus, and the Langobardi seem to have continued inactive until the death of Audoin, perhaps in 565, and the accession of his son Alboin, who had won a great reputation in the wars with the Gepidae. It was about this time that the Avars, under their first Chagun Baian, entered Europe, and with them Alboin is said to have made an alliance against the Gepidae under their new king Cunimund. The Avars, however, did not take part in the final battle, in which the Langobardi were completely victorious. Alboin, who had slain Cunimund in the battle, now took Rosamund, daughter of the dead king, and his wife Bertha.

In 568 Alboin and the Langobardi, in accordance with a compact made with Baian, which is recorded by Menander, abandoned their old homes to the Avars and passed southwards into Italy, were they were destined to found a new and mighty kingdom.

The Lombard Kingdom in Italy.—In 568 Alboin, king of the Lombards, with the women and children of the tribe and all their possessions, with Saxon allies, with the subject tribe of the Gepidae and a mixed host of other barbarians, descended into Italy by the great plain at the head of the Adriatic. The war which had ended in the downfall of the Goths had exhausted Italy; it was followed by famine and pestilence; and the government at Constantinople made but faint efforts to retain the territories it had conquered. The Lombards, like the Franks, had been converted to Christianity; they had not, however, been trained for war, and it was possible to resist them. Except in a few fortified places, such as Ticinum or Pavia, the Italians did not venture to encounter the new invaders; and, though Alboin was not without generosity, the Lombards, wherever resisted, justified the opinion of their ferocity by the savage cruelty of the invasion. In 572, according to the Lombard chronicler, Alboin fell a victim to the revenge of his wife Rosamund, the daughter of the king of the Gepidae, whose skull Alboin had turned into a drinking cup, out of which he forced Rosamund to drink. By this time the Langobardi had established themselves in the north of Italy. Chiefs were placed, or placed themselves, first in the border cities, like Friuli and Trent, which commanded the north-eastern passes, and then in other principal places; and this arrangement became characteristic of the Lombard settlements. The principal city of the new kingdom was the rich plain watered by the Po and its affluents, which was in future to receive its name from them; but their power extended across the Apennines into Liguria and Tuscany, and then southwards to the outlying dukedoms of Spoleto and Benevento. The invaders failed to secure any maritime ports or any territory that was conveniently commanded from the sea. Ticinum (Pavia), the one place which had obstinately resisted Alboin, became the seat of their kings.

After the short and cruel reign of Cleph, the successor of Alboin, the Lombards (as we may begin for convenience sake to call them) tried for ten years the experiment of a national confederacy of their dukes (as, after the Latin writers, their chieftains are styled), but this ended in the rise of private or thirty-five or thirty-six petty tyrants, under whose oppression and private wars even the invaders suffered. With anarchy among themselves and so precarious a hold on the country, hated by the Italian population and by the Catholic clergy, threatened also by an alliance of the Greek empire with their persistent rivals the Franks beyond the Alps, they resolved to sacrifice their independence and elect a king. In 584 they chose Authari, the grandson of Alboin, and endowed the royal domain with a half of their possessions. From this time till the fall of the Lombard power before the arms of their rivals the Franks under Charles the Great, the kingly rule continued. Authari, "the Long-haired," with his Roman title of Flavius, marks the change from the barbarian to the Roman; he was representative of the unity and law of the nation, and the increased power of the crown, by the possession of a great domain, to enforce its will. The independence of the dukes was surrendered to the king. The dukedoms in the neighbourhood of the seat of power were gradually absorbed, and their holders transformed into royal officers. Those of the northern marches, Trent and Friuli, with the important dukedom of Turin, retained longer the kind of independence which marchlands usually give where invasion is to be feared. The great dukedom of Benevento in the south, with its neighbour Spoleto, threatened at one time to be a separate principality, and even to the last resisted, with varying success, the full claims of the royal authority at Pavia.

The kingdom of the Lombards lasted more than two hundred years, from Alboin (568) to the fall of Desiderius (744)—much longer than the preceding Teutonic kingdoms of Theodoric and the Goths. But it differed from the other Teutonic conquests in Gaul, in Britain, in Spain. It was never complete in point of the provinces—like them, consisting of three, or at least four, capitals—the Lombard one, Pavia; the Latin one, Rome; the Greek one, Ravenna; and the Lombards never could get access to the sea. And it never was complete over the subject race: it profoundly affected the Italians of the north; in its turn it was entirely transformed by contact with them; but the Lombards never amalgamated with the Italians till their power as a ruling race was crushed by the victory given to the Roman element by the restored empire of the Franks. The Langobardi, German in their faults and in their strength, but coarser, at least at first, than the Germans whom the Italians had known, the Goths of Theodoric and Totila, found themselves continually in the presence of a subject population very different from anything which the other Teutonic conquerors met with among the provincials—like them, exhausted by the wars and the devastation, but with the remains and memory of a great civilization round them, intelligent, subtle, sensitive, feeling themselves infinitely superior in experience and knowledge to the rough barbarians whom they could not fight, and capable of hatred such as only cultivated races can nourish. The Lombards who, after they had occupied the lands and cities of Upper Italy, still went on sending forth furious bands to plunder and destroy where they did not care to stay, never were able to overcome the mingled fear and scorn and loathing of the Italians. They adapted themselves very quickly indeed to many Italian fashions. Within thirty years of the invasions, Authari took the imperial title of Flavius, even while his bands were leading Italian captives in leash like dogs under the walls of Rome, and under the eyes of Pope Gregory; and although the Lombard state was, at the time, it was retained by his successors. The Lombards became Catholics; and in all the usages of religion, in church building, in founding monasteries, in their veneration for relics, they vied with the Italians. Authari's queen, Theodelinda, solemnly placed the Lombard nation under the patronage of St John the Baptist, and at Monza she built in his honour the first Lombard church, and the royal palace near it. King Liutprand (712-744) bought the relics of St Augustine for a large sum to be placed in his church at Pavia. Their Teutonic speech disappeared; except in names and a few technical words all traces of it are lost. But to the last they had the unpardonable crime of being a ruling barbarian race or caste in Italy. To the end they were n'efandissimi, execrable, loathsome, filthy. So wrote John of Salisbury, who first appeared. So wrote Pope Stephen IV., at the end of their rule, when stirring up the king of the Franks to destroy them. Authari's short reign (584-591) was one of renewed effort for conquest. It brought the Lombards face to face, not merely with the emperors at Constantinople, but with the first of the great statesmen popes, Gregory the Great (590-604). But Lombard conquest was bungling and wasteful; when they had spoiled a city they proceeded to tear down its walls and raze it to the ground. Authari's chief connexion with the fortunes of his people was an important, though an accidental one. The Lombard chronicler tells a romantic tale of the way in which Authari sought his bride from Garibald, duke of the Bavarians, and that of his embassy to judge of her attractions, and how she recognized her disguised suitor. The bride was the Christian Theodelinda, and she became to the Langobards what Bertha was to the Anglo-Saxons and Clotilda to the Franks.
LOMBARDS

She became the mediator between the Lombards and the Catholic Church. Authari, who had brought her to Italy, died shortly after his marriage. But Thoedelinda had so won on the Lombard chiefs that they bid her as queen choose the one among them whom she would have for her husband and for king. She chose Agilulf, duke of Turin (592–615). He was not a true LANGOBARD, but a Thuringian. It was the beginning of peace between the Lombards and the Catholic clergy. Agilulf could not abandon his traditional Arianism, and he was a very uneasy neighbour, not only to the Greek exarch, but to Rome itself. But he was favourably disposed both to peace and to the Catholic Church. Gregory interfered to prevent a national conspiracy against the Langobards, like that of St Brice's day in England against the Danes, or that later uprising against the French, the Sicilian Vespers. He was right both in point of humanity and of policy. The Arian and Catholic bishops went on for a time side by side, but the Lombard kings and clergy rapidly yielded to the religious influences around them, even while the national antipathy continued unabated and vehement. Gregory, who despairs of any serious effort on the part of the Greek emperors to expel the Lombards, endeavoured to promote peace between the Italians and Agilulf; and, in spite of the feeble hostility of the exarchs of Ravenna, the pope and the king of the Lombards became the two real powers in the north and centre of Italy. Agilulf was followed, after two unimportant reigns, by his son-in-law, the husband of Thoedelinda's daughter, King Rothari (636–652), the Lombard legislator, still an Arian though he favoured the Catholics. He was the first of their kings who collected their customs under the name of laws—and he did this, not in their own Teutonic dialect, but in Latin. The use of Latin implies that the laws were to be not merely the personal law of the Lombards, but the law of the land, binding on Lombards and Romans alike. But such rude legislation could not provide for all questions arising even in the decayed state of Roman civil and ecclesiastical law. Some Lombard laws were therefore kept to their old usages and legal precedents where they were not overridden by the conquerors' law, and by degrees a good many of the Roman civil arrangements made their way into the Lombard code, while all ecclesiastical ones, and they were a large class, were untouched by it.

There must have been much change of property; but appearances are conflicting as to the terms on which land generally was held by the conquerors. On the one hand, there was the extremely liberal provision of Rothari (d. 652) to Liutprand (712–744) the Lombard kings, succeeding one another in the irregular fashion of the time, sometimes by descent, sometimes by election, sometimes by conspiracy and violence, to strive fitfully to enlarge their boundaries, and contended with the aristocracy of dukes inherent in the original organization of the nation, an element which, though much weakened, always remained the power of the crown, and checked the unity of the nation. Their old enemies the Franks were on the west, and the Slavs or Huns, ever ready to break in on the north-east, and sometimes called in by mutinous and traitorous dukes of Friuli and Trent, were constant and serious dangers. By the popes, who represented Italian interests, they were always looked upon with dislike and jealousy, even when they had become zealous Catholics, the founders of churches and monasteries; with the Greek empire there was chronic war. From time to time they made raids into the unsubdued parts of Italy, and added a city or two to their dominions. But there was no sustained effort for the complete subjugation of Italy till Liutprand, the most powerful of the line. He tried it, and failed. He broke up the independence of the great southern duchies, Benevento and Spoletto. For a time, in the heat of the dispute about images, he won, the pope to his side against the Greeks. For a time, but only for a time, he deprived the Greeks of Ravenna. Aistulf, his successor, carried on the same policy. He even threatened Rome itself, and claimed a capitulation tax. But the popes, thoroughly irritated and alarmed, and hopeless of aid from the East, turned to the family which was rising into power among the Franks of the West, the mayors of the palace of Austrasia. Pope Gregory III. applied in vain to Charles Martel. But with his successors Pippin and Charles the popes were more successful. In return for the transfer by the pope of the Frank crown from the decayed line of Clovis to his own, Pippin crossed the Alps, defeated Aistulf and gave to the pope the lands which Aistulf had torn from the empire, Ravenna and the Pentapolis (754–756). But the angry quarrels still went on between the popes and the Lombards. The Lombards were still to the Italians a "foul and horrid" race. At length, invited by Pope Adrian I., Pippin's son Charlemagne once more descended into Italy. As the Lombard kingdom began, so it ended, with a siege of Pavia. Desiderius, the last king, became a prisoner (774), and the Lombard power perished. Charlemagne, with the title of king of the Franks and Lombards, became master of Italy, and in 800 the pope, who had crowned Pippin king of the Franks, claimed to bestow the Roman empire, and crowned his greater son emperor of the Romans (800).

Effects of the Carolingian Conquest.—To Italy the overthrow of the Lombard kings was the loss of its last chance of independence and unity. To the Lombards the conquest was the destruction of their legal and social supremacy. Henceforth they were equally with the Italians the subjects of the Frank kings. The Carolingian kings expressly recognized the Roman law, and allowed all who would be counted Romans to "profess" it. But Latin influences were not strong enough to extinguish the Lombard name and destroy altogether the recollections and habits of the Lombard rule; Lombard law was still recognized, and survived in the schools of Pavia. Lombardy remained the name of the finest province of Italy, and for a time was the name for Italy itself; but what was specially Lombard could not stand in the long run against the Italian atmosphere which surrounded it. Generation after generation passed more and more into real Italians. Antipathies, indeed, survived, and men even in the 10th century called each other Roman or Langobard as terms of reproach. But the altered name of Lombard also denoted henceforth some of the proudest of Italians; and, though the Lombard speech had utterly perished, their most common names still kept up the remembrance that their fathers had come from beyond the Alps.

But the establishment of the Frank kingdom, and still more the re-establishment of the Christian empire as the source of law and jurisdiction in Christendom, had momentous influence on the history of the Italianized Lombards. The Empire was the counterweight to the local tyrannies into which the local authorities established by the Empire itself, the feudal powers, judicial and military, necessary for the purposes of government, invariably tended to degenerate. When they became intolerable, from the Empire were sought the exemptions, privileges, immunities from that local authority, which, anomalous and anarchical as they were in theory, yet in fact were the foundations of all the liberties of the middle ages in the Swiss cantons, in the free towns of Germany and the Low Countries, in the Lombard cities of Italy. Italy was and ever has been a land of cities; and, ever since the downfall of Rome and the decay of the municipal system, the bishops of the cities had really been at the head of the peaceful and industrial part of their population,
and were a natural refuge for the oppressed, and sometimes for the mutinous and the evil doers, from the military and civil powers of the duke or count, and judge, too often a rule of cruelty or fraud. Under the Carolingian empire, a vast system grew up in the North Italian cities of episcopal "immunities," by which a city with its surrounding district was removed, more or less completely, from the jurisdiction of the ordinary authority, military or civil, and placed under that of the bishop. These "immunities" led to the temporal sovereignty of the bishop; under it the spirit of liberty grew more readily than under the military chief. Municipal organization, never quite forgotten, naturally revived under new forms, and with its "consuls" at the head of the citizens, with its "arts" and "crafts" and "gilds," grew up secure under the shadow of the church. In due time the city populations, free from the feudal yoke, and safe within the walls which in many instances the bishops had built for them, became impatient also of the bishop's government. The cities which the bishops had made thus independent of the dukes and counts next sought to be free from the bishops; in due time they too gained their charters of privilege and liberty.

Left to take care of themselves, islands in a sea of turbulence, they grew in the sense of self-reliance and independence; they grew also to be aggressive, quarrelsome and ambitious. Thus, by the 11th century, the Lombard cities had become "communes," commonwealths, republics, managing their own affairs, and ready for attack or defence. Milan had recovered its greatness, ecclesiastically as well as politically; it scarcely bowed to Rome, and as it aspired to the position of a sovereign city, mistress over its neighbours. At length, in the 12th century, the inevitable conflict came between the republicanism of the Lombard cities and the German feudalism which still claimed their allegiance in the name of the Empire. Leagues and counter-leagues were forged to a federated or loose confederacy, with Milan at its head, challenged the strength of Germany under one of its sternest emperors, Frederick Barbarossa. At first Frederick was victorious; Milan, except its churches, was utterly destroyed; everything that marked municipal independence was abolished in the "rebel" cities; and they had to receive an imperial magistrate instead of their own (1158-1162). But the Lombard league was again formed. Milan was rebuilt, with the help even of its jealous rivals, and at Legnano (1176) Frederick was utterly defeated. The Lombard cities had regained their independence; and at the peace of Constance (1183) Frederick found himself compelled to confirm it.

From the peace of Constance the history of the Lombards is merely part of the history of Italy. Their cities went through the ordinary fortunes of most Italian cities. They quarrelled and fought with one another. They took opposite sides in the great strife of the time between pope and emperor, and were Guelph and Ghibelline by old tradition, or as one or other faction prevailed in them. They swayed backwards and forwards between the power of the people and the power of the few; but democracy and oligarchy passed sooner or later into the hands of a master who held his lordship under various titles, and generally at last into the hands of a family. Then, in the larger political struggles and changes of Europe, they were incorporated into a kingdom, or principality or duchy, carved out to suit the interest of a foreigner, or to make a heaven for the filth and thePage 933Page 934Page 935Page 936Page 937Page 938Page 939Page 940Page 941Page 942Page 943Page 944Page 945Page 946Page 947Page 948Page 949Page 950Page 951Page 952Page 953Page 954Page 955Page 956Page 957Page 958Page 959Page 960Page 961Page 962Page 963Page 964Page 965Page 966Page 967Page 968Page 969Page 970Page 971Page 972Page 973Page 974Page 975Page 976Page 977Page 978Page 979Page 980Page 981Page 982Page 983Page 984Page 985Page 986Page 987Page 988Page 989Page 990Page 991Page 992Page 993Page 994Page 995Page 996Page 997Page 998Page 999 Page 1000

Earthly Thames, a river, a mist. The chief city, the greatest railway centre of Italy; it is in direct communication not only with the other principal towns of Lombardy and the rest of Italy but also with the larger towns of France, Germany and Switzerland, being the nearest great town to the tunnels of the St Gothard and the Simplon. The other railway centres of the territory are Mortara, Pavia and Mantua, while every considerable town is situated on or within easy reach of the railway, this being rendered comparatively easy owing to the relative flatness of the greater part of the country. The line from Milan to Porto Ceresio is worked in the main by electric motor trains, while on that from Lecco to Colico and Chiavenna over-head wires are adopted. The more remote districts and the immediate environs of the larger town are served by steam trams and electric railways. The most important rivers are the Po, which follows, for the most part, the southern boundary of Lombardy, and the Ticino, one of the largest tributaries of the Po, which forms for a considerable distance the western boundary. The majority of the Italian lakes, those of Garda, Idro, Isco, Como, Lago, Varese and Maggiore, lie wholly or in part within it. The climate of Lombardy is thoroughly continental; in summer it is very hot, and in winter very cold, but there are no extremes of heat or cold. In the summer rain is rare beyond the lower Alps, but a system of irrigation, unsurpassed in Europe, and dating from the middle ages, prevails, so that a failure of the crops is hardly possible. There are three zones of cultivation: in the mountains, pasturage; the lower slopes are devoted to the culture of the vine, fruit-trees (including chestnuts) and the silk-worm; while in the regions of the plain, large crops of maize, rice, wheat, flax, hemp and wine are grown, and thousands of mulberry-trees are grown for the benefit of the silk-worms, the culture of which in the province of Milan has entirely superseded the sheep-breeding for which it was famous during the middle ages. Milan is indeed the principal silk market in the world. In 1905 there were 450 mills reeling silk in Lombardy, with 35,407 workers, and 276 throwing mills with 186,000 spindles. The chief centre of silk weaving is Como, but the silk is commercially dealt with at Milan, and there is much exportation. A considerable amount of cotton is manufactured, but most of the raw cotton (600,000 bales) is imported, the cultivation being insignificant in Italy. There are 400 mills in Lombardy, 277 of which are in the province of Milan. The largest linen and woollen mills in Italy are situated at Vara d'Adda. Milan also manufactures motor-cars, though Turin is the principal centre in Italy for this industry. There are copper, zinc and iron mines, and numerous quarries of marble, alabaster and granite. In addition to the above industries the chief manufactures are hats, rope and paper-making, iron-casting, gun-making, printing and lithography. Lombardy is indeed the most industrial district of Italy. In parts the peasants suffer much from pelagra.

The most important towns with their communal population in the respective provinces, according to the census of 1901, are Bergamo (46,861), Treviglio (14,967), total of province 467,549, number of communes 106; Brescia (69,210), Chiari (38,749), total of province 541,795, number of communes 85; Como (38,174), Varese (17,666), Cantù (10,723), Lecco (10,352), total of province 594,316, number of communes 510; Cremona (36,848), Cassalmaggiore (16,407), Soresina (10,358), total of province 397,471, number of communes 133; Mantua (30,177), Viadana (16,082), Quistello (11,228), Suzzara (11,092), St Benedetto Po (10,908), total of province 315,448, number of communes 68; Milan (490,084), Monza (42,124), Lodi (26,872), Busato Arzisio (20,097), Legnano (18,282), Seregno (12,930), Gallarate (11,952), Codogno (11,025), total of province 1,450,214, number of communes 979; Pavia (33,922), Vigevano (23,506), Voghera (20,442), total of province 504,382, number of communes 211; Sondrio (7077), total of province 130,966, number of communes 78. The total population of Lombardy was 4,334,099. In most of the provinces of Lombardy there are far more villagers than in other parts of Italy except Piedmont; this is attributable partly to their mountainous character, partly perhaps to security from attack by sea (contrast the state of things in Apulia).

Previous to the fall of the Roman republic Lombardy formed a part of Gallia Transpadana, and it was Lombardy, Venetia and Piedmont, the portion of the Italian peninsula N. of the Po,
that did not receive citizenship in 89 B.C. but only Latin rights. The gift of full citizenship in 49 B.C. made it a part of Italy proper, and Lombardy and Piedmont formed the 13th region of Augustus (Transpadana) while Venetia and Istria formed the 10th. It was the second of the regions of Italy in size, but the last in number of towns; it appears, however, to have been prosperous and peaceful, and cultivation flourished in its fertile portions. By the end of the 4th century A.D. the name Liguria had been extended over it, and Milan was regarded as the capital of both. Stranger still, in the 6th century the old Liguria was separated from it, and under the name of *Alpes Cottiae* formed the 5th Lombard province of Italy.

For details of subsequent history see LOMBARDY AND ITALY; and for architecture see Architecture. G. T. Rivoira in *Origini dell'Architettura Lombarda* (2 vols, Rome, 1901-1907), successfully demonstrated that the classical origin of much that had hitherto been treated by some authorities as "Byzantine." In the development of Renaissance architecture and art Lombardy played a great part, inasmuch as both Bramante and Leonardo da Vinci resided in Milan at the end of the 15th century.

**Lombok** (called by the natives *Sasak*), one of the Lesser Sunda Islands, in the Dutch East Indies, E. of Java, between 8° 17' and 8° 5' S. and 115° 46' and 176° 40' E., with an area of 3,136 sq. m. It is separated from Bali by the Strait of Lombok and from Sumbawa by the Strait of Alas. Rising out of the sea with bold and often precipitous coasts, Lombok is traversed by two mountain chains. The northern chain is volcanic formation, and contains the peak of Lombok (3,820 ft.), one of the highest volcanoes in the Malay Archipelago. It is surrounded by a plateau (with lower summits, and a magnificent lake, Segara Anak) 8,200 ft. high. The southern chain rises a little over 3,000 ft. Between the two chains is a broad valley or terrace with a range of low volcanic hills. Forest-clad mountains and stretches of thorny jungle alternating with rich alluvial plains, cultivated like gardens under an ancient and elaborate system of irrigation, make the scenery of Lombok exceedingly attractive. The small rivers serve only for irrigation and the growing of rice, which is of superior quality. In the plains are also grown coffee, indigo, maize and sugar, katyay (native beans), cotton and tobacco. All these products are exported. To the naturalist Lombok is of particular interest as the frontier island of the Australian region, with its cockatoos and megapods or mound-builders, its peculiar bee-eaters and ground thrushes. The Sasaks must be considered the aborigines, as no trace of an earlier race is found. They are Mahommedans and distinct in many other respects from the Hindu Balinese, who vanished but not conformed to them. The island was formerly divided into the four states of Karam, Asan, Lombok and the W. side, Mataram in the N.W., Pagurawan in the S.W. and Pagutan in the E. Balinese supremacy dates from the conquest by Agong Dahuran in the beginning of the 19th century; the union under a single raja tributary to Bali dated from 1830. In July 1864 a Dutch expedition landed at Ampanam, and advanced towards Mataram, the capital of the Balinese sultan, who had defied Dutch authority and refused to send the usual delegation to Batavia. The objects of that expedition were to punish Mataram and to redress the grievances of the Sasaks whom the Balinese held in cruel subjection. The first Dutch expedition met with reverses, and ultimately the invaders were forced back upon Ampanam. The Dutch at once despatched a much stronger expedition, which landed at Ampanam in September. Mataram was bombarded by the fleet, and the troops stormed the sultan's stronghold, and Tjakra Negara, another chieftain's citadel, both after a desperate resistance. The old sultan of Mataram was captured, and he and other Balinese chiefs were exiled to different parts of the Malay Archipelago, whilst the sultan's heir fell at the hands of his warriors. Thus ended the Balinese domination of Lombok, and the island passed under Dutch-Indian control, an assistant resident being appointed at Ampanam. Lombok is now administered from Bali by the Dutch resident on that island. The people, however, are in undisturbed exercise of their own laws, religions, customs and institutions. Disturbances between the Sasaks and the Balinese frequently occur. Lombok has been divided since 1898 into the West, Middle and East Lombok. Its chief towns are Mataram, Pemuteran and Kuta. On the eastern coast and harbour of Lombok is the most frequented, though, on account of heavy breakers, it is often difficult of approach. The Sasaks are estimated at 320,000, the Balinese at 50,000, Europeans number about 40, Chinese 500, and Arabs 170.

See A. R. Wallace, *Malay Archipelago* (London, 1869, and later editions). The famous "Wallace's Line" runs immediately west of Lombok, which therefore has an important part in the work, *The Malay Archipelago, With the Malay Archipelago* (Amsterdam and London, 1897), in Dutch and English, is a narrative of the events sketched above, and contains many particulars about the folklore and dual religions of Lombok, which, with Bali, forms the last stronghold of Hinduism east of Java.

**Lombroso, Cesare** (1856-1909), Italian criminologist, was born on the 15th of November 1856 at Verona, of a Jewish family. He studied at Padua, Vienna and Paris, and was one of the pioneers of the scientific study of crime, the study of the criminal, especially the criminals of the Italian towns, was the beginning of criminology as its own branch of science. He was the first to form a method of classifying criminals, and to study their origins and heredity. He began his work with the criminals in the prison of Turin, and he then followed a career of criminology, the study of criminals, and criminology, the study of the causes of crime, and the prevention of crime. He worked in a prison, and he studied the criminals, and he wrote the first book on the subject. The book was called "La Peligrosa Inquinante," and it was the first book on the subject.

Lombroso, like Giovanni Bovio (b. 1841), Enrico Ferri (b. 1856) and Colajanni, well-known Italian criminologists, and his sons-in-law G. Ferrero and Carrara, was strongly influenced by Auguste Comte, and owned to him an exaggerated tendency to refer all mental facts to biological causes. In spite of this, however, and a serious want of accuracy and discrimination in handling evidence, his work made an epoch in criminology; for he surpassed all his predecessors by the wide scope and systematic character of his researches, and he showed that the practical conclusions he drew from them were correct. The spirit of the modern theory is that the criminal population exhibits a higher percentage of physical, nervous and mental anomalies than non-criminals; and that these anomalies are due partly to degeneration, partly to atavism. The criminal is a special type of the human race, standing midway between the lunatic and the savage. This doctrine of a "criminal type" has been gravely criticized, but it is admitted by all to contain a substratum of truth. The practical reform to which it points is a classification of offenders, so that the born criminal may receive a different kind of punishment from the offender who is tempted into crime by circumstances (see also CRIMINOLOGY). Lombroso's biological principles are much less successful in his work on *Genius*, which he explains as a morbid, degenerative condition, presenting analogies to insanity, and not altogether alien to crime. In 1899 he published a work which gives a resume of much of his earlier work, entitled *Le Crime, causes et remèdes*. Later works are: *Delitti vecchi e delitti nuovi* (Turin, 1902); *Nuovi studi sul genio* (2 vols., Palermo, 1902); and in 1908 a work on spiritualism (Eng. trans., *A Study of Madness*; London, 1909), to which subject he had turned his attention during the last years of his life. He died suddenly from a heart complaint at Turin on the 19th of October 1909.

*See Kurella, Cesare Lombroso und die Naturgeschichte des Verbrechers* (Hamburg, 1892); and a biography, with an analysis of his works, and a short account of their general conclusions by his daughters, Paola Carrara and Gina Ferrero, written in 1906 on the occasion of the sixth congress of criminal anthropology at Turin.

**Loménie de Brienne, Étienne Charles de** (1727-1794), French politician and ecclesiastic, was born at Paris on the 6th of October 1727. He belonged to a Limousin family, and after the 18th century, and after a brilliant career as a student entered the Church, as being the best way to attain to a distinguished position. In 1751 he became a doctor of theology, though there were doubts as to the orthodoxy of his thesis. In 1752 he was appointed grand vicar to the archbishop of Rouen. After visiting Rome, he was made bishop of Condum...
LOMOND, LOCH—LOMZA

(1760), and in 1763 was translated to the archbishopric of Toulouse. He had many famous friends, among them A. R. J. Turgot, the Abbé A. Morellet and Voltaire, and in 1770 became an academician. He was on three occasions the head of the bureau de jurisdiction at the general assembly of the clergy; he also took an interest in political and social questions of the day, and addressed to Turgot a number of mémoires on these subjects, one of them, treating of pauperism, being especially remarkable. In 1787 he was nominated as president of the Assembly of Notables, in which capacity he attacked the fiscal policy of Calonne, whom he succeeded as head of the conseil des finances on the 1st of May 1787. Once in power, he succeeded in making the parlement register edicts dealing with internal free trade, the establishment of provincial assemblies and the redemption of the corsée; on their refusal to register edicts on the stamp duty and the proposed new general land-tax, he persuaded the king to hold a décret de justice, to enforce their registration. To crush the opposition to these measures, he persuaded the king to exile the parlement to Troyes (August 15th, 1787). On the agreement of the parlement to sanction a prolongation for two years to the tax of the two vinigènes (a direct tax on all kinds of income), in lieu of the above two taxes, he recalled the councillors to Paris. But a further attempt to force the parlement to register an edict for raising a loan of 120 million livres met with determined opposition. The struggle of the parlement against the incapacity of Brienne ended on the 8th of May in its consenting to an edict for its own abolition; but with the proviso that the states-general should be summoned to remedy the disorders of the state. Brienne, who had in the meantime been made archbishop of Sens, now found himself face to face with almost universal opposition; he was forced to suspend the Cour plénière which had been set up to take the place of the parlement, and himself to promise that the states-general should be summoned. But even these concessions were not able to keep him in power, and on the 29th of August he had to retire, leaving the treasury empty. On the 15th of December following, he was made a cardinal, and went to Italy, where he spent two years. After the outbreak of the Revolution he returned to France, and took the oath of the Civil Constitution of the Clergy in 1790 (see French Revolution). He was repudiated by the pope, and in 1791 had to give up the biretta at the command of Pius VI. Both his past and present conduct made him an object of suspicion to the revolutionaries; he was arrested at Sens on the 9th of November 1793, and died in prison, either of an apoplectic stroke or by poison, on the 16th of February 1794.

The island of Inchlair ("Inch-claire") was the site of a Benedictine priory, dedicated to St. Columba, by which name it was also known. After the Dissolution of the Monasteries, the priory was granted to Lord Dunalpe, who was descended from the family of the last prior. In 1568 the priory was granted to the parishioners of Inchclair, and the priory church was used as a parish church. The priory was surrendered in 1572, and the priory lands were granted to the Earl of Darnley, who had been confirmed in the position by Pope Pius V. The priory was sold in 1577, and the priory lands were granted to the Earl of Darnley. The priory church was used as a parish church until the 17th century, when it was demolished.
poultry, especially geese, are reared. Stock raising is carried on to some extent. The wood trade is important; other industries are the production of pottery, beer, flour, leather, bricks, wooden wares, spirits, tobacco and sugar. There is only one railway (between Grodno and Warsaw); the Bug is navigable, but wool only is floated down the Narew. The territory is divided into seven districts, of which the chief towns, with their populations in 1897, are Lomza (q.v.), Ostołenka (8679), Mazowicz (3000), Ostrów (11,264), Maków (7232), Kolno (4941) and Szczuczyn (5725).

**Lomza**, a town of Russia, capital of the government of the same name, on the Narew, 103 m. by rail N.E. from Warsaw. Pop. (1872), 13,860, (1900) 22,428. Lomza is an old town, one of its churches having been erected before 1000. In the 16th century it carried on a brisk trade with Lithuania and Prussia. It was well fortified and had two citadels, but nevertheless often suffered from the invasions of the Germand and Tatars, and in the 17th century it was the scene of plunder by the Cossacks of the Ukraine. In 1705 it fell under the dominion of Prussia, and after the peace of Tilsit (1807) it came under Russian rule.

**Lonaull**, a town of India, in the Poona district of Bombay, at the top of the Bhor Ghat pass in the Western Ghats, by which the Great Indian Peninsula railway climbs from Bombay to Poona. Pop. (1901), 6686. It contains the locomotive works of the railway. Lonaull is a place of resort from Bombay during the hot season.

**London**, a city and port of entry of Middlesex county, Ontario, Canada, situated 121 m. N.W. of Toronto, on the river Thames and the Grand Trunk, Canadian Pacific and Michigan Central railways. Pop. (1901), 37,681; but several suburbs, not included in these figures, are in reality part of the city. The local nomenclature is largely a reproduction of that of the great city whose name it has borrowed. Situated in a fertile agricultural district, it is a large distributing centre. Among the industrial pursuits are breweries, petroleum refineries, and factories for the manufacture of agricultural implements and of railway carriages. The educational institutions include the Hellmuth Ladies’ College and the Western University (founded in 1878 under the patronage of the Church of England). London was founded in 1825–1826.

London, the capital of England and of the British Empire, and the greatest city in the world, lying on each side of the river Thames 50 m. above its mouth.1 The‘ City,’ so called both formally and popularly, is a small area (673 acres) on the north bank of the river, forming the heart of the metropolis, and constituting within its boundaries one only, and one of the smallest, of twenty-nine municipal divisions which make up the administrative County of London. The twenty-eight remaining divisions are the Metropolitan Boroughs. The county thus defined has an extreme length (E. to W.) of 16 m., an extreme breadth (N. to S.) of 11 1/2 m., and an area of 74,839 acres or about 117 sq. m. The boroughs are as follows:—

1. **North of the Thames.**—Touching the northern boundary of the county, from W. to E.—Hammersmith, Kensington, Paddington, Hampstead, St Pancras, Islington, Stoke Newington, Poplar.

     Bounded by the Thames—Fulham, Chelsea, the City of Westminster (here the City of London intervenes), Stepney, Poplar.

     Between Westminster, the City and Stepney, and the northern boroughs—St Marylebone (commonly Marylebone), Holborn, Finsbury, Shoreditch, Bethnal Green.

2. **South of the Thames.**—Wandsworth, Battersea, Lambeth, Southwark, Camberwell, Bermondsey, Deptford, Lewisham, Greenwich, Woolwich (with a small part of the north bank).

These names are all in common use, though their formal application is in some cases extended over several districts of which the ancient names remain familiar. Each borough is noticed in a separate article.

1 See map in London Statistics (vol. xix., 1909), an annual publication of the London County Council, which besides these divisions shows “Water London,” the London main drainage area, and the Central Criminal Court district.

I. **EXTENT AND SITE**

The County of London is bounded N. and W. by Middlesex, E. by Essex and Kent, S. by Kent and Surrey. The Metropolitan police area, or “Greater London,” however, embraces the whole of Middlesex, with parts of the other three counties and of Hertfordshire. Its extent is 443,419 acres or nearly 693 sq. m., and its population is about seven millions. Only here and there upon its fringe the identity of this great area with the metropolis is lost to the eye, where open country remains unbroken by streets or close-set buildings.

**SITE.**—North of the Thames, and west of its tributary the Lea, which partly bounds the administrative county on the east, London is built upon a series of slight undulations, only rarely sufficient to make the streets noticeably steep. On the northern boundary of the county a height of 443 ft. is found on the open Hampstead Heath. The lesser streams which flow from this high ground to the Thames are no longer open. Some, however, as well as other natural features effaced by the growth of the city, retain an historical interest through the survival of their names as streets and districts, on which their relation to the original site of London (in the present City). South of the Thames a broken amphitheatre of low hills, approaching the river near Greenwich and Woolwich on the east and Putney and Richmond on the west, encloses a tract flatter than that to the north, and rises more abruptly in the southern districts of Streatham, Norwood and Forest Hill.

In attempting to picture the site of London in its original condition, it is necessary to consider (1) the condition of the Thames unconfined between made banks, (2) the slopes overlooking it, (3) the tributary streams which watered these slopes. The low ground between the slight hills flanking the Thames valley, and therefore mainly south of the present river, was originally occupied by a shallow lagoon of estuarine character, tidal, and interspersed with marshy tracts and certain islets of relatively firm land. Through it the stream of the Thames pursued an ill-defined course. The tributary streams entered through marshy channels. The natural process of sedimentation assisted the gradual artificial drainage of the marshes by means of embankments confining the river. The breadth of this low tract, from Chelsea downward, was from 2 to 3 m. The line of the foot of the southern hills, from Putney, where it nearly approaches the present river, lies through Stockwell and Camberwell to Greenwich, where it again approaches the river. On the north there is a flat tract between Chelsea and Westminster, covering Pimlico, but from Westminster down to the Tower there is a marked slope directly up from the river bank. Still lower, marshes formerly extended far up the valley of the Lea. The higher slopes of the hills were densely forested (cf. the modern district-name St John’s Wood), while the lower slopes, north of the river, were more open (cf. Moat-gate). The original city grew up on the site of the City of London of the present day, on a slight eminence intersected by the Wal- or Wall-bank, and flanked on the west by the river Fleet.

These and other tributary streams have been covered in and built over (in some cases serving as sewers), but it is possible to trace their valleys at various points by the fall and rise of streets crossing them, and their names survive, as will be seen, in various modern applications. The Wallbrook rose in a marsh in the modern district of Finsbury, and joined the Thames close to the Cannon Street railway bridge. A street named after it runs south from the Mansion House parallel with its course. The Fleet was larger, rising in, and collecting various small streams from, the high ground of Hampstead. It passed Kentish Town, Camden Town and King’s Cross, and followed a line approximating to King’s Cross Road. The slope of Farrington Road, where crossed by Holborn Viaduct, and of Old Bridge Street, Blackfriars, marks its course exactly, and that of Fleet Street and Ludgate Hill its steep banks. The name also appears in Fleet Road, Hampstead. From King’s Cross downward the banks were so steep and high that the stream was called...
Hollow or Hole-bourn, this name surviving in Holborn; and it was fed by numerous springs (Bagnigge Well, Clerkenwell and others) in this vicinity. It entered a creek which was navigable for a considerable distance, and formed a subsidiary harbour for the City, but by the 14th century this was becoming choked with refuse, and though an attempt was made to clear it, and wharves were built in 1670, it was wholly arched over in 1737-1765 below Holborn Bridge. Continuing westward, the most important stream was Tyburn (q.v.), which rose at Hampstead, and joined the Thames through branches on either side of Thorney Island, on which grew up the great ecclesiastical foundation of St Peter, Westminster, better known as Westminster Abbey. There is no modern survival of the name of Tyburn, which finds, indeed, its chief historical interest as attaching to the famous place of execution which lay near the modern Marble Arch. The residential district in this vicinity was known at a later date as Tyburnia. The next stream westward was the Westbourne, the name of which is perpetuated in Westbourne Grove and elsewhere in Paddington. It rose on the heights of Hampstead, traversed Paddington, may be traced in the course of the Serpentine lake in Hyde Park, ran parallel to and east of Sloane Street, and joined the Thames close to Chelsea Bridge. The main tributaries of the Thames from the north, east and west of those described, are not covered, nor is any tributary of importance from the south entirely concealed.

Geology.—London lies within the geological area known as the London basin. Within the confines of Greater London the chalk which forms the basement of this area appears at the surface in isolated patches at Epping, Greenwich, while its main line approaches the city within 10 m. of the centre and within 1.5 to the north-west. In the south and north-west the typical London clay is the principal formation. In the south-east, however, the Blackheath and Woolwich pebble-beds appear, with their belts of Thanet sands bordering the chalk. Valley gravel, borders the Thames, with some interlacing sections from Kingston to Greenwich, and extends to a wide belt, with ramifications, from Wandsworth south to Croydon, and in a narrower line from Greenwich towards Bromley. Brick earth outcrops near Epping to Barking. Kensington to Brentford and west thereof, and appears in Chelsea and Fulham, Hornsey and Stoke Newington, and in patches south of the Thames between Battersea and Richmond. The main deposits of alluvium occur between Lambeth and West London, and the valley of the Wandle, which joins the Thames from the south near Putney. In the north and west the clay is interspersed with patches of plateau gravel in the direction of Finchley (where boulder clay also appears), Enfield and Barnet. Highgate, and the Weald Heath and Harrow Hill. Gravel is found on the high ground around Richmond Park and Wimbledon. (See further Middlesex.)

Climate.—The climate is equable (though excessive heat is sometimes experienced), and moist but healthy. Snow is most common in the early months of the year. The fogs of London have a peculiar and perhaps an exaggerated notoriety. They are apt to occur at all seasons, are common from September to December, and most common in November. The atmosphere of London is almost invariably misty in a greater or less degree, but the drench fogs are generally local and of no long duration. They sometimes cause a serious dislocation of railway and other traffic. Their principal cause is the smoke from the general domestic use of coal. The evil is of very long standing, for in 1536 the citizens petitioned Edward I, to prohibit the use of sea-coal, and he made it a capital offence. The average temperature of the hottest month, July, is 74°F.; of the coldest, January, 37°F.; and the mean annual 52°F. The mean annual rainfall ranges in different parts of the metropolis from about 20 to 271 in.

II. Topography

London as a whole owes nothing in appearance to the natural configuration of its site. Moreover, the splendid building is nearly always a unit; seldom, unless accidentally, a component part of a broad effect. London has not grown up along formal lines; nor is any large part of it built according to any conceptual plan. Yet not a part of the great thoroughfares and buildings are individually worthy of London's pre-eminence as a city. The most notable of these fall within a circumscribed area, and it is therefore necessary to prefaze their consideration with a statement of the broader characteristic divisions of the metropolis.

Characteristic Divisions.—In London north of the Thames, the salient distinction lies between West and East. From the western boundary of the City proper, an area covering the greater part of the city of Westminster, and extending into Chelsea, Kensington, Paddington and Marylebone, is exclusively associated with the higher-class life of London. Within the bounds of Westminster are the royal palaces, the government offices and many of the finest public buildings, and the wider area specified includes the majority of the residences of the wealthier classes, the most beautiful parks and the most fashionable places of recreation. "Mayfair," north of Piccadilly, and "Belgravia," south of Knightsbridge, are common though unofficial names for the richest residential districts. The "City" bears in the great commercial buildings fringing its narrow streets all the marks of a centre of the world's exchanges. East of it there is an abrupt transition to the district commonly known as the "East End," as distinguished from the wealthy "West End," a district of mean streets, roughly coincident with the boroughs of Stepney and Poplar, Shoreditch and Bethnal Green, and primarily (though by no means exclusively) associated with the problems attaching to the life of the poor. On the Thames below London Bridge, London appears in the aspect of one of the world's great ports, with extensive docks and crowded shipping. North London is as a whole residential: Hackney, Islington and St Pancras consist mainly of dwellings of artisans and the middle classes; while in Hampstead, St Marylebone and Paddington are many terraces and squares of handsome houses. Throughout the better residential quarters of London the number of large blocks of flats has greatly increased in modern times. But even in the midst of the richest quarters, in Westminster and elsewhere, small but well-defined areas of the poorest dwellings occur.

London south of the Thames has none of the grander characteristics of the wealthy districts to the north. Poor quarters lie adjacent to the river over the whole distance from Battersea to Greenwich, merging southward into residential districts of better class. London has no single well-defined manufacturing quarter.

Suburbs.—Although the boundary of the county of London does not entirely coincide with that of the metropolis, the suburban districts of London outside that boundary may be conveniently considered as suburban. Large numbers of business men and others who must of necessity live in proximity to the metropolis have their homes aloof from its centre. It is estimated that upwards of a million daily enter and leave the City alone as the commercial heart of London, and a great proportion of these travel in and out by the suburban railways. In this aspect the principal extension of London has been the course from London Bridge and Waterloo to Croydon, the North London line, the Stockwell and Battersea branches of the West London railway, the Sevenoaks and the Southend line to the east of the Thames, and the railways from the Surrey and the Middlesex shores of the river. On the west and north the suburban districts immediately outside the county include Acton and Ealing, Willesden, Highgate, Finchley and Hoeney; from the last two a densely populated district extends north through Wood Green and Southgate to Barnet and Enfield; while the "residential influence" of the metropolis far exceeds these limits, and may be observed at Harrow and Pinner, Bushey and Boxmoor, St Albans, Harpenden, Stevenage and many other places. To the north-east the beauty of Epping Forest attracts numerous residents to Woodford, Chingford and Loughton. The valley of the Lea is also thickly populated, but chiefly by an industrial population working in the adjacent factory towns. London Bridge is the greatest of this river. The county of London from Essex, but the townships of West Ham and Stratford, Barking and Ilford, Leyton and Walthamstow continue the metropolis in this direction almost without a break. Their population is largely engaged in the manufacturing establishments; while numerous towns on either bank of the lower Thames share in the industries of the port of London.

Streets.—The principal continuous thoroughfares within the metropolis, though each bears a succession of names, are coincident with the main roads converging upon the capital from all parts of England. On the north of the Thames two great thoroughfares from the west meet in the heart of the City. The northern enters the county in Hammersmith as Uxbridge Road, crosses Kensington and borders the north side of Kensington Gardens and Hyde Park as Bayswater Road. It then bears successively the names of Oxford Street, New Oxford Street and High Holborn; enters the City, becomes known as Holborn Viaduct from the fact that it is there carried over other
LONDON

streets which lie at a lower level, and then as Newgate Street and Cheapside. The southern highway enters Hammersmith, crosses the centre of Kensington as Kensington Road and High Street, borders Kensington Gardens and Hyde Park as Kensington Gore and Knightsbridge, with terraces of fine residences, and merges into Piccadilly. This beautiful street, with its northward branches, Park Lane, from which splendid houses overlook Hyde Park, and Bond Street, lined with handsome shops, may be said to focus the fashionable life of London. The direct line of the thoroughfare is interrupted after Piccadilly Circus (the term “circus” is frequently applied to the open space—not necessarily round—at the junction of several roads), but is practically resumed in the Strand, with its hotels, shops and numerous theatres, and continued through the City in Fleet Street, the centre of the newspaper world, and Ludgate Hill, at the head of which is St Paul’s Cathedral. Thence it runs by commercial Cannon Street to the junction with Cheapside and several other busy streets. At this junction stand the Royal Exchange, the Mansion House (the official residence of the Lord Mayor of London) and the Bank of England, from which this important point in the communications of London is commonly known as “Bank.” From the east two main roads, similarly converge upon the City, which they enter by Aldgate (the suffix in this and other names indicating the former existence of one of the City gates). The southern of these highways, approaching through the eastern suburbs as Barking Road, becomes East India Docks Road in Poplar and Commercial Road East in Stepney. The continuous thoroughfare of 12 m. between Hammersmith and the East India Docks illustrates successively every phase of London life. The northern road enters from Stratford and is called Bow Road, Mile End Road, Whitechapel Road and High Street, Whitechapel. From the north of England two roads preserve communication-lines from the earliest times. The Old North Road, entering London from the Lea valley through Hackney and Shoreditch as Stamford Hill, Stoke Newington Road and Kingsland Road, reaches the City by Bishopsgate. The straight highway from the north-west which as Edgeware Road joins Oxford Street at the Marble Arch (the north-eastern entrance to Hyde Park) is coincident with the Roman Watling Street. The Holyhead and Great North Roads, uniting at Barnet, enter London by branches through Hampstead and through Highgate, between the Old North and Edgeware roads. South of the Thames the thoroughfares crossing the river between Lambeth and Bermondsey converge upon two circuses, St George’s and the Elephant and Castle. At the second of these points the majority of the chief roads from the southern suburbs and the south of England are collected. Among them, the Old Kent Road continues the southern section of Watling Street, from Dover and the south-east, through Woolwich and across Blackheath. The road through Streatham, Brixton and Kennington, taking name from these districts successively, is the principal southern highway. The Portsmouth Road from the south-west is well marked as far as Lambeth, under the names of Wandsworth, High Street, St John’s Hill, Lavender Hill and Wandsworth Road.

Thames Embankments.—The Thames follows a devious course through London, and the fine embankments on its north side, nowhere continuing uninterruptedly for more than 2 m., do not form important thoroughfares, with the exception of the Victoria Embankment. Mostly they serve rather as beautiful promenades. One of them begins over against Battersea Bridge. Its finest portion is the Chelsea Embankment, fronting Battersea Park across the river, shaded by a pleasant avenue and lined with handsome houses. It continues, with some interruptions, nearly as far as the Houses of Parliament. Below these the grandest of the embankments extends to the City at Blackfriars. It was formed in 1864–1870, and is named the Victoria Embankment, though its popular title is “The Embankment” simply. Open gardens fringe it in part on the landward side, and it is lined with fine public and private buildings. The bold sweep of the Thames, here some 300 yds. wide, the towers of Westminster on the one hand and the dome of St Paul’s on the other, make up a fine prospect. Below London Bridge the river is embanked for a short distance in front of the Tower of London, and above Westminster Bridge the Albert Embankment extends for nearly 1 m. along the south bank.

Bridges.—Fourteen road-bridges cross the Thames within the county of London. Of these London Bridge, connecting the City with Southwark and Bermondsey, stands first in historical interest and in importance as a modern highway. The old bridge, famous for many generations, bearing its rows of houses and its chapel in the centre, was completed early in the 13th century. It was 308 yds. long and had twenty narrow arches, through which the tides formed dangerous rapids. It stood just below the existing bridge, which was built of granite by John Rennie and his son Sir John Rennie, and completed in 1831. A widening to accommodate the growth of traffic, after being frequently discussed for many years, was completed in 1904, by means of corbels projecting on either side, without arresting traffic during the work. There was no bridge over the Thames below London Bridge until 1894, when the Tower Bridge was opened. This is a suspension bridge with a central portion, between two lofty and massive stone towers, consisting of bascules which can be raised by hydraulic machinery to admit the passage of vessels. The bridge is both a remarkable engineering work, and architecturally one of the finest modern structures in London. The bridges in order above London Bridge are as follows, railway-bridges being bracketed—Southwark, (Cannon Street), (Blackfriars), Blackfriars, Waterloo, (Hungerford—with a footway), Westminster, Lambeth, Vauxhall, (Grosvenor), Victoria, Albert, Battersea, (Battersea), Wandsworth, (Putney), Putney and Hammersmith. Waterloo Bridge, the oldest now standing within London, is the work of John Rennie, and was opened in 1817. It is a massive stone structure of nine arches, carrying a level roadway, and is considered one of the finest bridges of its kind in the world. The present Westminster Bridge, of iron on granite piers, was opened in 1862, but another preceded it, dating from 1750; the view from which was appreciated by Wordsworth in his sonnet beginning “Earth has not anything to show more fair.” The complete reconstruction of Vauxhall Bridge was undertaken in 1902, and the new bridge was opened in 1906. Some of the bridges were built by companies, and tolls were levied at their crossing until modern times; thus Southwark Bridge was made toll-free in 1866, and Waterloo Bridge only in 1878, on being acquired by the City Corporation and the Metropolitan Board of Works respectively. The road-bridges mentioned (except the City bridges) are maintained by the London County Council, who expended for this purpose a sum of £1049 in 1907–1908. The following table shows the capital expenditure on the more important bridges and their cost of maintenance in 1907–1908:

The properties entrusted to the Corporation for the upkeep of London Bridge are managed by the Bridge House Estates Committee, the revenues from which are also used in the maintenance of the other three City bridges. £26,989 being thus expended in 1907, the Tower bridge absorbing £17,735 of this amount.

Thames Tunnels.—Some of the metropolitan railway lines cross the river in tunnels beneath its bed. There are also several tunnels under the river below London Bridge, namely: Tower Subway, constructed in 1870 for foot-passengers, but no longer used, Greenwich Tunnel (1902) for foot-passengers, Blackwall Tunnel (1867), constructed by the County Council between Greenwich and Poplar, and Woolwich Tunnel, begun...
LONDON

in 1910. A tunnel between Rotherhithe and Ratcliff was authorized in 1897 and opened in 1908. The Thames Tunnel (1825–1843), 2 miles below London Bridge, became a railway tunnel in 1865. The County Council maintains a free ferry at Woolwich for passengers and vehicular traffic. The capital expenditure on this undertaking was £85,337 and the expense of maintenance in 1907–1908 £20,881. The Greenwich Tunnel (capital expenditure £170,293) in the same year had expended on it for maintenance £3,725, and the Blackwall Tunnel (capital expenditure £1,268,951) £11,420. The capital expenditure on the Rotherhithe Tunnel was £1,414,561.

Parks.—The administration and acreage of parks and open spaces, and their provisions for the public recreation, fall for consideration later, but some of them are notable features in the topography of London. The royal parks, namely St James’s, Green and Hyde Park, and Kensington Gardens, stretch in an irregular belt for nearly 3 miles between Whitehall (Westminster) and Kensington. St James’s Park was transformed from marshy land into a deer park, bowling green and tennis court by Henry VIII., extended and laid out as a pleasure garden by Charles II., and restored to its original form by the designs of Capability Brown in 1761.

Its lake, the broad Mall leading up to Buckingham Palace, and the proximity of the government buildings in Whitehall, combine to beautify it. Here was established, by licence from James I., the so-called Milk Fair, which remained, its ownership always in the same family, until 1905, when, on alterations being made to the Mall, a new stall was erected for the owners during their lifetime, though the cow or cows kept here were no longer allowed. St James’s Park is continued between the Mall and Piccadilly by the Green Park. Hyde Park, to the west, belonged originally to the manor of Hyde, which was attached to Westminster Abbey, but was taken by Henry VIII. on the dissolution of the monasteries. Two of its gateways are noteworthy, namely that at Hyde Park Corner at the south-east and the Marble Arch at the north-east.

The first was built in 1828 from designs of Decimus Burton, and comprises three arches with a frieze above the central arch copied from the Elgin marbles in the British Museum. The Marble Arch was intended as a triumphal archway, and first stood in front of Buckingham Palace, being moved to its present site in 1851. It no longer forms an entrance to the park, as in 1908 a corner of the park was cut off and a roadway was formed to give additional accommodation for the heavy traffic between Oxford Street, Edgeware Road and Park Lane. The Marble Arch was thus left isolated. Hyde Park contains the Serpentine, a lake 1,500 yards in length, from the bridge over which one of the finest prospects in London is seen, extending to the distant towers of Westminster. Since the 17th century this park has been one of the most favoured resorts of fashionable society, and at the height of the “season,” from May to the end of July, its drives present a brilliant scene. In the 17th and 18th centuries it was a fashionable dwelling-ground, and in the present day it is not infrequently the scene of political and other popular demonstrations (as is also Trafalgar Square), while the neighbourhood of Marble Arch is the constant resort of orators on social and religious topics. Kensington Gardens and Hyde Park are subsequently much extended; they are magnificently timbered, and contain plantations of rare shrubs and flowering trees. Regent’s Park, mainly in the borough of Marylebone, owes its preservation to the intention of George III. to build a palace here. The other most notable open spaces wholly or partly within the city are the Hampstead Heath in the north-west, a wild, high-lying tract preserved to a great extent in its natural state, and in the south-west Wimbledon Common, Putney Heath and the royal demesne of Richmond Park, which from its higher parts commands a wonderful view up the rich valley of the Thames. The outlying parts of the county to east, south and north are not lacking in open spaces, but there is an extensive inner area where at most only small gardens and squares break the continuity of buildings, and where in some cases old churchyards serve as public grounds.

Architecture.—White stone was the material used in the construction of the majority of great buildings of London, some modern examples (notably the Westminster Roman Catholic cathedral) are of red brick with stone dressings; and brick is in common use for general domestic building. The smoke-laden atmosphere has been found not infrequently to exercise a deleterious effect upon the stonework of important buildings; and through the same cause the appearance of London as a whole is by some condemned as sombre. Bright colour, in truth, is wanting, though attempts are made in a few important modern edifices to supply it, a notable instance being the Savoy Hotel (1906). Expenditure has been more commonly employed in the larger buildings, as in St Paul’s Cathedral, and under the various influences of weather and atmosphere acquires strongly contrasting tones of light grey and black. Owing to the by-laws of the County Council, the method of raising commercial buildings to an extreme height is not practised in London; the block known as Queen Anne’s Mansions, Westminster, is an exception, though it cannot be called high in comparison with American high buildings.

Architectural remains of earlier date than the Norman period are very few, and of historical rather than topographical importance. In architecture of the Norman and Gothic periods London must be considered rich, though its richness is poverty of important buildings; and through the same cause the appearance of London as a whole is by some condemned as sombre. Bright colour, in truth, is wanting, though attempts are made in a few important modern edifices to supply it, a notable instance being the Savoy Hotel (1906). Expenditure has been more commonly employed in the larger buildings, as in St Paul’s Cathedral, and under the various influences of weather and atmosphere acquires strongly contrasting tones of light grey and black. Owing to the by-laws of the County Council, the method of raising commercial buildings to an extreme height is not practised in London; the block known as Queen Anne’s Mansions, Westminster, is an exception, though it cannot be called high in comparison with American high buildings.
of the nuns and the parishioners respectively. The church of St Mary-le-Bow, in Cheapside, is built upon a Norman crypt, and that of St Olave's, Hart Street, which was Pepys's church and contains a modern memorial to him, is of the 13th century. Other ancient churches outside the City are few; but there may be mentioned Margaret's, under the shadow of Westminster Abbey; and the beautiful Ely Chapel in Holborn (q.v.), the only remnant of a palace of the bishops of Ely, now used by the Roman Catholics. The Chapel was built by Bishop Gower on the site of Savoy Palace, which was erected by Peter, earl of Savoy and Richmond, in 1245, and destroyed in the insurrection of Wat Tyler in 1381. In 1505 Henry VII. endowed here a hospital of St John the Baptist for the poor. The chapel was used as the parish church until 1837, when it was demolished to make room for the church of St Mary-le-Bow, commonly called Bow Church, is one of the most noteworthy. This church has various points of interest besides its Norman crypt, from which it took the name of Bow, being the first church in London built on arches. The ecclesiastical Court of Arches sat here formerly, and there are many fine tombs in the churchyard. The church is built to be used, the necessity for haste and the jealous guardianship of rights to old foundations resulted in the old lines being generally followed. It is characteristic of London that St Paul's Cathedral (q.v.), the one remaining Roman Catholic church of London and Westminster Abbey. Of Wren's other churches it is to be noted that the necessity of economy usually led him to pay special attention to a single feature. He generally chose the steeple, and there are many fine examples of the use of this feature in the churches he built. Some of the old churches of the City, with the exceptions mentioned, are not as a rule remarkable, many are notable for the rich and beautiful wood-carving they contain. A Gothic style has been most commonly adopted, and should be closely hemmed in by means of its and magisterial work of the Roman Catholic Westminster Cathedral (see WESTMINSTER), is Byzantine and was built principally in brick, with a lofty campanile. The only other ecclesiastical building to be specially mentioned is the ancient Westminster School, founded by Queen Elizabeth. Westminster Abbey, has been a seat of the archbishops of Canterbury since 1197, and though the present residential portion dates only from the early 19th century, the chapel, hall and other parts are of the 13th century and later. At all secular buildings, there is none more venerable than the Cathedral of London (q.v.), the moated fortress which overlooks the Thames at the eastern boundary of the City. It presents fine examples of Norman architecture; its historical and regalia of England, which are kept here, attract great numbers of visitors.

The Houses of Parliament, with Westminster Abbey and St Margaret's Church, complete the finest group of buildings which London possesses; a group essentially Gothic, for the Houses of Parliament, completed in 1867 from the designs of Barry, are in a late Perpendicular style. They cover a large area, with a massive south front, the 700 ft. long and 400 ft. wide, pierced by five huge towers. The ancient Westminster Hall, belonging to the former royal palace (see WESTMINSTER), is built principally in brick, with a lofty campanile. The only other ecclesiastical building to be specially mentioned is the ancient Westminster School, founded by Queen Elizabeth. Westminster Abbey, has been a seat of the archbishops of Canterbury since 1197, and though the present residential portion dates only from the early 19th century, the chapel, hall and other parts are of the 13th century and later. Monuments and Memorials.—The Monument (1677), Fish Street Hill, City, erected from the designs of Wren in commemoration of the great fire of 1666, is a Doric column surmounted by a gilt representation of a flaming urn. The Nelson Column, the central feature of Trafalgar Square, an exact copy of the famous Column of Constantine in Piazza Navona at Rome, is crowned with a statue of Nelson by Baily, and has at its base four colossal lions in bronze, modelled by Sir Edwin Landseer. A statue of the duke of Cambridge, by Adam Jones, was unveiled in 1902 on the War Office, Whitehall. The duke of York’s Column, Carlton House Terrace (1833), an Ionic pillar, is surmounted by a bronze statue by Sir Richard Westmacott. The Westminster Column, outside the entrance to Dean’s Yard, was erected to the memory of the old pupils of Westminster School who fell in the Crimean War. The statue of William IV. by Sir Richard Westmacott, near the Palace of Westminster, is a statue of the Prince (1879) by John Henry Foley beneath a huge ornate Gothic canopy. At the eastern end of the Strand a memorial with statue by Hamo Thornycroft of William Ewart Gladstone was unveiled in 1905. In Parliament Square and elsewhere are numerous statues of some of high merit, but it cannot be said that statutory occurs an important place in the adornment of streets and open places in London. Cleopatra’s Needle, an ancient Egyptian monument, was presented to the government by Mehemet Ali in 1819, brought from Alexandria in 1878, and erected on the Victoria embankment on a pedestal of grey granite.

Nomenclature.—Having regard to the destruction of visible evidences of antiquity in London, both through accidental agencies such as the great fire, and through inevitable modernizing influences, it is well that historical associations in nomenclature are preserved in a great measure unimpaired. The City naturally offers the richest field for study in this direction. The derivations of names may here be grouped into two classes, those having a commercial connexion, and those associated with ancient buildings, particularly the City wall and ecclesiastical foundations. Among examples of the first group, Cheapside is prominent. This modern thoroughfare of shops was in early times the chief market or market-place, the area of shops and stalls used by the market, having, until the 14th century, a space set apart for popular entertainments. There was a Queen Eleanor cross here, and conduits supplied the city with water. Modern Cheapside merges eastward into the street called the Poultry, from the poulterers’ stalls “but lately departed from thence,” according to Stow, at the close of the 16th century. Cornhill, again, recalls the cornmarket “time out of mind where holden” (Stow), and Gracechurch Street was corrupted from the name of the church of St Benet Grasschurch (destroyed by the great fire, rebuilt, and removed in 1868), which was said to be derived from a herb-market held under its walls. The Jews had their quarters near the commercial centre, their presence being indicated by the street named Old Jewry, though it is probable that they did not reoccupy this locality after their expulsion in 1290. Lombard Street similarly points to the residence of Lombard merchants, the name existing when Edward II. confirmed a grant to Florence merchants in 1328, while the Lombards maintained their position until Tudor times. Paternoster Row, still occupied by booksellers, takes name from the sellers of prayer-books and writers of books who collected under the shadow of St Paul’s Cathedral. As regards names derived from ancient buildings, instances are the streets called London Wall and Barbican, and those named after the numerous gates. Of those associated with ecclesiastical foundations several occur in the course of this article (Section II., Ecclesiastical Architecture, &c.). Such are Austin Friars, Crutched Friars, Blackfriars and Whitefriars. To this last district a curious alternative name, Alsatia, was given, probably in the 17th century, with reference to its notoriety as a hiding-place of debtors. A derivation is suggested from the disputed territory of Alsace, pointing the contrast between this lawless district and the adjacent Temple, the home of the law itself. The name Bridewell came from a well near the Fleet (New Bridge Street), dedicated to St Bride, and was attached to a house built by Henry VIII. (1522), but is most familiar in its application to the house of correction instituted by Edward VI., which remained a prison till 1865. The Minories, a street leading south from Aldgate, takes name from an abbey of nuns of St Clare (Sorores Minores) founded in 1293. Apart from the City an interesting ecclesiastical survival is the name Broad Sanctuary, Westminster, recalling the place of sanctuary which long survived the monastery under the protection of which it originally existed. Covent Garden, again, took its name from a convent garden belonging to Westminster. Among the survivals of names of non-ecclesiastical buildings Castle Baynard may be noted; it stood in the City on the banks of the Thames, and was held by Ralph Baynard, a Norman, in the time of William the Conqueror; a later building being erected in 1428 by Humphrey duke of Gloucester. Here Richard III. was acclaimed king, and the mansion was used by Henry VII. and Henry VIII. Its name is kept in a wharf and a ward of the City.

The survival of names of obliterated physical features or characteristics is illustrated in Section I.; but additional instances are found in the Strand, which originally ran close to the sloping bank of the Thames, and in Smithfield, now the central market, but for long the “smooth field” where a cattle and hay market was held, and the scene of tournaments and games, and also of executions. Here in 1391 Wat Tyler the rebel was killed by Sir William Walworth during the parliament with Richard II. In the West End of London the majority of important street-names are naturally of a later derivation than those in the ancient City, though Charing Cross (q.v.) is an instance of an exception. The derivation commonly accepted for Piccadilly is from pickadill, a stiff collar or hem in fashion in the early part of the 17th century (Span. pica, a spear-head). In Pall Mall and the neighbouring Mall in St James’ Park is found the title of a game resembling croquet (Fr. poisille maille) in favour at or before the time of Charles I., though the Mall was laid out for the game by Charles II. Other names pointing to the existence of pastimes now extinct are found elsewhere in London, as in Balls Pond Road, Islington, where in the 17th century was a proprietary pond for the sport of duck-hunting. An entertainment of another form is recalled in the name of Spring Gardens, St James’ Park, where at the time of James I. there was a fountain or spring so arranged as to besprinkle those who trod unwarily on the valve which opened it. Many of the names of the rich residential streets and squares in the west have associations with the various owners of the properties; but Mayfair is so called from a fair held on this ground in May as early as the reign of Charles II. Finally there are several survivals, in street-names, of former private mansions and other buildings. Thus the district of the Adelphi, south of Charing Cross, takes name from the block of dwellings and offices erected in 1768 by the brothers (Gr adelphi) Robert and William Adam, Scottish architects. In Piccadilly Clarendon House, erected in 1664 by Edward Hyde, earl of Clarendon, became Albemarle House when acquired by the duke of Albemarle in 1675. Northumberland House, from which is named Northumberland Avenue, opening upon Trafalgar Square, was built c. 1605 by Henry Howard, earl of Northampton, and was acquired by marriage by Algernon Percy, earl of Northumberland, in 1642. It took name from this time, c. 1674 till 1874. Arundel House, originally a seat of the bishops of Bath, was the residence of Thomas Howard, earl of Arundel, whose famous collection of sculpture, the Arundel Marbles, was housed here until presented to Oxford University in 1667. The site of the house is marked by Arundel Street, Strand.

III. Communications

Railways.—The trunk railways leaving London, with their termini, are as follows: (1) Northern. The Great Northern, Midland and London & North-Western systems have adjacent termini, at King’s Cross, St Pancras, Euston, in Euston Road, St Pancras. The terminus of the Great Central railway is Marylebone, in the road of that name. (2) Western. The terminus of the Great Western railway is Paddington (Prad Street); and that of the London & South-Western, Waterloo, south of the Thames in Lambeth. (3) Southern. The London, Brighton & South Coast railway has its western terminus at Victoria, and its central terminus at London Bridge, on the south side of the Thames. The South-Eastern & Chatham railway has four terminal stations, all on or close to the
north bank of the river—Victoria, Charing Cross; Harbourside and Cannon Street (City). St. Paul's Station on the Holborn branch is also terminal in part. (4) Eastern. The principal terminus of the Great Eastern Railway is in Liverpool Street (City), but the company also maintains lines to Shoreditch, Stratford, Walthamstow, Ilford, and Bethnal Green. The Eastern District Railway also has its terminus at Liverpool Street. The East London Railway carries traffic to and from the Borough of Bow, and the Eastern Counties Railway to Woodford. The Metropolitan Railway carries traffic on its own level line to Epping. The West End of London is connected with the eastern counties by the Great Eastern Railway, the Eastern Counties Railway, and the Metropolitan Railway, and with the north by the Great Northern Railway. The southern parts of London are connected with the Thames by the Great Western Railway and the South-Eastern Railway. The railway system of London is complex, and the main lines are interconnected by means of branch lines and tramways. The London Underground Railway, which was established in 1863, consists of a number of lines, and is an important part of the London transport system.

northern and southern tramway services, involved the removal of the Charing Cross terminus of the South Eastern and Chatham railway to the south side of the river, and the construction of a new bridge in place of the railway bridge. The mere control of existing traffic, local street improvements, and provision of new means of com-

communication between the two points, was felt to have the root of the problem, and in 1903 a Royal Commission was appointed to consider the whole question of locomotion and transport in London, expert evidence being taken from engineers, representatives of various railways, the City Council, borough councils and police, and others. The commission reported in 1905.1

With regard to street improvements the most important recommendation was that of the construction of two additional streets (separated by 40 ft. and 22 ft.) from Bayswater Road to Whitechapel, passing through the city in the neighbourhood of London Wall, and another from Holloway to the Elephant and Castle, to cross the Thames by a new bridge. A total of £10,000,000 was put to the present navigation; this would make the river navigable from Barking to Greenwich, and the removal of pleasure boats would clear the river of the present navigation, and provide for increased shipping in the future. The railway companies have made considerable improvements in their services, and the introduction of electric traction has greatly improved the traffic. The commission recommended that electric traction should be introduced on the London and North-Western Railway, and on the London and South-Western Railway, and that the Government should provide funds for the extension of electric trams in the city.

Finally, the commission made the important recommendation that a traffic board should be established for London, to exercise a general supervision of traffic, and to act as a tribunal to which the public could appeal in cases of dispute. The commission recommended that the traffic board should be established on a separate system of exchanges and lines, intercommunication between the two systems being arranged. Charges were reduced and efficiency benefited by this movement. The area covered by the London Traffic Board includes the whole of the city, and extends from Romford, Enfield, Harrow, &c., north of the Thames, to Dartford, and south of it. Public call offices are provided in numerous shops, railway stations and other public places, and at many police posts. The District Messenger Company affords facilities through local offices for the use of special messengers.

IV. Population, Public Health, &c.

The population of Greater London by the census of 1901 was 5,581,452.

The following table gives comparisons between the figures of certain census returns for Greater London and its chief component parts, namely, the City, the county, and the outer ring (i.e. Greater London outside the county). All the figures before the 19th century are adjusted to these areas.

<table>

</table>

The reason for the decrease in the resident City population is to be found in the rapid extension of business premises, while the widening ramifications of the outer residential areas are illustrated by the increase in the later years of the population of the Outer Ring. The growth and population of London to the 19th century is considered under History, ad fin.

The foreign-born population of London was 60,242 in 1881, and 135,777 in 1901. During 1901, 27,070 aliens (excluding sailors) were admitted at the port, and in 1902, 33,070. Of these last Russians and Poles numbered 21,013; Germans, 3,301; Austrians and Hungarians, 2,077; Dutch, 192; Norwegians, 131; and Romanians, 105. Other nationalities numbered below one thousand each. The foreign-born population of London has increased, the number of foreign-born having increased in 1901, being 1,875 in 1881 and 2,989 in 1901.

Residents of Irish birth have decreased since 1851; those of Scottish birth have increased steadily, and roughly as the population. German residents are found mainly in West End districts, and those of foreign birth are mainly in the City of Westminster (especially the district of Soho), St Pancras and St Marylebone; Italians in Holborn (Saffron Hill), Soho and Finsbury, and Russians in Poles in Stepney and Bethnal Green.

Vital Statistics.—The following table shows the average birth and death rate per thousand at stated periods:

<table>
<thead>
<tr>
<th>Years</th>
<th>Births</th>
<th>Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>1861-1880</td>
<td>35-4</td>

</tr>
</tbody>
</table>

1 Average.

A comparison of the death-rate of London and those of other great towns in England and abroad is given here:
In 1905 the lowest death-rates among the metropolitan boroughs were returned by Hampstead (0-9), Lewisham (1-17), Wandsworth (1-26), Woolwich (1-28), Stoke Newington (1-29), and the highest by Shoreditch (1-69), Finsbury (1-90), Bermondsey (1-97), Bethnal Green (1-98) and Southwark (1-99). The mode is 0-9, and the median of the percentage of inhabitants dwelling in overcrowded tenements shows 2-7 for Lewisham, 6-5 for Wandsworth, 9-5 for Stoke Newington, and 6-4 for Hampstead, against 25-5 for Finsbury and 29-9 for Shoreditch.

Sanitation. As regards sanitation, London is under special regulations. When the statutes relating to public health were consolidated and amended in 1875 London was excluded; and the law applicable to it was specially consolidated and amended in 1891. The London County Council is a central sanitary authority; the City and metropolitan boroughs are sanitary districts, and the Corporation and borough councils are local sanitary authorities. The County Council deals directly with matters where uniformity of administration is essential, e.g. in drainage, housing of working classes, infant life protection, common lodging-houses and shelters, and contagious diseases of animals. With a further view to uniformity it has certain powers of supervision and control over local authorities, and can make bye-laws respecting the inspection of sewers, sanitary conveniences, offensive trades, slaughter-houses and dairies, and prevention of nuisances outside the jurisdiction of local authorities. The medical officer of health for the whole county is appointed by the Council, which also pays half the salaries of its medical officers and sanitary inspectors.

The Council may also act in cases of default by the local authorities, or may make representations to the Local Government Board respecting such default, wherever the Board may direct the Council to withhold payment due to the local authority under the Equalization of Rates Act 1894.

The first act providing for a commission of sewers in London dates from 1531. A certain amount of impetus was given to the work by the Act of 1544, by which the City was carried out, such as the bridging over in 1637 of the river Fleet, which as early as 1307 had become inaccessible to shipping through the accumulation of filth. Scavengers were employed and the works were subdivided into districts under the authority of a sanitary board, which had the power of levying a tax for the purpose. The law was renewed in 1683, and the system of the Metropolitan Board of Works (1856-1888) which expended over six-and-a-half million pounds in various works, is still in operation.

Drainage. A system of main drainage was inaugurated by the Commissioners of Sewers in 1849, but their work proceeded very slowly. It was carried on more effectively by the Metropolitan Board of Works (1856-1888) which expended over six-and-a-half million pounds on the work. The system covers the county of London, West Ham, Penge, Tottenham, Wood Green, and parts of Beckenham, Hornsey, Croydon, Willesden, East Ham and Acton. There are actually two distinct systems, north and south of the Thames, the separate outfall works being north and south of the river, at Barking and Crossness. The clear effluent flows into the Thames, and the siltage is taken out by the outfall works. The annual cost of maintenance of the system exceeds £250,000.

The sanitary authorities are concerned only with the supervision of house drainage, and the construction and maintenance of local sewers discharging into the main system. The Thames and the Lea Conservatories have powers to guard against the pollution of the rivers.

Hospitals.—The Metropolitan Asylums Board, though established in 1867 purely as a poor-law authority for the relief of the sick, insane and infants, has become a central hospital authority for the relief of such persons as are not paupers, suffering from fever, smallpox or diphtheria. Both the Board and the hospital surgeons have drawn up a scheme of sanitary authority for the purpose of epidemic regulations. The local sanitary authorities carry out the provisions of the Infectious Diseases (Notification and Prevention) Acts, which for London are embodied in the Public Health (London) Act 1891. The Board has asylums for the insane at Tooting Bec (Wandsworth), Ealing (for children); King's Langley, Hertfordshire; Caterham, Surrey; and Darent, Kent. There are twelve fever hospitals, including northern and southern convalescent hospitals. For smallpox the Board maintains a smallpox hospital in Islington, and a land establishment at the same place. There are land and river ambulance services.

There are three regular funds in London for the support of hospitals: (1) King Edward VII's Hospital Fund (1897) founded by King Edward VII as Prince of Wales in commemoration of the Diamond Jubilee of Queen Victoria. The funds are held, under royal charter, in conjunction with the Fund in the collection of smallpox admissions. The Order of Mercy wards in the City are held as a reward for distinguished personal service. (2) The Metropolitan Hospital Sunday Fund, founded in 1873, draws the greater part of its revenue from collections in churches on stated occasions. (3) The Metropolitan Hospital Sunday Fund was founded in 1873, and is made up chiefly of small sums collected in places of business, &c. The following is a list of the principal London hospitals with dates of foundation.

1. General Hospitals with Medical Schools (all of which, with the exception of those of the Seamen's Hospital, are schools of London University):
   - Charing Cross: Agar Street, Strand (1820).
   - Guy's: St Thomas Street, Southwark (1724).
   - King's College: Lincoln's Inn Fields (1839).
   - Middlesex: Mortimer Street, Marylebone (1745).
   - North London, or University College: Gower Street (1833).
   - Royal Free: Gray's Inn Road (1828; on present site, 1842).
   - London School of Medicine for Women: St Bartholomew's Hospital (1853; refounded 1854). St George's: Hyde Park Corner (1733).
   - St Mary's: Paddington (1853).
   - St Thomas': Lambeth (1213; on present site, 1871).
   - St Mary's Hospital: St George's; Paddington (1821).
   - Westminster, facing the Abbey (1720; on present site, 1834).

2. General Hospitals without Schools:
   - Great Northern Central: Islington (1856; on present site, 1837).
   - Metropolitan: Hackney (1836).
   - Poplar Hospital for Accidents (1845).
   - West London: Hammersmith Road (1856).

3. Hospitals for Special Diseases:
   - Brompton Consumption Hospital (1841).
   - Cancer Hospital: Brompton (1851).
   - City of London Hospital for diseases of the chest: Bethnal Green (1848).
   - East London Hospital for Children and Dispensary for Women: Shadwell (1868).
   - Hospital for Sick Children: Bloomsbury (1859).
   - London Fever Hospital: Shadwell (1868).
   - National Hospital for Paralysed and Epileptics: Bloomsbury (1859).
   - Royal Infirmary for Incurables: Putney (1854).
   - Royal London Ophthalmic Hospital: City Road (1864; on present site, 1890).

(See also separate articles on boroughs.)
to acquire the eight undertakings concerned its scheme was opposed not only by the companies but by the county councils and local authorities outside the County of London. The Council had a scheme of bringing water to London from Wales, in view of increasing demands for water in the City and suburbs. This proposal was opposed from the headwaters of the Wye, the Towey and the Usk, and the total cost was estimated to exceed fifteen millions sterling. The capacity of existing sources, however, was deemed sufficient by a Royal Commission (the Water and the Thames Commission) of 1864, which had been endorsed by a further Commission under Lord Llandaff. The construction of large storage reservoirs was recommended, and this work was put in hand jointly by the New River, West Middlesex and Great West Public Waterworks, in accordance with the Act of 1863. Under the administration, Lord Llandaff's Commission recommended the creation of a Water Trust, and in 1902 the Metropolitan Water Act created the Trust and gave it the powers to acquire the undertakings of the eight companies, and of certain local authorities. It consists of 66 members appointed by the London County Council (14), the City of London and the City of Westminster (2 each), the other Metropolitan boroughs (6), Middlesex, Essex, Kent and Surrey (1 each), boroughs of West Ham (2), various other groups of other boroughs and urban districts, and the Thames and the Lea Conservancies. The first election of the Board took place in 1903. The 24th of June, 1904, was the date fixed on which control passed to the Board, and in the meantime a Court of Arbitration adjudicated the claims of the companies for compensation for the acquisition of their properties.

The supply is maintained generally throughout "Water London," although a suspension between certain hours has been occasionally necessitated, as in 1895 and 1898, when, during summer droughts, the East London supply was so affected. During these periods other companies had a surplus of water, and, in 1898, an agreement was reached providing for the interconnexion of systems. The Thames and Lea are the principal sources of supply, but the Kent and (partially) the New River Company draw supplies from the Thames. The gas lighting was supplied by the various companies, which were allowed to compete in efficacy, but both the Royal Commissions decided that water as supplied to the consumer was generally of a very high standard of purity. The expenditure of the Water Board for 1907-1908 amounted to £2,845,265. Debt charges absorbed £1,512,718 of this amount.

Public baths and washhouses are provided by local authorities under various acts between 1836 and 1896, which have been adopted by the Board of Works. The supply is provided by the principal waterworks, and in 1726 the corporation took the matter in hand, levying a rate. Gas-lighting was introduced on one side of Pall Mall in 1807, and in 1810 the Gas Light & Coke Company received a charter, and developed the West India Docks Work at Rotherhithe. The Board of Work continued to the 18th century, and seven other companies soon after, Wasteful competition ensued until in 1857 an agreement was made between the companies to restrict their services to separate localities, and the Gas Light & Coke Company then became the only supplier of gas; the other companies, when they were capable of acquiring the gas-lighting north of the Thames, while a considerable area in the south was provided for by another great gas company, the South Metropolitan. Various acts passed by the Board of Works have laid down laws as to the quality and standard of gas.

Gas must be supplied at 16 candle illuminating power, and is officially tested by the chemists' department of the London County Council. The amalgamations mentioned were effected subsequently to the Act of 1886, and in 1893 the Board of Works evolves a Joint committee to consider the supply of gas to the City and Guilds of London Institute, Gresham College, also maintains various technical institutions. The establishment of the technical institutions was that of Mr QUINN Hogg (1880) in Regent Street, where a striking statue by George Frampton (1906) commemorates him. The general scope of the polytechnics is to give instruction both in general studies and in the special arts and sciences of the age, through lectures and laboratories, instructive entertainments and exhibitions, and facilities for bodily and mental exercise (gymnasium, libraries, &c.). Other similar institutions exist primarily for special purposes, as the City & Guilds of London Institute, near Fleet Street, and the Art Workers' Guild, established in 1919. The London County Council maintains a number of industrial schools and reformatory schools, both in London and in the country, for children who have shown or are likely to be misled into a career towards lawlessness. In addition, there are a number of special institutions, such as the Royal School of Art Needlework and the School of Art Woodcutting; the City and Guilds Institute maintains special institutions at some of its colleges, and art schools are also generally maintained by local authorities.

V. EDUCA TION AND RECREATION

Education.—The British and Foreign School Society (1808) and the National Society (1811), together with the Ragged Schools Union (1844), were the only special organizations providing for the education of the poorer classes until 1870. To meet the demands for elementary instruction with population, was beyond the powers of these societies, and the churches and the various charitable institutions. Thus a return of 1871 shows that the schools were capable of accommodating only 39% of the children of school-going age. In 1870, however, a School Board had been created in this duty, and this body carried on much good work during its thirty-four years of existence. In 1903 the Education Act put into operation by the Education Act of 1902 of bringing education within the scope of municipal government. The County Council was created a local education authority, and given control of the school system. It was composed of a board of education, the members of which were elected by the Board of Education. This scheme must allow of at least a majority of the committee, and must provide for the education of the children of both sexes. Schools must be under the management of whom the borough council and the County Council share in the following proportions:

(a) Board or provided schools; borough council, two-thirds; county council, one-third; (b) Volunteer or non-aided schools; the foundation, two-thirds; borough council and county council, each one-sixth. The total number of public elementary schools was 963 in 1905, with 752,487 scholars on the register. Other institutions include: (a) Girls' technical training; (b) County and urban schools for blind, deaf and defective children. Instruction for teachers is provided in pupil teachers' centres (preparatory), and in residential and day training colleges.

There are about 100 Powell and 663 special schools. To the act of 1903 the County Council had educational powers under the Technical Instruction Acts which enabled it to provide technical education through a special board, merged by the National Education Act 1907 into the Board of Education, the City and Guilds of London Institute, Gresham College, also maintains various technical institutions. The establishment of the technical institutions was that of Mr Quinn Hogg (1880) in Regent Street, where a striking statue by George Frampton (1906) commemorates him. The general scope of the polytechnics is to give instruction both in general studies and in the special arts and sciences of the age, through lectures and laboratories, instructive entertainments and exhibitions, and facilities for bodily and mental exercise (gymnasium, libraries, &c.). Other similar institutions exist primarily for special purposes, as the City and Guilds of London Institute, near Fleet Street, and the Art Workers' Guild, established in 1919. The London County Council maintains a number of industrial schools and reformatory schools, both in London and in the country, for children who have shown or are likely to be misled into a career towards lawlessness. In addition, there are a number of special institutions, such as the Royal School of Art Needlework and the School of Art Woodcutting; the City and Guilds Institute maintains special institutions at some of its colleges, and art schools are also generally maintained by local authorities.

Green; the Cambridge House, Camberwell Road; Toyne Hall, Whitechapel; Mansfield House, Canning Town; the Robert Browning Settlement, Southwark; and the Passmore Edwards Settlement, St Pancras. There are also several women's settlements of a similar character, such as St Mary's Settlements (see WESTMINSTER). London University, founded in 1873, is both a medical and educational institution (called East London College) erected and subsequently extended mainly through the liberality of the Drapers' Company and of private donors.

In early times the priories and other religious houses had generally grammar schools attached to them. Those at St Peter's, Westminster, and St Paul's, attained a fame which has survived, while other religious foundations, such as St John's College (see WESTMINSTER), had schools. Archbishop Whitgift and many other men of eminence received education. Certain of the schools were re-endowed after the dissolution of the monasteries and priories, or were converted to schools by Sir Thomas More and the charter of his foundation, made in 1516, was restored to Charterhouse School. The Mercers' School, Dowgate, was originally founded by Sir Thomas Acon, which was sold to the Mercers' Company in 1522, and that body should maintain the school. The City of London School, founded in Milk Street, Cheapside, by the City Corporation in 1835, occupies modern buildings at Holborn. The City of London School, founded in 1746, occupies modern buildings at Holborn. The City School, founded in 1746, occupies modern buildings at Holborn.

Secondary schools. — Certain of the schools founded in the 18th century have both middle and modern schools to the admittance of the children of families engaged in commerce and trade. The Royal Institution, Albermarle Street, founded in 1799, maintains a library and laboratories and promotes research in connexion with the experimental sciences. The Royal Horticultural Society maintains gardens at Wisley, Surrey, and has an exhibition hall in Vincent Square, Westminster. The exhibitions of the Royal Academy of Arts, at Burlington House in Vincent Row, are held at Park Royal, near Willesden. The Zoological Society maintains a collection of living specimens in the Zoological Gardens, Regent's Park, a popular resort.

Art Galleries, Libraries. — In the British Museum London possesses one of the most celebrated collections in the world, originated in 1753 by the purchase of Sir Hans Sloane's collection and library by the government. The great building in Bloomsbury Square, London, 36 feet high, the Ionic portico, houses the collections of antiquities, coins, books, manuscripts, and contains the reading-rooms for the use of readers. The natural history branch was removed to a building at South Kensington (the Natural History Museum) in 1881, where the zoological, botanical and mineralogical exhibits are kept. Close to this is the National Gallery in Trafalgar Square. This magnificent collection was originated in 1824, and the building dates from 1838, but has been recently enlarged. The enlarged building contains a portrait gallery, adjoining it, dates from 1896, but the nucleus of the collection was formed in 1858. The munificence of Sir Henry Tate provided the gallery, commonly named after him, by the Thames near Blackfriars Bridge, where is the national collection of British art. The Wallace collection of paintings and objects of art, in Hertford House, Manchester Square, was bequeathed to the nation by the widow of Sir Richard Wallace in 1867. Dulwich College possesses series of paintings and examples of sculpture, bequeathed by Sir P. F. Bourgeois in 1811. There are also notable collections of pictures in several of the mansions of the nobility, government buildings, halls of the City Companies and elsewhere. The Victoria and Albert Museum, founded in 1852, is one of the largest and most noteworthy. It is held annually at Burlington House from the first Monday in May to the first Monday in August. It consists mainly of paintings, but includes a few drawings and examples of sculpture. Earlier in each year exhibitions of works by deceased British artists and by old masters are held, and the Gibson and Diploma Galleries are permanent exhibitions. At the Guildhall special exhibitions are...
COMMERCIAL LONDON

949

held from time to time. There are a number of art galleries in and about Bond Street and Piccadilly, Regent Street and Pall Mall, such as the New Gallery, where periodical exhibitions are given by the New English Art Club, the Royal Society of Painters in Water-Colours, the Royal Institute of Painters in Water-Colours, and other societies and art dealers.

Municipal provision of public libraries under acts of 1892 and 1893 is general throughout London, and these institutions are exceeded in number for purposes both of reference and of loan. The acts are extended to include the provisions of museums and art galleries, but the borough councils have not as a rule availed themselves of this extension. The London County Council administers the Horniman Museum at Forest Hill, Lewisham. The City Corporation maintains the fine Guildhall library and museum. A few free libraries are supported by donations and subscriptions or charities. Besides the Government reference libraries at the British Museum and the Public Record Office there are other such libraries, of a specialized character, as at the Patent Office and the Record Office. Among lending libraries should be noticed the London Library in St James's Square, Pall Mall.

4. Places of Entertainment.—The principal London theatres lie between Piccadilly and Temple Bar, and Holborn and Victoria Street, the majority being in Shaftesbury Avenue, the Haymarket, the neighbourhood of Charing Cross and the Strand. At St. James's and West Kensington, the commercial and business quarters, for protracted periods, but there are numerous fine houses in other parts of London which are generally occupied by a succession of touring companies presenting either revivals of popular plays or plays in the legitimate dramatic style. Among the permanent institutions are the various music halls (variety theatres) are in Shaftesbury Avenue, Piccadilly Circus, Leicester Square and the Strand. The Covent Garden theatre is the principal home of grand opera; the building, though spacious and well adapted for such performances, is in some respects inferior in comfort to those of other capitals, but during the opera season the theatre is brilliant. The chief halls devoted mainly to concerts are the Royal Albert Hall, close to the South Kensington museums, and an open-air hall in Langham Place, known as the Albert Hall. For a long time the St James's Hall (demolished in 1905) between Regent Street and Piccadilly was the chief concert hall. Oratorio is usually given in the Albert Hall, the vast area of which is especially suited for a large chorus and orchestra. There, too, is the Crystal Palace (g.s.). This hall, built over the area of a few acres adjoining high ground at Sydenham, and visible from far over the metropolis, is devoted not only to concerts, but to general entertainment, and the extensive grounds give accommodation for a variety of sports and amusements. Among other popular places of entertainment may be mentioned the exhibition grounds and buildings at Earl's Court; similar grounds at Shepherd's Bush, where a Franco-British Exhibition was held in 1908, an Imperial Exhibition in 1909, and an Anglo-Japanese in 1910; the grand hall in the West Kensington was the location for the celebrated water-page exhibition of Madame Tussaud in Marylebone Road; the Alexandra Palace, Muswell Hill, an institution resembling the Crystal Palace; and the Agricultural Hall, Islington, where agricultural and other exhibitions have been held since 1862. The Crystal Palace, unfortunately, was taken down in 1906, and the permanent conjuring entertainment for which (besides picture exhibitions) it was noted was removed elsewhere. Theatres, music halls, concert halls and other places of entertainment are maintained locally in several parts of the City and Borough of London, by the City Corporation and borough councils for their respective areas, and by various bodies as electors on the property or by virtue of a licence for stage-plays is granted by the lord chamberlain under the Act 1843. The council provides for inspection of places of entertainment in respect of precautions against fire, structural safety, &c.; the principal clubs are in and about Piccadilly and Pall Mall (see CLUB). A club for soldiers, sailors and marines in London, called the Union Jack Club, was opened in Waterloo Road by King Edward VII. in 1907.

5. Open Spaces: Administration.—The administration of parks and open spaces in and round London, topographical details of the principal of which are given in Section I., is divided between the Office of Works, the London County Council, the City Corporation and borough councils. The Office of Works controls the principal parks, the County Council controls the larger parks and open spaces not under Government or City control, and the borough councils the smaller; while the City Corporation controls certain public grounds outside the City of London. There are a few rules for the controlling particular open spaces, as the following list of public grounds exceeding 50 acres (in 1910) will show:

1. Under the Office of Works:—
- Green Park
- Greenwich Park
- Hyde Park
- Kensington Gardens
- Regent's Park
- St. James's Park

Total: 54 acres

2. Under the Office of Works:—
- Woolwich Common

Total: 159 acres

3. Under the London County Council:—
- Avery Hill, Eltham
- Battersea Park
- Blackheath
- Bostall Heath and Woods, Woolwich

Total: 1,384 acres

Brockwell Park, Herne Hill
Chatham Common
Clissold Park
Dalwhirch Park
Finborough Park
Hacnkey Marsh
Hainault Forest, Essex
Hamstead Heath
Ladywell Park, Lewisham
Marble Hill, Twickenham
Millfields, Hackney
Parliament Hill
Peckham Rye Park
Pumstead Common
Southwark Park
Streatham Common
Stoting Beech Common
Tooting Graveney Common
Victoria Park, East London
Wandsworth Common
West Ham Park

Wimbledon and Putney Commons are under a board of conservators. The London County Council's parks and open spaces increased in number from 40 in 1890 to 114 in 1907, and in acreage from 2,656 to 5,006 in the same years. The expenditure in 1907-1908 was £131,592, which sum included £11,987 for bands. (See also separate articles on Knightsbridge, Regent's Park, etc.)

Bathing (at certain hours) and boating are permitted in the ornamental waters in several of the parks, music is provided and much attention is paid to the protection of waterfowl and other birds, while the tennis courts and various buildings are maintained in some places as botanical gardens. Surplus plants and cuttings are generally distributed without charge to educational or charitable institutions, and to the poor. Provision is made for cricket, football and other games in a number of the parks. Large gatherings of spectators are attracted to the first-class cricket matches played at Lord's ground, St John's Wood, by the Marylebone Club and the Middlesex County teams, Eton College against Harrow School, and Oxford against Cambridge University. Popular races are run to the Meynell Cup and the Middlesex Cup, and the Leyton ground for those of the Essex club. In the Crystal Palace grounds the final match for the English Association Football Cup is generally played, and huge crowds from both the metropolitan and the provinces witness the game. At Queen's Club, West Kensington, the annual Oxford and Cambridge athletic meeting and others take place, besides football matches, and there is covered accommodation for tennis and other games. Professional association football teams are maintained locally in several parts of the City and borough, and much popular interest is taken in their matches. Rugby football is upheld by such notable teams as Blackheath and Richmond. Fashionable society takes its pastimes at such centres as the grounds of the Regent's Park club, at Lords' ground, at the Hurlingham club, at The White Horse in Barnes, respectively, where polo and other games are played; and Rotten Row, the horse-track in Hyde Park, is the favourite resort of riders. In summer, boating on the lovely reaches of the Thames above the metropolis forms the recreation of thousands. The growth of popular interest in the cycle, and later of the motor-car, has been a principal factor in the wide development of a tendency to leave London during the 'week-end,' that is to say, as a rule, for Saturday and Sunday. With many this is a practice at all seasons, and the railway companies foster the habit by means of tickets at reduced fares to all parts. The water-plying-places of the Sussex, Kent and Essex coasts, and pre-eminently Brighton, are specially favoured for these brief holidays.

VI. COMMERCE

Port of London.—The extent of the Port of London has been variously defined for different purposes, but for those of the Port Authority it is taken to extend from Teddington Lock to a line between Yantlet Creek in Kent and the City Stone opposite Canvey Island and in Essex. London Bridge is to outward appearance the up-river limit of the port. There are wharves and a large carrying trade in barges above this point, but below it the river is crowded with shipping, and extensive docks open on either hand.

Towards the close of the 19th century evidence was accumulating that the development of the Port of London was not keeping pace with that of shipping generally. In 1900 a Royal Commission was appointed to investigate the existing administration of the port, the alleged inadequacy of accommodation for vessels and kindred questions, and to advance a scheme of
reform. The report, issued in 1902, showed apprehension to be well founded. The river, it was ascertained, was not kept sufficiently dredged; the re-export trade was noted as showing an especially serious decline, and the administration was found to suffer from decentralization. The recommendations of the Commission included the creation of a single controlling authority to take over the powers of the Thames Conservancy Watermen’s Company, and Trinity House and the docks of the companies already detailed. This authority, it was advised, should consist of 40 members, of whom 11 should be nominated by the London County Council and 3 by the Corporation of the City (supposing these bodies to accept certain financial responsibilities proposed in the direction of river improvements), 3 by the governors of the Bank of England from the mercantile community, 2 by the London Chamber of Commerce, and 1 each by the Admiralty, Board of Trade and Trinity House. The remaining members should be, 2 elected representatives of shippers, 3 large owners, the railway companies interested, &c. Rival schemes, however, were proposed by the London County Council, which proposed to take over the entire control through a committee, by the City Corporation, which suggested that it should appoint 10 instead of 3 members to the new board; and by the London Chamber of Commerce, which proposed a Harbour Trust of ex-officio and elected members. The Thames Conservancy also offered itself as the public authority. In 1902 a Mansion House Conference was convened by the lord mayor and a deputation was appointed which in 1903 pressed the solution of the matter upon the government.

A noteworthy scheme to improve the condition of the Thames, first put forward in 1902-1903, was that of constructing a dam with four locks across the river between Gravesend and Tilbury. The estimated cost was between three and four millions sterling, to be met by a toll, and it was urged that a uniform depth, independent of tides, would be ensured above the dam, that delay of large vessels wishing to proceed up river would thus be obviated, that the river would be relieved of pollution by the tides, and the necessity for constant dredging would be abolished. This “barrage scheme” was discussed at considerable length, and its theoretical advantages were not universally admitted. The scheme included a railway tunnel beneath the dam, for which, incidentally, a high military importance was claimed.

In 1904 the Port of London Bill, embodying the recommendations of the Royal Commission with certain exceptions, was brought forward, but it was found impossible to carry it through. In 1908, however, the Port of London Act was passed (1908). This act came into force in 1909 and provided for the establishment of a Port Authority, the constitution of which is detailed below, which took over the entire control of the port, together with the docks and other property of the several existing companies.

The principal dock companies, with the docks owned by them, were as follows:

1. London and India Company. This company had amalgamated all two docks of the side of the river above the Millwall Docks. Following the river down from the Tower these docks, with dates of original opening and existing extent, are—St Katherine’s (1828; 103 acres), London (1869; 574 acres), West India, covering the northern part of the peninsula called the Isle of Dogs (1869; 111 acres), East India, Blackwall (1806; 38 acres), Royal Victoria and Albert Docks (1876 and 1886 respectively), parallel with the river along Bugshy’s and Woolwich Reaches, nearly 3 m. in distance (181 acres) and Tilbury Docks, 25m. below London Bridge, constructed in 1886 by the East and West India Docks Company (65 acres). Tilbury Docks are used by the largest steamers trading with the port.

2. Millwall Docks (1868), in the south part of the Island of Dogs, are 36 acres in extent.

3. Surrey Commercial Docks, Rotherhithe (Bermondsey), occupy a peninsula between the Lower Pool and Limehouse Reach. There have also been the Rotherhithe since the middle of the 17th century. The total area is 176 acres, a large new dock, the Greenland, being opened in 1804.

The principal railways have wharves and through connexions for goods traffic, and by various routes are connected with the docks.

The building being by Lely, but the Corinthian façade was added by Smirke. It includes a museum containing ancient documents and specimens of articles seized by the customs authorities.

The chief authorities concerned in the government of the Port of London till 1909 were:

1. Thames Conservancy.—For conservancy purposes, regulation of navigation, removal of obstruction, dredging, &c.

2. City Corporation.—Port sanitary purposes from Teddington Lockwards.

3. Trinity House.—Pilotage, lighting and buoying from London Bridge seawards.

4. The Watermen’s and Lightermen’s Company.—The licensing authority for watermen and lightermen in the waters of the Thames and its tributaries.

Besides these authorities, the London County Council, the Board of Trade, the Admiralty, the Metropolitan and City Police, police of riparian boroughs, Kent and Essex Fisheries Commissioners, all the dock companies and others played some part in the government and public services of the port.

Port Authority.—The Port of London Authority, as constituted by the act of 1908, is a body corporate consisting of a chairman, vice-chairman, 17 members elected by payers of dues, wharfingers and owners of river craft, 1 member elected by wharfingers exclusively, and 10 members appointed by the following existing bodies—Admiralty (one); Board of Trade (two); London County Council (two from among its own members and two others); City Corporation (one from among its own members and one other); Trinity House (one). The Board of Trade and the County Council must each, under the act, consult with representatives of labour as to the appointment of one of the members, in order that labour may be represented on the Port Authority. The first election was held, and members were actually under the act, appointed by the Board of Trade. The undertakings of the three dock companies mentioned above were transferred to and vested in the Port Authority, an equivalent amount of port stock created under the act being issued to each. The Port Authority has full powers to authorize construction works. All the rights, powers and duties of the Thames Conservancy, so far as concerns the Thames below Teddington Lock, were transferred to the Port Authority under the act, as also were the powers of the Watermen’s Company in respect of the registration and licensing of vessels, and the regulation of lightermen and watermen. The Port Authority fixes the port rates, which, however, must not in any two consecutive years exceed one-thousandth part of the value of all imports and exports or a three-thousandth of the value of goods discharged from or taken on board vessels not within the premises of a dock. Preferential dock charges are prohibited for a port fund established under the act. The authority has powers to borrow money, but for certain purposes in this connexion, as in other matters, it can only act subject to the approval of the Board of Trade.

Commerce.—The following figures may be quoted for purposes of comparison at different periods:

Value of Exports of Home Produce (1840), £158,826,071; (1874), £77,232,118; (1886), £53,600,829; (1902–1905 average), £90,925,204.

Imports (1880), £141,442,907; (1902–1905), £174,059,316.

These figures point to the fact that London is essentially a mart, and neither is it, nor is the especial outlet for, a large manufacturing centre; hence imports greatly exceed exports.

Vessels entered and cleared (foreign and colonial trade):

In the coastwise trade, in 1881, 38,953 vessels of 4,545,904 tons entered; in 1905, 43,704 vessels of 6,555,618 tons; but these figures include vessels trading within the Thames estuary (ports of London, Rochester, Colchester and Faversham), which latter returns do not.

Omitting such vessels, therefore, the number which entered in the coastwise trade in 1905 was 16,358 of 6,374,832 tons.

Business.—The City has been indicated as the business centre of the metropolis. Besides the Royal Exchange, in the building...
of which are numerous offices, including "Lloyd's," the centre of the shipping business and marine insurance, there are many exchanges for special articles. Among these are the Commercial Exchange in Mark Lane, where the privilege of a fair was originally granted by Edward I.; the Wool Exchange, Coleman Street; the Coal Exchange, Lower Thames Street; the Shipping Exchange, Billiter Street; and the auction mart for landed property in Tokenhouse Yard. The Hop Exchange is across the river in Southwark. In Mincing Lane are the commercial salerooms. Beside the Bank of England there are many banking houses; and the name of Lombard Street, commemorating the former money dealers of Lombardy, is especially associated with them. The majority of the banks are members of the Commercial House, Post Office Court, where a daily exchange of drafts representing millions of pounds sterling is effected. The Royal Mint on Tower Hill. The Stock Exchange is in Cabell Court, and numbers of brokers have their offices in the vicinity of the Royal Exchange and the Bank of England.

Manufactures and Retail Trade.—No part of London can be pointed out as essentially a manufacturing centre and yet it is a strong tendency for manufacturing firms to establish their factories outside the metropolis. There are, however, several large breweries, among them the Marstons, London, and the Euston Brewery, which is in the area of Brixton. The furniture industry in Bermondsey, the extensive pottery works in the vicinity of Lambeth, there are chemical works on the Lea, and paper-mills on the river. In the whole of the metropolis (confined to factories) have long been associated with particular localities. Thus, clock-makers and metal-workers are congregated in Finsbury Square, Clerkenwell and in Islington; Hatton Garden, near Holborn Viaduct, is the centre of the diamond trade; cabinet-making is carried on in Bethnal Green, Shoreditch and in the vicinity; and large numbers in the East End are employed in the manufacture of silk. Weaving is carried on in the district of Spitalfields (see Spitalfields). The most important daily newspapers and their offices are located. Carriage and motor-car warehouses congregate in Long Acre. In Tottenham Court Road are the showrooms of several large upholstering and furnishing firms. Of the streets most frequented on account thereof are the fashionable shops Bond Street, Regent Street, Oxford Street, Sloane Street and High Street, Kensington, may be included. In the East End is Euston Road, which is the cheapest of the second-hand clothing, flowers and vegetables, and the large number of shops and offices in the streets on movable stalls by costermongers and hawkers.

Markets.—The City Corporation exercises a control over the major London markets, which dates from the close of the 12th century. In 1417 the majority of the members of the City were elected, and the vestries of the central and aldermen. The markets thus controlled are:

Central Markets. Smithfield, for meat, poultry, provisions, fruit, vegetables, flowers and fish. These extend over a great area north of Newgate Street and east of Farringdon Road. The extensive underground railway sidings. A market for horses and cattle existed here at least as early as the time of Henry II. Leadenhall Market, Leadenhall Street, City, for poultry and meat.

This market was in existence before 1417 when it came into the possession of the City.

Borough Market, by the Thames immediately above the custom. Formerly a point of anchorage for small vessels, it was made a free market in 1699.

Smithfield Hay Market.

Metropolitan Coal Market, Copenhagen Fields, Islington.

Dyers' Market (foreign cattle).

Spitalfields Market (fruit, vegetables and flowers).

Skidwell Market (fish).

Of other markets, the Whitechapel Hay Market and Borough Market, Southwark, are under the control of trustees; and Woolwich Market is under the control of the Mechanics' Institute. In London (besides the great mart in the west of London for flowers, fruit and vegetables), there are smaller mart in the hands of private owners. It appears that have been used as a market by the Corporation. In the 17th century. Scenes of remarkable activity may be witnessed here and at Billingsgate in the early hours of the morning when the stock is brought in and the wholesale distributions are carried on.

VII. Government

Administration before 1888.—The middle of the 19th century found the whole local administration of London still of a medieval character. Moreover, as complete reform had always been steadily resisted, homogeneity was entirely wanting. Outside the City itself a system of local government can hardly be said to have existed. Greater London (in the sense in which that name might then have been applied) was governed by the inhabitants of each parish in vestry assembled, save that in some instances parishes had elected select vestries under the provisions of the Vestries Act 1845. In neither case had the vestry powers of town management. To meet the needs of particular localities, commissioners or trustees having such powers had been from time to time created by local acts. The resulting chaos was remarkable. In 1855 these local acts numbered 250, administered by not less than 300 bodies, and by a number of persons serving on them computed at 10,000. These persons were either self-elected, or elected for life, or both, and therefore in no degree responsible to the ratepayers. There were two bodies having jurisdiction over the whole metropolis except the City, namely, the officers appointed under the Metropolitan Building Act of 1844, and the Metropolitan Commissioners of Sewers, appointed under the Commissioners of Sewers Act 1845. Neither body was responsible to the ratepayers. To remedy this chaotic state of affairs, the Metropolitan Management Act 1855 was passed. Under that act a vestry elected by the ratepayers of each parish was established for each parish in the metropolis outside the City. The vestries so elected for the twenty-two larger parishes were constituted the local authorities. The fifty-six smaller parishes were grouped together in fifteen districts, each under a district board, the members of which were elected by the vestries of the constituent parishes. A central body, styled the Metropolitan Board of Works, having jurisdiction over the whole metropolis (including the City) was also established, the members of which were elected by the Common Council of the City, the vestries and district boards, and the previously established local board of Woolwich (q.v.). Further the area of the metropolis for local government purposes was for the first time defined, being the same as that adopted in the Commissioners of Sewers Act, which had been taken from the area of the weekly bills of mortality. The Metropolitan Board of Works was also given certain powers of supervision over the vestries and district boards, and superseded the commissioners of sewers as authority for main drainage. By an act of the same session it became the central authority for the administration of the Building Acts, and subsequently had many additional powers as well as conferred upon it. The vestries and district boards became the authorities for local drainage, paving, lighting, repairing and maintaining streets, and for the removal of nuisances, &c.

Acts of 1888 and 1899.—An objection to the Metropolitan Board of Works soon became manifest, inasmuch as the system of election was indirect. Moreover, some of its actions were open to such suspicion that a royal commission was appointed to inquire into certain matters connected with the working of the board. This commission issued an interim report in 1888 (the final report did not appear until 1892), which disclosed the inefficiency of the board in certain respects, and also indicated the existence of corruption. Reform following immediately. Already in 1884 Sir William Harcourt had attempted to create the metropolis a municipal borough under the government of a single council. But in 1888 the Local Government Act, dealing with the area of the metropolis as a separate county, created the London County Council as the central administrative body, possessing not only the powers of an ordinary county council, but also extensive powers of town management, transferred to it from the abolished Board of Works. Here, then, was the central body, under their direct control, which inhabitants of London had hitherto lacked. The question of subsidiary councils remained to be settled. The wealthier metropolitan parishes became discontented with the form of local government to which they remained subject, and in 1895 Kensington and Westminster petitioned to be created boroughs by the grant of charters under the Municipal Corporation Acts. These, however, were inapplicable to London, and it was realized
LONDON (GOVERNMENT)

that the bringing of special legislation to bear on special cases (as the petition of these two boroughs would have demanded) would be inexpedient as making against homogeneity. Metropolitan boroughs. Metropolitan boroughs enumerated at the outset of this article. The county of London may thus be regarded from the administrative standpoint as consisting of twenty-nine contiguous towns, counting the City of London. As regards the distribution of powers and duties between the County Council and the Borough Councils, and the constitution and working of each, the underlying principle may be briefly indicated as giving all powers and duties which require uniformity of action throughout the whole of London to the County Council, and powers and duties that can be locally administered to the Borough Councils.

Summary of Administrative Bodies.—The administrative bodies of the County of London may now be summarized:

1. London County Council.—Consists of 118 councillors, 2 elected by each parliamentary division (but the City of London elects 4); and 19 aldermen, with chairman, vice-chairman and deputy-chairman, elected in council. Triennial elections of councillors by householders (male and female) on the rate-books. Aldermen hold office for 6 years.

2. Metropolitan Boroughs.—Councils consist of a mayor and aldermen and councillors in proportion as 1 to 6. The commonest number of councillors exceeded by 66 and 60 (see separate article on each borough). Triennial elections.

3. Corporation of the City of London.—The legislation of 1855, 1886 and 1899 left the government of the small area of the City in the hands of the London Corporation. Its body is by statute, at least this much (q.v.: the City being divided into City and Metropolitan areas), merged with the Court of Common Council, which is the principal administrative body. Its scope may be briefly indicated as including (a) duties exercised elsewhere by the Borough Councils, and by the London County Council (for example, the police in the whole area, the market and the parks in the City (City boundaries); and (b) peculiar duties such as control of markets and police. The election of common councilmen, whose institution, according to the terms of the ancient charters, in a manner, typically resembles a general division of the two wards of the City. An alderman (q.v.) of each ward (save that the wards of Cripplegate within and without, share one) is elected for life. The Lord Mayor (q.v.) is elected by the Court of Aldermen from two aldermen nominated in the Court of Common Hall by the Livery, one (and made drawn from the members of the ancient livery or livery companies) of each ward, which, through their control over the several trades or manufactures, had formerly an influence over the government of the city which from the time of Edward III. was paramount.

Non-administrative Arrangements.—The Local Government Act of 1888 dealt with the metropolis for non-administrative purposes as it did for administrative, that is to say, as a separate county. The apparatus of quarter-sessions, justices, coroners, sheriffs, etc., were thus brought into line with other counties, except in so far as the ordinary organization is modified by the existence of the central criminal court, the metropolitan police, police courts and magistrates, and a paid chairman of quarter-sessions.

The chief courts for the trial of criminal cases are the Central Criminal Court and the Court of Quarter-sessions. The Central Court.

Assizes, was established by an act of 1834. There are twelve sessions annually, under the Lord Mayor, aldermen and judges. They were formerly held in the "Old Bailey" sessions-house, but a fine new building from designs of E. W. Mountford took the place of this in 1906. Quarter-sessions for the county of London are held thirty-six times annually, for the north side of the Thames at the Sessions-house in Clerkenwell (Finsbury), and for the south side at the Cripplegate (City), and Southwark. For judicial purposes Westminster City and the county of London in 1889, and the Liberty of the Tower was abolished in 1894. The separate court of the Lord Mayor and Aldermen is held at the Guildhall. The Metropolitan police courts are fourteen in number, namely—Bow Street, Covent Garden; Clerkenwell; Great Marlborough Street (Westminster); Greenwich and Woolwich; Lambeth; Marylebone; North London, Stoke Newington Road; Southwark; South Western, Lavender Hill (Battersea); Thames, Arbour Street East (Stepney); West Ham; West London, Vernon Street (Fulham); Westminster, Vincent Square; Worship Street (Shoreditch). The police courts of the City are held at the Mansion House, the Lord Mayor or an alderman sitting as magistrate, and at the Guildhall, where the aldermen preside in rotation. The prisons within the metropolis are Brixton, Holloway, Pentonville, Wandsworth and Wormwood Scrubs. In the county of London there are 12 coroners' districts, 19 petty sessional divisions (the City forming a separate one) and 13 county court districts (the City forming a separate one). The boundaries of these divisions do not in any way correspond with each other, or with the police divisions, or with the borough or parish boundaries. The registration county of London coincides with the administrative county.

Parliamentary Representation.—The London Government Act contains a saving clause by which "nothing in or done under this act shall be construed as altering the limits of any parliamentary borough or parliamentary county." The parliamentary boroughs are thus in many cases named and bounded differently from the metropolitan boroughs. The parliamentary arrangements of each metropolitan borough are indicated in the separate articles on the boroughs. In the following list the boroughs which extend outside the administrative county of London are noted. Each division of each borough, or each borough where not divided, returns one member, save that the City of London returns two members.

(a) North of the Thames. 

Part of the Westminster parliamentary division of Surrey is in the metropolitan borough of Wandsworth.

Ecclesiastical Divisions and Denominations.—London north of the Thames is within the Church of England bishopric of London, the bishop's palace being at Fulham. In this diocese, which covers nearly the whole of Middlesex and a very small portion of Hertfordshire, are the suffragan bishoprics of Islington, Kennington and Stepey. The bishop of Southwark was created in 1904, having been previously a suffragan bishopric in the diocese of Rochester. The county contains 612 ecclesiastical parishes. Westminster is the seat of the Roman Catholic archbishopric in England, and Southwark is a bishopric. Among the numerous chapels of dissenting bodies there may been the Church of England, Congregational, on Holborn Viaduct; the Metropolitan Tabernacle, Baptist, in Southwark, the creation of which was the outcome of the labours of the famous preacher Charles Spurgeon (d. 1892); and Wesley's Chapel, City Road, in which the home of John Wesley; his house, which adjoins the chapel, being open as a memorial museum. In 1903 the Wesleyans acquired the site of the Royal Aquarium, near Westminster Abbey, for the erection of a central hall. The Great Synagogue of the Jews is in St James's Place, Aldgate.
LONDON

The headquarters of the Salvation Army are in Queen Victoria Street, City. There are numerous foreign churches, among which may be mentioned the French Protestant churches in Monmouth Road, Bayswater and Soho Square; the Greek church of St Sophia, Moscow Road, Bayswater; and the German Evangelical church in Montpelier Place, Brompton Road, opened in 1904.

O. J. R. H.

VIII. Finance

In addition to the provisions that have been mentioned above (Section VII.), the London Government Act 1899 simplified administration in two respects. The duties of overseers in London had been performed by most diverse bodies. In some parishes overseers were appointed in the ordinary manner; in others the vestry, by local acts and by orders under the Local Government Act 1894, was appointed to act as, or empowered to appoint, overseers, whilst in Chelsea the guardians acted as overseers. The act of 1899 swept away all these distinctions, and constituted the new borough councils in every case the overseers for every parish within their respective boroughs, except that the town clerk of each borough performs the duties of overseers with respect to the registration of electors.\(^1\) Again, with regard to rates, there were in all cases three different rates leviable in each parish—the poor rate, the general rate, and the sewers rate—whilst in many parishes in addition there was a separate lighting rate. From the sewers rate and lighting rate, land, as opposed to buildings, was entitled to certain exemptions. Under the act of 1899 all these rates are consolidated into a single rate, called the general rate, which is assessed, made, collected and levied as the poor rate, and the interests of persons previously entitled to exemptions are safeguarded. Further, every precept sent by an authority in London for the purpose of obtaining money these authorities include the London County Council, the receiver of the Metropolitan Police, the Central Unemployed Body and the Boards of (regional) charity, which has ultimately to be raised out of a rate within a borough is sent directly to the county council of the borough instead of filtering through other authorities before reaching the overseers.

\(^1\) Over 200 local acts were repealed by schemes made under the act of 1899.

The only exceptions to this rule are: (1) precepts issued by the local government board for raising the sums to be contributed to the metropolitan common poor fund; and (2) precepts issued by poor law authorities representing two or more poor-law unions; in both these cases the precept has of necessity to be sent to the guardians. The metropolitan borough councils make one general rate, which includes the amount necessary to meet their own expenditure, as well as to meet the demands of the various precepting authorities. There was thus raised in the year 1906–1907 a sum of £15,395,956 (in 1898–1899 the amount was £10,401,441); of this £11,012,424 was for central rates, which was subdivided into £9,790,275 for county services and £3,082,149 for local services, leaving a balance of £4,381,523, strictly local rates. The total local expenditure of London for the year 1906–1907 was £24,703,087 (in 1898–1899 it was only £14,768,757), the balance of £9,761,734 being made up by receipts-in-aid and imperial subventions. This expenditure is divided among the following bodies:

- London County Council...
- Metropolitan Borough Councils...
- Boards of Guardians...
- Metropolitan Water Board...
- Metropolitan Police...
- City Corporation...
- Metropolitan Asylums Board...
- Central (Unemployed) Body...
- Overseers—City of London...
- Market Trustees (Southwark)...
- Local Government Board—Common Poor Fund...

LONDON

metropolitan police district in 1909–1909, £26,739, and in the county of London (excluding the City) £161,806. A complete re-valuation of properties in the county of London is made every five years, valuation lists being prepared in duplicate by the borough councils acting as overseers of the parishes in their respective boroughs, and are revisied by statutory assessment committees, who hear any objections by ratepayers against their valuation. These lists when revised are sent to the clerk of the County Council, who publishes the totals. By the Metropolitan Poor Act 1867, the metropolitan common poor fund rateable fund, 95+ boards at the new London rate was made in lieu of the exchequer grant in aid of local rates, and amounted in 1906-1907 to £619,489. Finally, in 1894, the fund called the Equalization Fund was established. This fund is raised by the rate of 6d. in the pound on the assessable value of the county of London, and redressed among the boroughs in proportion to their population. It amounted in 1906-1907 to £1,094,046. But, in spite of attempts at equalization, rates remain very unequal in London, and varied in 1908 from 6s. 2d. in St Anne’s, Westminster, to 11s. 6d. in Poplar. The London County Council levied in 1909-1910 to meet its estimated expenditure for the year a total rate of 35-75d.; 14-50d. of this was for general county purposes, 19-75d. for education purposes and 2-50d. for special county purposes. The preceding tables show the estimated annual income and expenditure of the London County Council for 1909-1910.

Besides the annual expenditure of the various authorities large sums have been borrowed to defray the cost of works of a permanent nature, such as public buildings, libraries, vaccination services, &c., which have considerably increased and shows a tendency to go on increasing, although certain safeguards against too ready borrowing have been imposed. Every local authority has to obtain the sanction of some higher authority, more raising of money and there is in the various rates of interest on borrowing. Metropolitan borough councils have to obtain the sanction of the Local Government Board to loans for baths, washhouses, public libraries, sanitary conveniences and certain other purposes under the Public Health Acts; for certain other purposes; the decision of the Board is, however, and for all other purposes that of the London County Council; poor law authorities, the metropolitan asylums board, the metropolitan water board and the central (unemployed) body require the sanction of the Local Government Board, the Metropolitan Water Board, and the Home Office, and the London County Council that of parliament and the Treasury. The following table gives the net loans outstanding of the several classes of local authorities at London at the 31st of March 1908:

AUTHORITIES.—Full details and figures relating to the finance of London will be found in the parliamentary papers Local Taxation Returns (England and Wales), part iv. published annually; Returns relating to the London County Council, published annually; the annual report of the Committee of the Metropolitan Water Board; the annual report of the Metropolitan Police district; and the annual reports of the Metropolitan police accounts. The publications of the London County Council, especially the trams accounts, the annual estimates, London Statistics, and the Financial Abstract (to years ended 31st March 1908) have much valuable information. (T. A. L.)

IX. HISTORY

1. British and Roman to a.d. 449.—There is practically no record of British London, and considerable difference of opinion exists among antiquaries as to its very existence. Bishop Stillingfleet held that London was of Roman foundation and not older than the time of Claudius (Origines Brit., 1685, p. 43); and Dr Guest affirmed that the notion of a British town having “preceded the Roman camp has no foundation to rest upon” (Archaeological Journal, xxii. 180). J. R. Green expressed the same opinion in The Making of England (p. 101). On the other side Kemble held that it was difficult to believe that Caius Lunden was an unimportant place even in Caesar’s day (Saxons in England, ii. 266); and Thomas Lewin believed that London had attained prosperity before the Romans came, and held that it was probably the capital of Cassivellanus, which was taken and sacked by Julius Caesar (Archaeologia, xi. 59). The origin of London will probably always remain a subject of dispute for want of decisive facts.

The strongest reason for believing in a British London is to be found in the name, which is undoubtedly Celtic, adopted with little alteration by the Romans. It is also difficult to believe that Londinium had come to be the important commercial centre described by Tacitus (A.D. 61) if it had only been founded a few years before the conquest of Claudius.

The discovery by General Pitt Rivers in 1867 of the remains of pile dwellings both on the north and on the south of the Thames gives ground for an argument of some force in favour of the date of the foundation of London having been before the Roman occupation of Britain. Of Roman London we possess so many remains that its appearance can be conjectured with little difficulty.

During the centuries when Britain was occupied by the Romans (A.D. 43-400) there was ample time for cities to grow from small beginnings, to overflow their borders and to be more than once rebuilt. The earliest Roman London must have been a comparatively small place, but it probably contained a military fort of some kind intended to cover the passage of the river.

The Roman general Paulinus Suevonius, after marching rapidly from Wales to put down a serious insurrection, found Londinium unfitted for a base of military operations, and therefore left the place to the mercy of Boudica, who entirely destroyed it, and killed the inhabitants. After this the need of fortifying Londinium must have been apparent, and a walled city of small dimensions arose soon after the defeat of the British queen. The earliest Roman city probably extended as far as Tower Hill on the east, and there is reason to believe that it did not include any ground to the west of Leadenhall. The excavations at the latter place in 1881 threw great light upon the early history of London. The foundation walls of a basilica were discovered, and from the time when it was built to that when it was last used may have been devoted to public uses. How far with the first wall was placed it is difficult to guess. One help towards a settlement of the question may be found in the discovery of burial places. As it was illegal in Roman times to bury within the walls, we are forced to the conclusion that the places where these sepulchral remains have been found were at one time extramural. Now no such remains have been found between Gracechurch Street and the Tower. The northern wall was placed by Roach Smith somewhere along the course of Cornhill and Leadenhall Street. The second extension of the city westwards was probably to Wallbrook.

In the latest or third Roman enclosure the line of the wall ran straight from the Tower to Aldgate, where it bent round somewhat to Bishopsgate. On the east it was bordered by the district subsequently called the Minories and Houndsditch. The line from Bishopsgate ran eastward to St Giles’s churchyard (Cripplegate), where it turned to the south as far as Falcon square; again westerly by Aldersgate round the site of the Greyfriars (afterwards Chris’s Hospital) towards Giltspur Street, then south by the Old Bailey to Aldgate, and then down to the Thames, where Dr Edwin Freshfield suggests that a Roman fortress stood on the site of Baynard’s Castle. This is most probable, because the Romans naturally required a special protection on the river at the west as well as at the east. So in later times when William the Conqueror planned the Tower he gave the site at the western extremity to his follower Ralph Baynard, where was erected the stronghold known as Baynard’s Castle. Roach Smith pointed out that the enclosure indicated above gives dimensions far greater than those of any other town in Britain. There can be no doubt that within the
walls there was originally much unoccupied space, for with the single exception of the larger circuit south of Ludgate, up to where the river Fleet ran, made in 1276 for the benefit of the Black Friars, the line of the walls, planned by the later Romans, remained complete until the Great Fire (1666). The Thames formed the natural barrier on the south, but the Romans do not appear to have been content with this protection, for they built a wall here in addition, which remained for several centuries. Portions of this wall have been discovered at various times.

It is difficult even to guess when the third wall was erected. The emperor Theodosius came to London from Boulogne to mature his plan for the restoration of the tranquillity of the province. As Theodosius is said to have left Britain in a sound and secure condition, it has been suggested that he was due the wall of the later Londinium, but there is little or no evidence for this opinion, and according to an old tradition Constantine the Great walled the city at the request of his mother Helen, presumed to be a native of Britain. There is, however, some evidence in favour of the supposition that the wall was built at a much earlier date. It is not improbable that early in the 2nd century the wall was finished at the west portion and enclosed a cemetery near Newgate. Sir William Tite, in describing a tessellated pavement found in 1854 on the site of the Excise Office (Bishopsgate Street), expresses the opinion that the finished character of the pavement points to a period of security and wealth, and fixes on the reign of Hadrian (A.D. 117–138), to which the silver coin found on the floor belongs, as the date of its foundation.

The historians of the Roman Empire have left us some particulars of the visits of emperors and generals to Britain, but little or nothing about what happened in London, and we should be more ignorant than we are of the condition of Londinium if it had not been that a large number of excavations have been made in various parts of the city which have disclosed a considerable amount of its early history. From these remains we may guess that London was a handsome city in the reign of Hadrian, and probably then in as great a position of importance as it ever attained. This being so, there seems to be reason in attributing the completed walls to this period.

The persistence of the relics of the walls of London is one of the most remarkable facts of history. Pieces of the wall are to be seen in various parts of the city, and are frequently found when extensive excavations are made for new buildings. In some places where the Roman wall is not to be seen there still exist pieces of the old wall that stand upon Roman foundations. In Amen Court, where the residential houses or minor canons are situated, there stretches such a piece of wall, dividing the gardens of the Court from the Old Bailey. Of the few accessible fragments of the Roman wall still existing special mention may be made of the bastion in the churchyard of St Giles's, Cripplegate; a little farther west is a small fragment in St Martin's Court, Ludgate Hill (opposite the Old Bailey), but the best specimen can be seen near Tower Hill just out of George Street, Trinity Square. Early in the 20th century a fragment nearly 40 ft. long, together with the base of a bastion, was brought to light in digging for the foundation of some large warehouses in Camomile Street, at a depth of 10 ft. below the level of the present street. A considerable portion of the old wall was laid bare by the excavations for the new Post Office in St Martin's-le-Grand. From a comparison of the fragments with the descriptions of Woodward, Maitland and others, who in the early part of the 18th century examined portions of the wall still standing, we learn that the wall was from 9 to 12 ft. thick, and formed of a core of rough rubble cemented together with mortar (containing much coarse gravel) of extraordinary hardness and tenacity, and a facing for the most part of stone—Kentish rag, freestone or ironstone—but occasionally of flints; about 2 ft. apart are double layers of tiles or bricks which serve as bonding courses. The wall appears to have been about 20 ft. high, the towers from 40 to 50 ft. high, but when described only the base was Roman. Upon that was raised a wall of rough rubble rudely faced with stone and flint, evidently a medieval work and about 2½ ft. thick; then succeeded a portion wholly of brick, terminating in battlements topped with copings of stone.

Although the course of the later Roman walls is clear, we do not know with any certainty the position of the Roman gates. They were not the same as the medieval gates which have left the record of their names in modern London nomenclature. It follows, therefore, that the main streets also are not in line with the Roman ways, except perhaps in a few instances. Many ineffectual attempts have been made to connect the Watling street in the city with the great Roman road so named in medieval times. The name of the small street is evidently a corruption, and in the valuable Report of the MSS. of the Dean and Chapter of St Paul's (Ninth Report of the Historical MSS. Commission, Appendix, p. 4) the original name is given as "Atheling Street," and instances of this spelling are common in the 13th century. The form Watling Street seems to occur first in 1307; Stow spells it Watheling Street (Kingsford's edition of Stow's Survey, 1908, vol. ii. p. 352). Sir William Tite gave reasons for believing that Bishopsgate Street was not a Roman thoroughfare, and in the excavations at Leadenhall the basilica to which allusion has already been made was found apparently crossing the present thoroughfare of Gracechurch Street. Tite also agreed with Dr Stukeley's suggestion that on the site of the Mansion House (formerly Stock's Market) stood the Roman forum, and he states that a line drawn from that spot as a centre would pass by the pavements found on the site of the Excise Office. Besides the forum Stukeley suggested the sites of seven other buildings—the Arch Palatina guarding the south-eastern angle of the city where the Tower now stands, the grove and temple of Diana on the site of St Paul's, &c. No traces of any of these buildings have been found, and they are therefore purely conjectural. Stukeley's industrious researches into the history of Roman London cannot be said to have any particular value, although at one time they enjoyed considerable vogue. As to the Temple of Diana, Sir Christopher Wren formed an opinion strongly adverse to the old tradition of its existence (Parentalia, p. 266). Although we know that the Christian church was established in Britain during the later period of the Roman domination, there is little to be learnt respecting it, and the bishop Restitutus, who is said to have attended an Ecclesiastical Council, is a somewhat mythical character. In respect to the discovery of the position of the Roman gates, the true date of the Antonini Itinerarium (q.e.) is of great importance, as it will be seen from it that Londinium was a part of the road from London to Boulogne, as also described in the portion relating to Britain. This would be remarkable if the work dated back to the 2nd century. Probably in the later, as in the earlier time, Londinium had the usual four gates of a Roman city, with the main roads to them. The one on the east was doubtless situated near where Aldgate afterwards stood. On the south the entrance to Londinium must always have been near where London Bridge was subsequently built. On the west the gate could not have been far from the place afterwards occupied by Newgate. As to Ludgate there is reason to believe that if there was an opening there in Roman times it was merely a postern. On the north the gate may have been near Bishopsgate or at Aldersgate. If we take from the Itinerary the last station before Londinium in all the routes we shall be able to obtain some idea of the position of the gate entered from each route by drawing a line on the map of London to the nearest point. Ammianus Marcellinus (about A.D. 390) speaks twice of Londinium as an ancient town to which the honourable title of Augusta had been accorded. Some writers have been under the misapprehension that this name for a time superseded that of Londinium. The anonymous Chronicler of Ravenna calls the place Londinium Augusta, and doubtless this was the form adopted.

The most interesting Roman relic is "London Stone." It has generally been supposed to be a "milliarium" or central point for measuring distances, but Sir Christopher Wren believed it
was part of some more considerable monuments in the forum (Parentalia, pp. 265, 266). Holinshed (who was followed by Shakespeare in 2 Henry VI., act 4 sc. 6) tells us that when Cade, in 1450, forced his way into London, he first of all proceeded to London Stone, and having struck his sword upon it, said in reference to himself and in explanation of his own action, “Now is Mortimer lord of this city.” Mr H. C. Coote, in a paper published in the Trans. London and Middlesex Arch. Soc. for 1878, points out that this act meant something to the mob who followed the rebel chief, and was not a piece of foolish acting. Mr Laurence Gomme (Primitive Folk-Moots, pp. 155, 156) takes up the matter at this point, and places the tradition implied by Cade’s significant action as belonging to times when the London Stone was, as other great stones were, the place where the suitors of an open-air assembly were accustomed to gather together and to legislate for the government of the city. Corroborative facts have been gathered from other parts of the country, and, although more evidence is required, such as we have is strongly in favour of the supposition that the London Stone is a prehistoric monument.

One of the most important questions in the history of London that requires settlement is the date of the building of the first bridge, that is whether it was constructed by Britons or by Romans. If the Britons had not already made the bridge before the Romans arrived it must have been one of the first Roman works. As long as there was no bridge to join the north and south banks of the Thames the great object of Roman rule remained unfulfilled. This object was the completion of a system of roads connecting all parts of the Empire with Rome.

Dr Cassius, who lived in the early part of the 3rd century (Hist. Rom. lib. x. c. 20), states that there was a bridge over the Thames at the time of the invasion of Claudius A.D. 43), but he places it a little above the mouth of the river (“higher up”). The position is vague, but the mouth of the Thames in these early times may be considered as not far from the present position of London Bridge. Sir George Airy held that this bridge was not far from the site of London Bridge (Proceedings of Institut. Civil Engineers, xlii. 120), but Dr Guest was not prepared to allow that the Britons were able to construct a bridge over a tidal river such as the Thames, some 300 yds. wide, with a difference of level at high and low water of nearly 20 ft. He therefore suggested that the bridge was constructed over the marshy valley of the Lea, probably near Stratford. It needs some temerity to differ from so great an authority as Dr Guest, but it strikes one as surprising that, having accepted the fact of a bridge made by the Britons, he should deny that these Britons possessed a town or village in the place to which he supposes that Aulus Plautius retired.

As the Welsh word for “bridge” is “pont,” and this was taken directly from the Latin, the inference is almost conclusive that the Britons acquired their knowledge of bridges from the Romans. Looking at the stage of culture which the Britons had probably reached, it would further be a natural inference that there was no such thing as a bridge anywhere in Britain before the Roman occupation; but, if Dion’s statement is correct, it may be suggested as a possible explanation that the increased intercourse with Gaul during the hundred years that elapsed between Julius Caesar’s raids and Claudius Caesar’s invasion may have led to the construction of a bridge of some kind across the Thames at this point, through the influence and under the guidance of Roman traders and engineers. If so, the word “pont” may have been borrowed by the Britons before the commencement of the Roman occupation. Much stronger are the reasons for believing that there was a bridge in Roman times. Remains of Roman villas are found in Southwark, which was evidently a portion of Londinium, and it therefore hardly seems likely that a bridge-building people such as the Romans would remain contented with a ferry. Roach Smith is a strong advocate for the bridge, and remarks, “It would naturally be erected somewhere in the direct line of road into Kent, which I cannot but think pointed towards the site of Old London Bridge, both from its central situation, from the general absence of the foundations of buildings in the approaches on the northern side, and from discoveries recently made in the Thames on the line of the old bridge” (Archaeologia, xxix. 166). Smith has, however, still stronger arguments, which he states as follows: “Throughout the entire line of the old bridge, the bed of the river was found to contain ancient wooden piles; and when these piles, subsequently to the erection of the new bridge, were pulled up to deepen the channel of the river, many thousands of Roman coins, with abundance of broken Roman tiles and pottery, were discovered, and immediately beneath some of the central piles brass medallions of Aurelius, Faustina and Commodus. All these remains are indicative of a bridge. The enormous quantities of Roman coins may be accounted for by consideration of the well-known practice of the Romans to make these imperishable monuments subservient towards perpetuating the memory, not only of their conquests, but also of those public works which were the natural result of their successes in remote parts of the world. They may have been deposited either upon the building or repairs of the bridge, as well as upon the accession of a new emperor” (Archaeological Journal, i. 113). At the beginning of the 5th century the Roman legions left Britain, and the Saxon Chronicle gives the exact date, stating that never since A.D. 409 “have the Romans ruled in Britain”—the chronicler setting down the Roman sway at 470 winters and dating from Julius Caesar’s invasion. We learn that in the year 418 “the Romans collected all the treasures that were in Britain, and hid some of them in the earth, that no man might afterwards find them, and conveyed some with them into Gaul.”

The First London Bridge.

The Saxon Settlement.

The Saxon (449-1066).—We are informed in the Saxon Chronicle that about A.D. 449 or 450 the invaders settled in Britain, and in 457 Hengist and Hwicca fought against the Britons at Crayford, driving them out of Kent. The vanquished fled to London in terror and apparently found a shelter there. After this entry there is no further mention of London in the Chronicle for a century and a half. This silence has been taken by some historians of weight to imply that London practically ceased to exist. Dr Guest asserted “that good reason may be given for the belief that even London itself for a while lay desolate and uninhabited” (Archaeological Journal, xix. 219). J. R. Green and Mr Loffte strongly supported this view, and in Sir Walter Besant’s Early London (1908) the idea of the desolation of the city is taken for granted.

In answer to this contention it may be said that, although the silence of the Chronicle is difficult to understand, it is almost impossible to believe that the very existence of the most important city in the country could suddenly cease and the inhabitants disappear without some special notice. Battles and scenes of destruction are so fully described in other instances that one must believe that when nothing is related nothing special occurred. No doubt the coming of the Saxons, which entirely changed the condition of the country, must have greatly injured trade, but although there was not the same freedom of access to the roads, the Londoners had the highway of the river at their doors. Although the Saxons hated towns and refused to settle in London, they may have allowed the original inhabitants to continue their trade on condition that they received some share of the profits or a tribute. The only question really is whether London being an exceptional city received exceptional treatment.

Along the banks of the Thames are several small havens whose names have remained to us, such as Rotherhithe, Lambeth (Lambeth), Chelchith (Chelsea), &c., and it is not unlikely that the Saxons, who would not settle in the city itself, associated themselves with these small open spots. Places were thus founded over a large space which otherwise might have remained unsettled.

If what is here suggested really occurred it may be that this separation of London from the surrounding country originated the remarkable position of London with its unparalleled privileges, which were continued for many centuries and kept it not
only the leader among cities but distinct from all others. Laurence Gomme, in *The Governance of London* (1907), opposes the view that the city was for a time left deserted (as view which, it may be remarked, is a comparatively modern one, probably originating with Dr Guest). H. C. Coote in his *Romans of Britain* elaborated a description of the survival of Roman influence in English institutions, but his views did not obtain much support from London historians. Mr Gomme's contention is to some extent a modification of Mr Coote's view, but it is original in the illustrations that give it force. Londinium was a Roman city, and (as in the case of all such cities) was formed on the model of ancient Rome. It may therefore be expected to retain evidence of the existence of a Pomerium and Territorium as at Rome. The Pomerium marked the rebuilt space around the walls. Gomme refers to an open space outside the western wall of Dorchester still called the Punnery as an indication of the Pomerium in that place; and he considers that the name of Mile End, situated 1 m. from Aldgate and the city walls, marks the extent of the open space around the city as a Pomerium. This fact throws a curious light upon the growth of the "Liberties." It has always been assumed that the nome location of the first institution of these liberties. If this open space was from the earliest times attached to the city there would be no need when it was built upon for any special act to be passed for its inclusion in London. "The Territorium of the city was its special property, and it extended as far as the limits of the territory of the nearest Roman city or as near thereto as the natural boundaries." This explains the position of Middlesex in relation to London. In connexion with these two features of a Roman city supposed to be found in Ancient London the author argues for the continuity of the city through the changes of Roman and Saxon dominion.

One of the most striking illustrations of the probable continuity of London history is to be found in the contrast between York and London. This is only alluded to in Gomme's book, but it is elaborated in an article in the *Cornhill Magazine* (November 1906). These two were the chief Roman cities in Britain, one in the north and the other in the south. They are both equally good examples of important cities under Roman domination. York was deserted and occupied by the Saxons, and there not only are the results of English settlement clear but all records of Roman government were destroyed. In London the Saxon stood outside the government for centuries, and the acceptance of the Roman survival explains much that is otherwise unintelligible.

Gomme finds important evidence of the independence of London in the existence of a merchant law which was opposed to Anglo-Saxon law. He reprints and discusses the celebrated *Judicia Civitatis Londinie* of King Æthelstan’s reign—"the ordinance" (as it declares itself) "which the bishop and the reeves belonging to London have ordained." He holds that the Londoners passed "their own laws by their own citizens without reference to the king at all;" and in the present case of a king who according to Kemble "had carried the influence of the crown to an extent unexampled in any of his predecessors." He adds: "What happened afterwards was evidently this: that the code passed by the Londoners was sent to the king for him to extend its application throughout the kingdom, and this is done by the eleventh section." The view originated by Gomme certainly explains many difficulties in the history of the transition from Roman to English London, which have hitherto been overlooked by historians.

When the city is next referred to in the *Saxon Chronicle* it appears to have been inhabited by a population of heathens. Under the date 604 we read: "This year Augustine consecrated two bishops: Mellitus and Justus. He sent Mellitus to preach baptism to the East Saxons, whose king was called Sebert, son of Ricolle the sister of Æthelbert, and whom Æthelbert had then appointed king. And Æthelbert gave Mellitus a bishop’s see in Lundenevic and to Justus he gave Rochester, which is twenty-four miles from Canterbury." The Christianity of the Londoners was of an unsatisfactory character, for, after the death of Sebert, his sons who were heathens stirred up the multitude to drive out their bishop. Mellitus became archbishop of Canterbury, and London relapsed into heathenism. In this, the earliest period of Saxon history recorded, there appears to be no relic of the Christianity of the Britons, which at one time was well in evidence. What became of the cathedral which we may suppose to have existed in London during the later Roman period we cannot tell, but we may guess that it was destroyed by the heathen Saxons. Bede records that the church of St Paul was built by Æthelbert, and from that time to this a cathedral dedicated to St Paul has stood upon the hill looking down on Ludgate.

After the driving out of Mellitus London remained without a bishop until the year 656, when Cedd, brother of St Chad of Lichfield, was invited to London by Sigebert, who had been converted to Christianity by Finn, bishop of the Northumbrians. Cedd was consecrated bishop of the East Saxons by Finan and held the see till his death on the 26th of October 664. He was succeeded by Wini, bishop of Winchester, and then Earl Eormund (or St Eckenward), whose shrine was one of the chief glories of old St Paul’s. He died on the 30th of April 693, a day which was kept in memory in his cathedral for centuries by special offices. The list of bishops from Cedd to William (who is addressed in the *Conqueror’s Charter*) is long, and each bishop apparently held a position of great importance in the government of the city.

In the 7th century the city seems to have settled down into a prosperous place and to have been peopled by merchants of many nationalities. We learn that at this time it was the great mart of slaves. It was in the fullest sense a free-trading town; neutral to a certain extent between the kingdoms around, although the most powerful of the kings conquered their feebler neighbours. During the 8th century, when a more settled condition of life became possible, the trade and commerce of London increased in volume and prosperity. A change, however, came about towards the end of the century, when the Scandinavian freebooters known as Danes began to harry the coasts. The Saxons had become law-abiding, and the fierce Danes treated them in the same way as in former days they had treated the Britons. In 871 the chronicler affirms that Alfred fought nine great battles against the Danes in the kingdom south of the Thames, and that the West Saxons made peace with them. In the next year the Danes went from Reading to London, and there took up their winter quarters. Then the Mercians made peace with them. In 886 Alfred overcame the Danes, restored London to its inhabitants, rebuilt its walls, renannexed the city to Mercia, and committed it to Ethelred, alderman of Mercia. Then, as the chronicler writes, "all the Angle race turned to him (Alfred) that were not in bondage of the Danish men." In 896 the Londoners came off victorious in their encounters with the Danes. The king obstructed the river so that the enemy could not bring up their ships, and they therefore abandoned them. The Londoners broke up some, and brought the strongest and best to London. In 917 Æthelred, the alderman of the Mercians, who had been placed in authority by Alfred, died, and Edward the Elder took possession of London and Oxford, "all the land which thereto belonged."

Under Æthelstan we find the city increasing in importance and general prosperity. There were then eight mints at work, a fact which exhibits evidence of great activity and the need of coin for the purposes of trade. The folk-moot met in the precincts of St Paul's at the sound of the bell of the famous bell-tower, which also rang out when the armed levy was called to march under St Paul's banner. For some years after the decisive battle of Brunanburh (A.D. 937) the Danes ceased to trouble the country. Fire, however, was almost as great an enemy to London as the Dane. Fabyan when recording the entire destruction of London by fire in the reign of Æthelred (981) makes this remarkable statement—"Ye shall understand that this daye the cytie of London had more housyng and buyldings.
from Ludgate toward Westminister and lytel or none wher the-chief or hert of the cite is now, except that in dyvers places were housyn, but they stod without order."

In the reign of Æthelred II., called the Unready (but more correctly the Redless), the Danes were more successful in their operations against London, but the inhabitants resisted stoutly. Snorre the Icelander tells us that the Danes fortified Southwark with ditch and rampart, which the English assailed in vain. In 982 London was burnt, and in 994 Olaf and Sweyn (the father of Canute) came with ninety-four ships to besiege it. They tried to set the city on fire, but the townsman did them more harm than they "ever weened." The chronicler piously adds that "the holy Mother of God on that day manifested her mercy to the townsman, and delivered them from their foes." The Danes went from the town and ravaged the neighbourhood, so that in the end the king and his witan agreed to give sixteen thousand pounds to be relieved of the presence of the enemy. This was the origin of the Danegeld. In the year 1000 the Danes frequently attacked London, but they had no success, and fared ill in their attempts. The Londoners withstood Sweyn in 1013, but in 1016 and they submitted and gave him hostages. Three years after this, Æthelred died in London, and such of the witan as were there and the townsman chose Edmund Ironside for king, although the witan outside London had elected Canute. Canute's ships were then at Greenwich on their way to London, where they soon afterwards arrived. The Danes at once set to work to dig a ditch by Southwark, and then dragged their ships to the west side of the bridge. They were able after this to keep the inhabitants from going either in or out of the town. In spite of all this, after fighting obstinately both by land and by water, the Danes had to raise the siege of London and take the ships to the river Orwell. After a glorious reign of seven months Edmund died in London, and Canute became master of England. The tribute which the townsman of London had to pay was £10,000, about one-seventh of the amount which was paid by all the rest of the English nation. This shows the growing importance of the city. From this time there appears to have been a permanent Danish settlement in London, probably Aldwych, referred to below.

There is little more to be said of the history of Saxon London than that Edward the Confessor held his Witanagemot there. On his death the Witan which had attended his funeral elected to succeed him Harold, the foremost man in England, and the king who had attempted to check the spread of the Norman influence fostered by the Confessor. After his defeat and death on the hill on the Sussex Downs then called Senlac, the duke of Normandy had the country at his mercy, but he recognized the importance of London's position, and moved forward with the greatest caution and tact.

Before proceeding with the history of London during the Norman period it is necessary to say something of the counties more especially connected with London.

The walled city of London was a distinct political unit, although it owed a certain allegiance to that of the kingdoms around it which was the most powerful for the time being. This allegiance frequently changed, but London retained its identity and individually all through. Essex seems seldom to have held an independent position, for when London first appears as connected with the East Saxons the real power was in the hands of the king of Kent. According to Bede, Wini, being expelled from his bishopric of Wessex in 635, took refuge with Wulphhere, king of the Mercians, of whom he purchased the see of London. Hence the Mercian king must then have been the lord of London. Not many years afterwards the king of Kent again seems to have held some jurisdiction here. From the laws of the Kentish kings Lhothhere and Eadrinc (673-682) we learn that the Win-rēve was an officer of the king of Kent, who exercised a jurisdiction over the Kentish men trading with or at London, or was appointed to watch over their interests.

The origin of the two counties in which London is chiefly situated opens up an interesting question. It is necessary to remember that London is older than these counties, whose names, Middlesex and Surrey, indicate their relative positions to the city and the surrounding county. We have never record of their settlement nor of the origin of their names. Both must have been peopled from the river. The name Middle Saxons plainly shows that Middlesex must have been settled after the East and West Saxons had given their names to their respective districts. The name Surrey clearly refers to the southern position of the county.

Reference has already been made to a Danish settlement, and there seems some reason for placing it on the ground now occupied by the parishes of St Clement Danes and St Giles's. For many centuries this district between London and Westminster was a kind of "no man's land" having certain archaic customs. Gomme in his Governance of London (1907) gives an account of the connexion of this with the old village of Aldwich, a name that survived in Wych Street, and has been revived by the London County Council in Aldwych, the crescent which leads to Kingsway.

3. Norman (1066-1154).—To return to the condition of things after the great battle. The citizens of London were a divided body, and Duke William knowing that he had many friends in the city saw that a waiting game was the best for his cause in the end. The defeated chiefs retired on the city, led by Angsar the Staller, under whom as sheriff the citizens of London had marched to fight for Harold at Senlac. They elected Edgar Atheling, the grandson of Edmund Ironside, as king, which the Saxon Chronicle says "was indeed his natural right." On hearing of this action William marched towards London, when the citizens rallied forth to meet him. They were supported by the Norman horse, but with such loss to the latter that the duke thought it imprudent to lay siege to the city at that time, and he retired to Berkamptead. 1 It is reported that William sent a private message to Angsar asking for his support. The result was that Edgar and Earl Edwin and Morkere and "the best men of London" repaired to Berkamptead, where they submitted themselves and swore fealty to the Conqueror.

Thus ends the Saxon period, and the Norman period in London begins with the submission of the citizens as distinct from the action of the rest of the kingdom, which submission resulted soon afterwards in the Conqueror's remarkable charter to William the bishop and Gosfrith the portreeve, supposed to be the elder Geoffrey de Mandeville. A great change was at once made both in the appearance and in the government of the city under Norman rule. One of the earliest acts of the Conqueror was to undertake the erection of a citadel which should overawe the citizens and give him the command of the city. The Tower was situated at the eastern limit of the city, and not far from the western extremity Castle Baynard was built.

The position of the city grew in importance, but the citizens suffered from severe laws and from serious restrictions upon their liberties. In August 1077 occurred a most extensive fire, such a one, says the Chronicle, as never was before since London was founded. This constant burning of large portions of the city is a marked feature of its early history, and we must remember that, although stone buildings were rising on all sides, these were churches, monasteries, and other public edifices; the ordinary houses remained as before, small wooden structures. The White Tower, the famous keep of the Tower of London, was begun by Gundulph, bishop of Rochester, c. 1078. In 1083 the old cathedral of St Paul's was begun on the site of the church which Æthelbért is said to have founded in 610. But four years afterwards the chronicler tells us "the holy monastery of St Paul, the episcopal see of London, was burnt, and many other monasteries, and the greatest and fairest part of the whole

1 A valuable article on "The Conqueror's Footprints in Domesday" was published in the "English Historical Review" in 1898 (vol. xiii. p. 17). This article contains an account of Duke William's movements after the battle of Senlac between Enfield, Edmonton, Tottenham and Berkamptead.
LONDON

959

city." In this same year (1087) William the Conqueror died. In 1090 a tremendous hurricane passed over London, and blew down six hundred houses and many churches. The Tower was injured, and a portion of the roof of the church of St Mary-le-Bow, Cheapside, was carried off and fell some distance away, being forced into the ground as much as 20 ft., a proof of the badness of the thoroughfares as well as of the force of the wind. William Rufus inherited from his father a love for building, and in the year 1097 he exacted large sums of money from his subjects with the object of carrying on some of the undertakings he had in hand. These were the walling round of the Tower and the rebuilding of London Bridge, which had been almost destroyed by a flood. In 1100 Rufus was slain, and Henry I. was crowned in London. This king granted the citizens their first charter, but this was constantly violated. When St. Stephen, son of Henry II., was crowned on the death of Henry I., he tried successfully to obtain the support of the people of London. He published a charter confirming in general terms the one granted by Henry, and commanding that the good laws of Edward the Confessor should be observed. The citizens, however, did not obtain their rights without paying for them, and in 1139 they paid Stephen one hundred marks of silver to enable them to choose their own sheriffs. In this reign the all-powerfulness of the Londoners is brought prominently forward. Stephen became by the shifting fortune of war a prisoner, and the empress Matilda might, if she had had the wisdom to favour the citizens, have held the throne, which was hers by right of birth. She, however, made them her enemies by delivering up the office of justiciary of London and the sheriffship to her partisan Geoffrey, earl of Essex, and attempting to reduce the citizens to the condition of the rest of the country. This made her influential enemies, who soon afterwards replaced Stephen upon the throne. The Norman era closes with the death of Stephen in 1154.

One of the most striking changes in the appearance of Norman London was caused by the rebuilding of old churches and the building of new ones, and also by the foundation of the great monastic establishments. The early history of the parishes of London is one of great difficulty and complexity. Although some of the parishes must be of great antiquity, we have little authentic information respecting them before the Conquest. The dedications of many of the churches indicate their great age, but the constant fires in London destroyed these buildings. The original churches appear to have been very small, as may be judged from their number. It is not easy, however, to understand how it was that when the first parishes were formed so small an area was attached to each. The parish church of which we have the most authentic notice before the Conquest is St Helen's, Bishopsgate. It was in existence many years before the priory of the nuns of St Helen's was founded. Bishop Stubbs in his Introduction to the Historical Works of Ralph de Diceto writes: "St Paul's stood at the head of the religious life of London, and by its side, at some considerable interval, however, St Martin's le Grand (1056), St Bartholomew's, Smithfield (1123) and the great and ancient foundation of Trinity, Aldgate" (1068). The great Benedictine monastery of Black Monks was situated away from the city at Westminster, and it was the only monastic house subject to the rule of St Benedict in the neighbourhood of London, although the houses of nuns, of which there were many dotted over the suburbs of London, were governed by this rule. In course of time there was a widespread desire in Europe for a stricter rule among the monks, and reforms of the Benedictine rule were instituted at Cluni (910), Chartreuse (about 1080) and Citeaux (1098). All these reforms were represented in London.

Religious foundations.

Cluniac Order.—This order was first brought to England by William, earl of Warren (son-in-law of William the Conqueror), who built the first house at Lewes in Sussex about 1077. The priory of Barking, and the church in Essex, was founded by Alfyn Cild, citizen of London about 1082.

Carthusians.—When this order was brought to England in 1178 the first house was founded at Witham in Somersetshire. In all there were nine houses of the order in England. One of these was the Charterhouse of London which was not founded until 1371 by Sir Walter Manny, K.G.

Cistercians.—It was usual to plant these monasteries in soldiers and unoccupied other houses, even of their own order, was allowed to build within a certain distance of the original establishment. This makes it surprising to learn that there were two separate houses of this order in the near neighbourhood of London. A branch of the order came to England, and about 1125 a new house was founded at Waverley in Surrey. Very shortly after (about 1134) the abbey of Stratford Langthornein Essex was founded by William de Montfichet, who endowed it with all his lordship in West Harrow. It was not until two centuries afterwards that the second Cistercian house in the immediate neighbourhood of London was founded. This was the Abbey of St Mary Graces, East-Minster or New Abbey without the walls of London, beyond Tower Hill, which Edward the Confessor, in imitation in 1330 after a severe scourge of plague (the so-called Black Death).

The two great Military Orders—the Knights Hospitallers of St John of Jerusalem and the Templars—followed the Augustinian rule and were both settled in London. The Hospital or Priory of St John was founded in 1110 by Jordan Bricet and his wife Muriel, outside the northern wall of London, and the original village of Clerkenwell grew up around the buildings of the knights. A few years after this the brethren of the Temple of Solomon at Jerusalem or Knights of the Temple came into being at the Holy City, and they settled first on the south side of Holborn near Southampton Row. They removed to London Bridge or the New Temple in 1184. On the morrow of the order of the temple at Jerusalem, the house in Fleet Street was given in 1315 by Edward II, to Aymer de Valence, earl of Pembroke, at whose death in 1324 the property passed to the knights of the order, who leased the New Temple to the lawyers, still the occupants of the site.

The queen of Henry I. (Matilda or Maud) was one of the chief founders of religious houses, and so great was the number of monasteries built in this king's reign that it was said almost all the labourers became bricklayers and carpenters and there was much discontent in consequence.

4. Plantagenet (1154—1348).—Henry II. appears to have been to a certain extent prejudiced against the citizens of London on account of their attitude towards his mother, and he treated them with some severity. In 1176 the rebuilding of London Bridge with stone was begun by Peter of Colechurch. This was the bridge which was pulled down early in the 19th century. It consisted of twenty stone arches and a drawbridge. There was a gatehouse at each end and a chapel or crypt in the centre, dedicated to St Thomas of Canterbury, in which Peter of Colechurch was buried in 1205. The large amount of building at this time proves that the citizens were wealthy. Fitzstephen, the monk of Canterbury, who visited London about 1180, and who, in writing of the city, describes how beautiful it is, how well it is furnished for commerce, grandeur and magnificence, of the mildness of the climate, the beauty of the gardens, the sweet, clear and salubrious springs, the flowing streams, and the pleasant clack of the watermills. Even the vast forest of Middlesex, with its densely wooded thickets, its covert of game, stags, fallow deer, boars and wild bulls is pressed into the description to give a contrast which shall enhance the beauty of the city itself. Fitzstephen tells how, when the great march that washed the walls of the city on the north (Moorfields) was frozen over, the young men went out to slide and skate and sport on the ice. Skates made of bones have been dug up in this district. This sport was allowed to fall into disuse, and was not again prevalent until it was introduced from Holland after the Restoration.

In spite of Fitzstephen's glowing description we must remember that the houses of London were totally without houses, both streets and streets and wild plants and reeds. These houses were specially liable to be destroyed by fire, and in order to save the city from this imminent danger the famous Assize of Building known as "Fitz-Alywine's Assize" was drawn up in 1189. In this document the following statement was made: "Many citizens, to avoid such danger, built according to their means, on their ground, a stone house, covered and protected by thick tiles against the fury of fire, whereby it often happened that when a fire arose in the city and burnt many edifices and had reached such a house, not being able to injure it, it then became extinguished, so that many neighbours' houses were wholly saved from fire by that house." Various privileges were conceded to those who built in stone, but no provision was made as to the material to be used in
roofing tenements. This Assize, which has been described as the earliest English Building Act, is of very great value from an historical point of view, but unfortunately it had little practical effect, and in 1253 what was called "Fitz-Alwyn's Second Assize," with certain compulsory regulations, was enacted. Therefore everyone who built a house was strictly charged not to cover it with reeds, rushes, stubble or straw, but only with tiles, shingle boards or lead. In future, in order to stop a fire, houses could be pulled down in case of need with an alderman's hook and cord. For the speedy removal of burning houses each ward was to provide a strong iron hook, with a wooden handle, two chains and two strong cords, which were to be left in the charge of the bedel of the ward, who was also provided with a good horn, "loudly sounding."

Richard I. was a popular king, but his fighting in the Holy Land cost his subjects much. London had to pay heavily towards his ransom; and, when the king made his triumphal entry into London after his release from imprisonment, a German nobleman is said to have remarked that had the emperor known of the wealth of England he would have insisted on a larger sum.

The Londoners were the more glad to welcome Richard back in that the head of the regency, Longchamp, bishop of Ely, was very unpopular from the encroachments he made upon the city with his works at the Tower.

The first charter by which the city claims the jurisdiction and conservancy of the river Thames was granted by Richard I. John granted several charters to the city, and it was expressly stipulated in Magna Charta that the city of London should have all its ancient privileges and free customs. The citizens opposed the king during the wars of the barons. In the year 1215 the barons having received intelligence secretly that they might enter London with ease through Aldgate, which was then in a very ruinous state, removed their camp from Bedford to Ware, and shortly after marched into the city in the night-time. Having succeeded in their object, they determined that so important a state should no longer remain in a defenceless condition. They therefore spoiled the religious houses and robbed the monastery coffers in order to have means wherewith to rebuild it. Much of the material was obtained from the destroyed houses of the unfortunate Jews, but the stone for the bulwarks was obtained from Caen, and the small bricks or tiles from Flanders.

Allusion has already been made to the great change in the aspect of London and its surroundings made during the Norman period by the establishment of a large number of monasteries.

A still more important change in the configuration of the interior of London was made in the 13th century, when the various orders of the friars established themselves there. The Benedictine monks preferred secluded sites; the Augustinians did not cultivate seclusion so strictly; but the friars chose the interior of towns by preference. At the beginning of the 13th century the remarkable evangelical revival, instituted almost simultaneously by St Dominic and St Francis, swept over Europe.

The four chief orders of Mendicant friars were magnificently housed in London:-

Blackfriars.—The Black, Preaching or Dominican Friars came to England in 1211 and their first house was at Oxford. Shortly after this, they came to London and settled in Holborn near Lincoln's Inn, where they remained for many years. In 1276 they removed to the neighbourhood of Baynard Castle, and their house gave a name to a London district which it still retains.

Greyfriars.—The Greyfriars, Minorites or Franciscans, first settled in Cornhill, and in 1229 John Ewain made over to them an estate situated in the ward of Farrington Within and in the parish of St Nicholas in the Shambles, where their friary was built. Christ Church, Newcastle, now occupies the site of the church of the Greyfriars.

Austin Friars.—The house of the Austin Friars or Friars Eremites was founded in Broad Street Ward in 1251.

Whitefriars.—The Friars of the Blessed Virgin of Mount Carmel or Carmelites or Whitefriars came to London in 1241, and made their home on land between Fleet Street and the Thames given by Edward I.

Besides the four chief orders of friars there were the Crutched Friars in the parish of St Olave, Hart Street (about 1298), and the Friers of the Sac first outside Aldersgate (about 1257) and afterwards in the Old Jewry.

The names of places in London form valuable records of the habits of different classes of the population. The monasteries and friaries are kept in memory by their names in various parts of London. In the same way the residences of the Jews have been marked. When Edward I. expelled the Jews from England in 1290 the district in which they had lived since William the Conqueror's day came to be called the Old Jewry. On their return after many centuries of exile most of them settled in the neighbourhood of Aldgate and Aldersgate. There is a reminder of them in the names of Jewry Street near the former and of Jewin Street near the latter place. Jewin Street was built on the site of the burying-place of the Jews before the expulsion.

In the middle ages there was a constant succession of pageants, processions and tournaments. The royal processions arranged in connexion with coronations were of great antiquity, but one of the earliest to be described is that of Henry III. in 1236, which was chronicled by Matthew Paris. After the marriage at Canterbury of the king with Eleanor of Provence the royal personages came to London, and were met by the mayor, aldermen and principal citizens to the number of 360, sumptuously appareled in silken robes embroidered, riding upon stately horses. After the death of Henry III. (1272) the country had to wait for their new king, who was then in the Holy Land. Edward I. came to London on the 2nd of August 1274, when he was received with the wildest expressions of joy. The streets were hung with rich cloths of silk arras and tapestry; the aldermen and principal men of the city threw out of their windows handfuls of gold and silver, to signify their gladness at the king's return; and the conduits ran with wine, both white and red.

Dr Jessopp gives a vivid picture of what occurred when King Edward III. entered London in triumph on the 11th of October 1347. He was the foremost man in Europe, and England had reached a height of power and glory such as she had never attained before. Ten years after this, one of the most famous scenes in the streets of London occurred, when Edward the Black Prince brought the French King John and other prisoners after the battle of Poitiers to England. This was a scene unequalled until Henry V. returned from the glorious field of Agincourt in 1415. The mayor and aldermen appalled in orient-grained scarlet, and four hundred commoners in murrey, well mounted, with rich collars and chains, met the King at Blackheath. At the entrance to London Bridge the towers were adorned with banners of the royal arms, and in the front of them was inscribed Civitas Regis Justice.

During the troubles of the 15th century the authorities had seen the necessity of paying more attention to the security of the gates and walls of the city, and when Thomas Nevill, son of William, Lord Fauconberg, made his attack upon London in 1471 he experienced a spirited resistance. He first attempted to land from his ships in the city, but the Thames side from Baynard's Castle to the Tower was so well fortified that he had to seek a quieter and less prepared position. He then set upon the several gates in succession, and was repulsed at all. On the 11th of May he made a desperate attack upon Aldgate, followed by 500 men. He won the bulwarks and some of his followers entered into the city, but the portcullis being let down these were cut off from their own party and were slain by the enemy. The portcullis was drawn up, and the besieged issued forth against the rebels, who were soon forced to flee.

When Richard, duke of Gloucester, laid his plans for seizing the crown, he obtained the countenance of the lord mayor, Sir Edmund Shaw, whose brother Dr Shaw praised Richard at Paul's Cross. Crosby Hall, in Bishopsgate Street, then lately built, was made the lodging of the Protector. There he acted the accessible prince in the eyes of the people, for the last of the Plantagenets was another of the usurpers who found favour in the eyes of the men of London. His day, however, was short, and with the battle of Bosworth ends Plantagenet London.
5. Tudor (1485-1603).—It was during this period that the first maps of London were drawn. No representation of the city earlier than the middle of the 16th century has been discovered, although it seems more than probable that some plans must have been produced at an earlier period. The earliest known view is the drawing of Van den Wyngaerde in the Bodleian Library (dated 1550). Braun and Hogenberg's map was published in 1572-1573, and the so-called Agas's map was probably produced soon afterwards, and was doubtless influenced by the publication of Braun and Hogenberg's excellent engraving; Norden's maps of London and Westminster are dated 1593. Some of these maps were pasted upon walls, and must have been largely destroyed by ordinary wear and tear. It is curious that the only two existing copies of Agas's map therein published in the reign of James I., although apparently they had not been altered from the earlier editions of Elizabeth's reign which have been lost. By the help of these maps we are able to obtain a clear notion of the extent and chief characteristics of Tudor London. Henry VII. did little to connect his name with the history of London, although the erection of the exquisite specimen of florid Gothic at Westminster Abbey has carried his memory down in its popular name of Henry VII.'s chapel. Soon after this king obtained the throne he borrowed the sum of 3000 marks from the city, and moreover founded the excellent precedent of repaying it at the appointed time. The citizens were so pleased at this unexpected occurrence that they willingly lent the king £6000 in 1488, which he required for military preparations against France. In 1497 London was threatened by the rebels favourable to Perkin Warbeck, who encamped on Blackheath on the 17th of June. At first there was a panic among the citizens, but subsequently the city was placed in a proper state of defence, and the king himself encamped in St. George's Fields. On June 22 he entirely routed the rebels; and some time afterwards Perkin Warbeck gave himself up, and was conducted in triumph through London to the Tower.

As the chief feature of Norman London was the foundation of monasteries, and that of Plantagenet London was the establishment of friaries, so Tudor London was specially characterized by the suppression of the whole of these religious houses, and also of the almost numberless religious guilds and brotherhoods. When we remember that more than half of the area of London was occupied by these establishments, and that about a third of the inhabitants were monks, nuns and friars, it is easy to imagine how great must have been the disorganization caused by this root and branch reform. One of the earliest of the religious houses to be suppressed was the hospital of St. Thomas of Acon (or Acoyn) on the Southside of Cheapside, the site of which is now occupied by Mercers' Hall. The larger houses soon followed, and the Black, the White and the Grey Friars, with the Carthusians and many others, were all condemned in November 1538.

Love of show was so marked a characteristic of Henry VIII. that we are not surprised to find him encouraging the citizens in the same expensive taste. On the occasion of his marriage with Catherine of Aragon the city was gorgeously ornamented with rich silks and tapestry, and Goldsmiths' Row (Cheapside) and part of Cornhill were hung with golden brocades. When on the eve of St. John's Day, 1510, the king in the habit of a yeoman of his own guard saw the famous march of the city watch, he was so delighted that on the following St. Peter's Eve he again attended in Cheapside to see the march, but this time he placed himself on the top of the city gate. The cost of the two marches in the year was very considerable, and, having been suspended in 1528 on account of the prevalence of the sweating sickness, they were soon afterwards forbidden by the king, and discontinued during the remainder of his reign. Sir John Gresham, mayor in 1548, revived the march of the city watch, which was made more splendid by the addition of three hundred light horsemen raised by the citizens for the king's service.

The best mode of utilizing the buildings of the suppressed religious houses was a difficult question left unsolved by Henry VIII. That king, shortly before his death, refounded Rahere's St Bartholomew's Hospital, "for the continual relief and help of an hundred sore and diseased," but most of the large buildings were left unoccupied to be filled by his successor. The first parliament of Edward's reign gave all the lands and possessions of colleges, chantries, &c., to the king, when the different companies of London redeemed those which they had held for the payment of priests' wages, obits and lights at the price of £30,000, and applied the rents arising from them to charitable purposes.

In 1550 the citizens purchased the manor of Southwark, and with it they became possessed of the monastery of St Thomas, which was enlarged and prepared for the reception of "poor, sick and helpless objects." Thus was refounded St Thomas's Hospital, which was moved to Lambeth in 1870-1871. Shortly before his death Edward founded Christ's Hospital in the Grey Friars, and gave the old palace of Bridewell to the city "for the lodging of poor wayfarers, the correction of vagabonds and disorderly persons, and for finding them work." On the death of Edward VI. Lady Jane Grey was received at the Tower as queen, she having gone there by water from Durham House in the Strand. The citizens, however, soon found out their mistake, and the lord mayor, aldermen and recorder proclaimed Queen Mary at Cheapside. London was then gay with pageants, but when the queen made known her intention of marrying Philip of Spain the discontent of the country found vent in the rising of Sir Thomas Wyatt, and the city had to prepare itself against attack. Wyat took possession of Southwark, and expected to have been admitted into London; but finding the gates shut against him and the drawbridge cut down he marched to Kingston, the bridge at which place had been destroyed. This he restored, and then proceeded towards London. In consequence of the breakdown of some of his guns he imprudently halted at Turnham Green. Had he not done so it is probable that he might have obtained possession of the city. He planted his ordnance on Hay Hill, and then marched by St. James's Palace to Charing Cross. Here he was attacked by Sir John Gage with a thousand men, but he repulsed them and reached Ludgate without further opposition. He was disappointed at the resistance which was made, and after musing a while "upon a stall over against the Bell Savage Gate" he turned back. His retreat was cut off, and he surrendered to Sir Maurice Berkeley. We have somewhat fully described this historical incident here because it has an important bearing on the history of London, and shows also the small importance of the districts outside the walls at that period.

We now come to consider the appearance of London during the reign of the last of the Tudors. At no other period were so many great men associated with its history; the latter years of Elizabeth's reign are specially interesting to us because it was then that Shakespeare lived in London, and introduced its streets and people into his plays. In those days the frequent visitation of plagues made men fear the gathering together of multitudes. This dread of pestilence, united with a puritanic hatred of plays, made the citizens do all they could to discountenance theatrical performances. This hatred was known as the first reason, but she disregarded the religious objection, provided ordinary care was taken to allow "such plays only as were fitted to yield honest recreation and no example of evil." On April 11, 1582, the lords of the council wrote to the lord mayor to the effect that, "as her Majesty sometimes took delight in those pastimes, it had been thought not unfit, having regard to the season of the year and the clearance of the city from infection, to allow of certain companies of players in London, partly that they might thereby
attain more dexterity and perfection the better to content her Majesty" (Analytical Index to the Remembrancia). When theatres were established the London map took care that they should not be built within the city. The "Theatre" and the "Curtain" were situated at Shoreditch; the "Globe," the "Swan," the "Rose" and the "Hope" on the Bankside; and the Blackfriars theatre, although within the walls, was without the city jurisdiction.

In 1561 St Paul's steeple and roof were destroyed by lightning, and the spire was never replaced. This circumstance allows us to test the date of certain views; thus Wyngaerde's map has the spire, but Agas's map is without it. In 1566 the first stone was laid of the "Burse," which owed its origin to Sir Thomas Gresham. In 1571 Queen Elizabeth changed its name to the Royal Exchange. The Strand was filled with noble mansions washed by the waters of the Thames, but the street, if it could be called, was little used by pedestrians. Londoners frequented the river, which was their great highway. The banks were crowded with stairs for boats, and the watermen of that day answered to the chairman of a later date and the cabmen of to-day. The Bankside was of old a favourite place for entertainments, but two only—the bull-baiting and the bear-baiting—were in existence when Agas's map was first printed. The former was a promenade in the gardens of Paris Garden, the bearhouse and the playhouse.

The settled character of the later years of Elizabeth's reign appears to have caused a considerable change in the habits of the people. Many of the chief citizens followed the example of the courtiers, and built them houses in Middlesex, Essex and Surrey; thus we learn from Norden that Alderman Roe lived at Muswell Hill, and we know that Sir Thomas Gresham built a fine house and planned a beautiful park at Osterley. The maps show us much that remains somewhat the same as it was, but also much that has greatly altered. Sir Giles's was literally a village in the fields; Piccadilly was "the way to Redrige," Oxford Street "the way to Uxbridge." Covent Garden an open field or garden, and Leicester Fields lammas land. Moorfields were drained and laid out in walks in Elizabeth's reign. At Spitalfields crowds used to congregate on Easter Monday and Tuesday to hear the Spital sermons preached from the pulpit cross. The ground was originally a Roman Cemetery, and about the year 1576 bricks were largely made from the clayey earth. The collection of which is kept alive in the name of Brick Lane. Citizens went to Holborn and Bloomsbury for change of air, and houses were there prepared for the reception of children, invalids and convalescents. In the north were the outskirts of Islington, Hoxton and Clerkenwell.

6. Stuart (1603-1714).—The Stuart period, from the accession of James I. to the death of Queen Anne, extends over a little more than one period, and may be considered curiously enough to be the same as that during which we have hitherto been considering. The early years of Stuart London may be said to be closely linked with the last years of Elizabethan London, for the greatest men, such as Raleigh, Shakespeare and Ben Jonson, lived on into James's reign. Much of the life of the time was then in the City, but the last years of Stuart London take us to the 18th century, when social life had permanently shifted to the west end. In the middle of the period the whole character of the city, and then the fire which changed the whole aspect of London. When James came to the throne the term suburbs had a bad name, as all those disrespectful persons who could find no shelter in the city itself settled in these outlying districts. Stubbs denounced suburban gardens and garden houses in his Anatomy of Abuses, and another writer observed "how happy were cities if they had no suburbs."

The preparations for the coronation of King James were interrupted by a severe visitation of the plague, which killed off as many as 30,578 persons, and it was not till March 15, 1604, that the king, the queen and Prince Henry passed triumphantly through the gates of Westminster. The Lord mayor's show, which had been discontinued for some years, was restored by order of the king in 1609. The dissolved monastery of the Charterhouse, which had been bought and sold by the courtiers several times, was obtained from Thomas, earl of Suffolk, by Thomas Sutton for £13,000. The new hospital chapel and

schoolhouse were begun in 1611, and in the same year Sutton died.

With the death of James I. in 1625 the older history of London may be said to have closed. During the reign of his successor the great change in the relative position of London was within and without the walls had set in. Before going on to consider the chief incidents of this change it will be well to refer to some features of the social life of James's reign. Ben Jonson places one of the scenes of Every Man in his Humour in Moorfields, which at the time he wrote the play he had, as stated above, lately been drained and laid out in walks. Beggars frequented the place, and travellers from the village of Hoxton, who crossed it in order to get into London, did so with as much expedition as possible. Adjoining Moorfields were Finsbury Fields, a favourite practising ground for the archers. Mile End, a common on the Great Eastern Road, was long famous as a rendezvous for the troops. These places are frequently referred to by the old dramatists; Justice Shallow boasts of his doings at Mile End Green when he was Dagonet in Arthur's Show. Fleet Street was the show-place of London, in which were exhibited a constant succession of puppets, naked Indians and strange fishes. The great meeting-place of Londoners in the day-time was the nade of old St Paul's. Crowds of painters and cabinet-makers, with their hats on transacted business in the aisles, and used the font as "their greatest - capital place." Lawyers received clients at their several pillory, and the serving-men waited to be engaged upon their own particular bench. Besides those who came on business there were gallants dressed in fashionable finery, so that it was worth the tailor's while to stand behind a pillar and fill his table-books with notes.

The middle or Mediterranean aisle was the Paul's Walk, also called the Duke's Gallery from the erroneous supposition that the tomb of Sir Guy Beauchamp, earl of Warwick, was that of "the good" Humphrey, duke of Gloucester. After the Restoration a fence was erected on the inside of the great north door to hinder a concourse of rude people, and when the cathedral was being rebuilt Sir Christopher Wren made a strict order against any profanation of the sacred building. St Paul's churchyard was from the earliest days of printing until the end of the 18th century the headquarters of the book trade, when it shifted to Paternoster Row. Another of the favourite haunts of the people was the garden of Gray's Inn, where the choicest society was to be met. There, under the shadow of the elm trees which Bacon had planted, Pepys and his wife constantly walked. Mrs Pepys went on one occasion specially dressed up, in the fashions of the ladies because she was then "making some clothes."

In those days of public conviviality, and for many years afterwards, the taverns of London held a very important place. The Boar's Head in Great Eastcheap was an inn of Shakespeare's own day, and the characters he introduces into his plays are really his own contemporaries. The "Mermaid" is sometimes described as in Bread Street, and at other times in Friday Street and also in Cheapside. We are thus able to fix its exact position; for a little to the west of Bow church is Bread Street, then came a block of houses, and the next thoroughfare was Friday Street. It was in this block that the "Mermaid" was situated, and there appear to have been entrances from each street. What makes this fact still more certain is the circumstance that a haberdasher in Cheapside living "twixt Wood Street and Milk Street," two streets on the north side opposite Bread and Friday Streets, described himself as "over against the Mermaid tavern in Cheapside." The Windmill was then occupied as a public shop and in the action of Every Man in his Humour. The Windmill was the corner of the Old Jewry towards Lothbury, and the Mitre close by the Mermaid in Bread Street. The Mitre in Fleet Street, so intimately associated with Dr Johnson, also existed at this time. It is mentioned in a comedy entitled Ram Alley (1611) and Lilly the
astrologer frequented it in 1640. At the Mermaid Ben Jonson had such companions as Shakespeare, Raleigh, Beaumont, Fletcher, Carew, Donne, Cotton and Selden, but at the Devil in Fleet Street, where he started the Apollo Club, he was omnipotent. Herrick, in his well-known Ode to Ben, mentions several of the inns of the day.

Under James I. the theatre, which established itself so firmly in the latter years of Elizabeth, had still further increased its influence, and to the entertainments given at the many playhouses may be added the masques so expensively produced at court and by the lawyers at the inns of court. In 1613 The Masque of Flowers was presented by the members of Gray’s Inn in the Old Banqueting House in honour of the marriage of the infamous Carr, earl of Somerset, and the equally infamous Lady Frances, daughter of the earl of Suffolk. The entertainment was prepared by Sir Francis Bacon at a cost of about £2000. It was during the reign of Charles I. that the first great exodus of the wealthy and fashionable was made to the West End. The great square or piazza of Covent Garden was formed from the designs of Inigo Jones about 1632. The neighbouring streets were built shortly afterwards, and the names of Henrietta, Charles, James, King and York Streets were given after members of the royal family. Great Queen Street, Lincoln’s Inn Fields, was built about 1629, and named in honour of Henrietta Maria. Lincoln’s Inn Fields had been planned some years before. With the Restoration the separation of fashionable from city life became complete.

When the Civil War broke out London took the side of the parliament, and an extensive system of fortification was at once projected to protect the town against the threatened attack of the royal army. A strong earthen rampart, flanked with bastions and redoupts, surrounded the City, its liberties, Westminster and Southwark, making an immense enclosure.

London had been ravaged by plague on many former occasions, but the pestilence that began in December 1664 lives in history as “the Plague of London.” On the 7th of June 1665 Samuel Pepys for the first time saw two or three houses marked with the red cross and the words “Lord, have mercy upon us,” on the doors. The deaths daily increased, and business was stopped. Grass grew in the area of the Royal Exchange, at Whitehall, and in the principal streets of the city. On the 4th of September 1665 Pepys writes an interesting letter to Lady Carteret from Woolwich: “I have stayed in the city till above 7400 died in one week, and of them about 6000 of the plague, and little noise heard day or night but tolling of bells.” The plague was scarcely stayed before the winter came, and in the cold, a calamity of the first magnitude, but one which in the end caused much good, as the seeds of disease were destroyed, and London has never since been visited by such an epidemic. On the 2nd of September 1666 the fire broke out at one o’clock in the morning at a house in Pudding Lane. A violent east wind fomented the flames, which raged during the whole of Monday and great part of Tuesday. On Tuesday night the wind fell somewhat, and on Wednesday the fire slackened. On Thursday it was extinguished, but on the evening of that day the flames again burst forth at the Temple. Some houses were at once blown up by gunpowder, and thus the fire was finally mastered. Many interesting details of the fire are given in Pepys’s Diary. The river swarmed with vessels filled with persons carrying away such of their goods as they were able to save. Some fled to the hilly districts of Hampstead and Highgate, but Moorfields was the chief resort of the houseless Londoners. Soon paved streets and two-storey houses were seen in that swampy place. The people bore their troubles heroically, and Henry Oldenburg, writing to the Hon. Robert Boyle on September 15, says: “The citizens, instead of complaining, discoursed almost of nothing but of a survey for rebuilding the city with bricks and large streets.”

Within a few days of the fire three several plans were presented to the king for the rebuilding of the city, by Christopher Wren, John Evelyn and Robert Hooke. Wren proposed to build main thoroughfares north and south, and east and west, to insulate all the churches in conspicuous positions, to form the most public places into large piazzas, to unite the halls of the twelve chief companies into one regular square annexed to Guildhall and to make a fine quay on the bank of the river from Blackfriars to the Tower. His streets were to be of three magnitudes—90 ft., 60 ft. and 30 ft. wide respectively. Evelyn’s plan differed from Wren’s chiefly in proposing a street from the church of St Dunstan’s in the East to the cathedral, and in having no quay or terrace along the river. In spite of the best advice, however, the jealousies of the citizens prevented any systematic design from being carried out, and in consequence the old lines were in almost every case retained. But though the plans of Wren and Hooke were not adopted, it was to these two fellows of the Royal Society that the labour of rebuilding London was committed. Wren’s great work was the erection of the cathedral of St Paul’s, and the many churches ranged round it as satellites. Hooke’s task was the humbler one of arranging as city surveyor, for the building of the houses. He laid out the ground of the several proprietors in the rebuilding of the city, and had no rest early or late from persons soliciting him to set out their ground for them at once. The first great impetus of change in the configuration of London was given by the great fire, and Evelyn records and regrets that the town in his time had grown almost as large again as it was within his own memory. Although for several centuries attempts had been made in favour of building houses with brick or stone, yet the carpenters continued to be the chief house-builders. As late as the year 1650 the Carpenters’ Company drew up a memorial in which they “gave their reasons that timber buildings were more commodious for this city than brick buildings were.” The Act of Parliament “for rebuilding the city of London” passed after the great fire, gave the coup de grace to the carpenters as house-builders. After setting forth that “building with brick was not only more comely and durable, but also more safe against future perils of fire,” it was enacted “that all the outsides of all buildings in and about the city should be made of brick or stone, except doorcases and window-frames, and other parts of the first story to the front between the piers,” for which substantial oak timber might be used “for conveniency of shops.” In the winter of 1663—1664 a fair was held for some time upon the Thames. The frost, which began about seven weeks before Christmas and continued for six weeks after, was the greatest on record; the ice was 11 in. thick.

The revocation of the edict of Nantes in October 1685, and the consequent migration of a large number of industrious French Protestants, caused a considerable growth in the east end of London. The silk manufactories at Spitalfields were then established.

During the short reign of James II. the fortunes of the city were at their lowest, and nowhere was the arrival of the prince of Orange more welcomed. William III. cared little for London, the smoke of which gave him asthma, and when a great part of Whitehall was burnt in 1691 he purchased Nottingham House and made it into Kennington Palace. Kensington was then an insignificant village, but the arrival of the court soon caused it to grow in importance.

Although the spiritual wants of the city were amply provided for by the churches built by Wren, the large districts outside the city and its liberties had been greatly neglected. The act passed in the reign of Queen Anne for building fifty new churches (1710) for a time supplied the wants of large districts.

HISTORY] LONDON 963
constantly to be seen in the capital have been reproduced by Hogarth, and had they not been set down by so truthful an observer it would have been almost impossible to believe that such enormities could have been committed in the streets of a great city. A few days after his accession George I. addressed the representatives of the city in these words: “I have lately been made sensible of what consequence the city of London is, and therefore shall be sure to take all their privileges and interests into my particular protection.” On the following lord mayor’s day the king witnessed the show in Cheapside and attended the banquet at Guildhall. Queen Anne and the first three Georges were all accommodated, on the occasions of their visits to the city to see the show, at the same house opposite Bow church. In the time of Queen Anne and George I. David Barclay (the son of the famous apostle for the Quakers) was an apprentice in the house, but he subsequently became master, and had the honour of receiving George II. and George III. as his guests. There was a large balcony extending along the front of the house which was fitted with a canopy and hangings of crimson damask silk. The building, then numbered 108 Cheapside, was pulled down in 1861.

Early in the 18th century there was a considerable extension of building operations in the West End. Still, however, the north of London remained unbuilt upon. In 1756 and for some years subsequently the land behind Montague House (now the British Museum) was occupied as a farm, and when in that year a proposal was made to plan out a new road the tenant and the duke of Bedford strongly opposed it. In 1772 all beyond Portland Chapel in Great Portland Street was owned by Bed ford House in Bloomsbury Square had its full view of Hampstead and Highgate from the back, and Queen’s Square was built open to the north in order that the inhabitants might obtain the same prospect. In 1737 the Fleet ditch between Holborn Bridge and Fleet Bridge was covered over, and Stock Market was removed from the site of the Mansion House to the present Farringdon Street, and opened to Fleet market. On October 25, 1739, the first stone of the Mansion House was laid. Previously the first magistrates lived in several different houses. A frost almost as severe as the memorable one of 1683–1684 occurred in the winter of 1739–1740, and the Thames was again the scene of a frost fair. In 1758 the houses on London Bridge were cleared away, and in 1760–1762 several of the city gates were taken down and sold. Moorgate is said to have fetched £166, Aldersgate £91, Aldgate £177, Cripplegate £96, and Ludgate £148. The statue of Queen Elizabeth was sold to the Movers of London for £400, which was purchased by Alderman Gosling and set up against the east end of St Dunstan’s church in Fleet Street, where it still remains.

8. Nineteenth Century.—In 1860 London saw the public funerals of three of England’s greatest men. On the 8th February the body of Nelson was borne with great pomp from the Admiralty to St Paul’s Cathedral, where it was interred in the presence of the prince of Wales and the royal dukes. Pitt was buried on the 22nd of February, and Fox on the 19th of October, both in Westminster Abbey.

The first exhibition of Winson’s system of lighting the streets with gas took place on the king’s birthday (June 4) 1857, and was made in a row of lamps in front of the colonnade before Carlton House. Finsbury Square was the first public place in which gas lighting was actually adopted, and Grosvenor Square, the last. In the winter of 1813–1814 the Thames was again frozen over. The frost began on the evening of December 27, 1813, with a thick fog. After it had lasted for a month, a thaw of four days, from the 26th to the 29th of January, took place, but this thaw was succeeded by a renewal of the frost, so severe that the river soon became one immovable sheet of ice. There was a street of tents called the City Road, which was daily thronged with visitors. In 1838 the second Royal Exchange was destroyed by fire; and on October 28, 1844, the Queen opened the new Royal Exchange, built by Mr (afterwards Sir William) Tite. The Great Exhibition of 1851 brought a larger number of visitors to London than had ever been in it before at one time. The great and continuous increase in the buildings and the enlargement of London on all sides dates from this period.

London within the walls has been almost entirely rebuilt, although in the neighbourhood of the Tower there are still many old houses which have only been refounded. From the upper rooms of the houses may be seen a large number of old tiled roofs.

Unlike many capitals of Europe which have shifted their centres the city of London in spite of all changes and the continued enlargement of the capital remains the centre and head-quarters of the business of the country. The Bank of England, the Royal Exchange and the Mansion House are on the site of Ancient London.

In 1863 on the occasion of the marriage of King Edward VII. (when Prince of Wales) the streets of London were illuminated as they had never been before. Among other events which made the streets gay and centred in processions to St Paul’s may be specially mentioned the Thanksgiving Day on the 27th of February 1872 for the recovery of the prince of Wales after his dangerous illness; and the rejoicings at the Jubilee of Queen Victoria in 1887, and the Diamond Jubilee in 1897.

The first great emigration of the London merchants westward was about the middle of the 18th century, but only those who had already secured large fortunes ventured so far as Hatton Garden. At the beginning of the 19th century it had become common for the tradesmen of the city to live away from their businesses, but it was only about the middle of the 19th century that it became at all usual for those in the West End to do the same.

During the first half of the 19th century the position of the City Corporation had somewhat fallen in public esteem, and some of the most influential men in the city were unconnected with it, but a considerable change took place in the latter half of the century. Violent attacks were made upon the Livery Companies, but of late years, largely owing to the public spirit of the companies in devoting large sums of money towards the improvement of the several industries in connexion with which they were founded, and the establishment of the City and Guilds of London Technical Institute, a complete change has taken place as to the public estimation in which they are held.

Growth and Population

Much has been written upon the population of medieval London, but little certainty has resulted therefrom. We know the size of London at different periods and are able to guess to some extent as to the number of its inhabitants, but much more ignorance reigns as to the numbers which have come down to us in our houses. The results of the poll-tax have often been considered as trustworthy substitutes for population returns, but Professor Oman has shown that little trust can be placed in these results. As an instance he gives the result of the poll-tax of 1381, which he considers so unreliable that the commissioners of the poll-tax reported that there were only two-thirds as many contributaries in 1381 as in 1377. The adult population of the realm had ostensibly fallen from 1,355,201 to 896,481. These figures were regarded with incredulity.

The Bills of Mortality of the 16th and 17th centuries are of more value, and they have been considered and revised by such able statisticians as John Graunt and Sir William Petty. It was not, however, before the 19th century that accurate figures were obtained. The circuit of the walls of London which were left by the Romans was never afterwards enlarged, and the population did not overflow into the suburbs to any extent until the Tudor period. Population was practically stationary for centuries owing to pestilences and the large proportion of deaths among infants. We have no materials to judge of the number of inhabitants before the Norman Conquest, but we can guess that there were many open spaces within the walls that were afterwards filled up. It is scarcely worth while to guess as to the number of Saxon London, but it is possible that in the early period there were about 10,000 inhabitants, growing later to about 20,000. During the latter part of the Saxon period the numbers of the population of the city became very uncertain, however, as the gates were refounded by the Norman Conquest. The population increased during the next ten peaceful years of Henry III., and increased slowly until the death of Edward II., and then it began to fall off, and continued to decrease during the period of the Wars of the Roses and of the Wars of the Roses and of the Barons until the accession of the first Tudor monarch.

1 The Great Revolt of 1381 (Oxford, 1906), p. 27.
The same causes that operated to bring about these changes in the whole kingdom were of course also at work in the case of the City of London.

One of the earliest statements as to the population of London occurs in a letter written in 1209 by the bishop of London to the pope, Peter of Blois, then archdeacon of London, and therefore a man of some authority on the subject. He states that the City contained 120 parish churches and 40,000 inhabitants. These numbers have been generally accepted as fairly correct, and Dr. Creighton comes to the conclusion that the population of London from the reign of Richard I. to that of Henry VII. varied within a limit of about forty to fifty thousand inhabitants.

Dr. Creighton points out that the number given by certain chroniclers is often above the truth. The population of London is incredible; such for instance as the statement that forty or fifty thousand bodies were buried in Charterhouse churchyard at the time of the Black Death in 1348-1349. Although there have been taken as a basis for calculating the population of London from the reign of the earlies Henry VII., there is much evidence to show that on the average the amount of forty to fifty thousand fixed by Dr. Creighton for the years between 1189 and 1500 is fairly correct. The population was fixed at the time of the Tudor accession by the size of the City, and from that time the population of London continued to increase, in spite of attempts by the government to prevent it. One of the first periods of increase was after the dissolution of the religious houses. The next was during the Restoration.

A proclamation was issued in 1578 prohibiting the erection within 3 m. of the city gates of any new houses or tenements “where no former house hath been known to have been.” In a subsequent proclamation Queen Elizabeth commanded that only one new house, that empty houses erected within seven years were not to be let and that unfinished buildings on new foundations were to be pulled down. In spite of these restrictions London continued to grow. James I. and Charles I. were filled with the wonder of the increasing growth of London. In 1630 a similar proclamation to that of 1580 was published. During the greater part of the 18th century there was a serious check to the increase of population, but at the end of the century a considerable increase occurred, and in the middle of the 19th century that enormous and rapid increase became particularly marked. To return to the 16th century when the Bills of Mortality came into existence. Mention is made of these bills as early as 1577, but the earliest series now known began on 15 March 1583 and continued till 1628. The manuscript returns of burials and christenings for five years from 1578 to 1582 preserved in the library at Hatfield House. The history of the Bills of Mortality which in the earlier period have been instrumental in the publication of so much interesting data, and Dr. Creighton has stated it with great clearness. The Company of Parish Clerks is named in an ordinance of 1583 (of which there is a copy in the Record Office) as the body responsible for the bills, and there is no reason to believe that the City authorities were not responsible.

London Mortality. Sir William Petty followed with his important inquiries upon the population (Essay on Political Arithmetic, 1663).

It is not worth while to refer to all the wild guesses that were made by various writers, but Dr. Creighton shows the absurdity of one of them. The chronicler Somers had informed the king’s ambassador for the information of the doge and senators of Venice. He estimates the population to have been 180,000 persons, which Dr. Creighton affirms to be nearly three times the number that we have obtained by the moderate calculation from the bills of mortality in 1533 and 1535.

Following on his calculations from 1509, when the population may be supposed to have been about 50,000, Dr. Creighton carriers on his numbers to the Restoration in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>1533-1535</td>
<td>62,400</td>
</tr>
<tr>
<td>1553</td>
<td>93,276</td>
</tr>
<tr>
<td>1580</td>
<td>123,004</td>
</tr>
<tr>
<td>1593-1595</td>
<td>152,475</td>
</tr>
</tbody>
</table>

The numbers for 1661 are those arrived at by Graunt, and they are just about half the population given authoritatively in the first census 1864-845. It therefore took 140 years to double the numbers, while in 1841 the numbers of 1801 were more than doubled. These numbers were arrived at with much care and may be considered as fairly accurate although some other calculations conflict with a few of the figures. The first attempt to a census was in August 1631 when the lord mayor returned the number of mouths in the city of London and Liberties at 130,268, which was somewhat about half the number of the 1661 above.

The totals returned for the last census are contained in the bills of mortality compared with that containing only the city and its liberties. However, the suggestion that the population of London in 1631 was a million and a half need only be mentioned as an item of the wide impression of Graunt’s numbers.

Graunt’s numbers for 1682 are 670,000 and those of Gregory King for 1696, 530,000. The latter are corroborated by those of 1700, which are given as 550,000. Mainland gives the numbers 1700-1710, which were 725,993. The decrease of the 18th century.

It is not necessary to give any further numbers for the population of the 18th century, as that has been already stated to have been almost stationary. This is proved by Gregory King’s figures for 1700-1720, when compared with those of the first census for 1681 (864,035). A corroboration is also to be found in the report of the first census for 1801, where a calculation is made of the probable population of the years 1700 and 1750. These are given respectively as 915,764 and 976,250. The 21st January 1801 was fixed as the day of London within (and) without the walls, (3) the City and Liberties of Westminster, the (4) the outparishes within the bills of mortality and (5) the parishes not within the bills of mortality. No. 5 is given as 915 in 1801, and 1350 in 1750. The difference in the population in the 18th century is considerable reduction in the numbers of the city of London is supposed to have taken place, as is seen in the following figures:

<table>
<thead>
<tr>
<th>Year</th>
<th>Within Walls</th>
<th>Outside Walls</th>
</tr>
</thead>
<tbody>
<tr>
<td>1700</td>
<td>139,300</td>
<td>87,000</td>
</tr>
<tr>
<td>1750</td>
<td>69,000</td>
<td>57,300</td>
</tr>
</tbody>
</table>

As the increase in Westminster is not great (130,000 in 1700 and 152,000 in 1750) and there is little difference in the totals it will be seen that the amount is chiefly made up by the increase in the parishes without the bills of mortality. The extraordinary growth of London did not come into existence until about the middle of the 19th century (see § IV. above).

**GOVERNMENT**

We know little of the government of London during the Saxon period, and it is only incidentally that we learn how the Londoners had become possessed of special privileges which he continued to claim with the desire to exclude others. One of the chief of these was the claim to a separate voice in the election of the king. The citizens did not dispute the right of election by the kingdom but they held that that election did not necessarily include the choice of London.

An instance of this is seen in the election of Edmund Ironside, although the Witan outside London had elected Canute. The remarkable instance of this after the Conquest was the election of William the Conqueror. But William had that advantage which the Londoners had not until the sanction of the Londoners to his king’ship, and his attitude towards London when he hovered about the neighbourhood of the city for a time shows that he was anxious to obtain this sanction freely rather than by compulsion. His hopes and expectations were fulfilled when

1 In a valuable paper on “The Population of Old London” in Blackwood’s Magazine for April 1883.

2 The old Bills of Mortality, although of value from being the only authority on the subject, were never complete owing to various causes: one being that large numbers of Roman Catholics and Dissenters were not registered in the returns, and that bishops and archbishops, who did not keep the records, were told by the action of the Registration Act for England and Wales, which came into operation July 1st, 1837.

3 The Weekly Returns of the Registrar-General began in 1840.

4 The invention of bills of mortality is not so modern as has been generally supposed. In the 17th century, registers of deaths in London were kept, the service of a registrar was the service of a registrar office.”—Journal Statistical Society, xvii. 115 (1854).
the gates of London were opened to receive him, as already related. 

Athelstan's acceptance of the London-made law for the whole kingdom, as pointed out by Mr. Gomme, is another instance of the independence of the Londoners. When William the Conqueror granted the charter of 1089, he had conquered London and the port of London—both the bishop as the ecclesiastical governor and the portreeve as the representative of the civil power.

The word "portreefe" in the title of the office signifies"port" and "reefe", the natural equivalent of "portreeve", as supposed, for Stubbs has pointed out that it is "porta not portus", and "although used for the city generally, seems to refer to it specially in its character of a port or City of Merchants. The Saxon title of reeve was continued during the reigns of Henry I and Richard I, to be restored by John in 1196. The Londoners had a figure as a mayor forever, and until the end of the 12th century, the office was filled by a popular or representative body. In 1196, John granted the privilege of appointing a mayor to London, and this office has been in continuous existence ever since.

In the 12th century there was a great municipal movement over Europe. Londoners were well informed as to what was going on abroad, and although the rulers were always willing to wait for an opportunity to secure their own advantage, it seems that John was able to point out some advantage of such circumstances as might occur. Their opportunity occurred while Richard I was engaged abroad as a crusader. In 1196 a deed was struck to commemorate the 700th anniversary of the London Borough, and this deed, as well as the grant of the office, was made in 1189. With respect to this tradition,Round writes (Commune of London, p. 223): "The assumption that the mayoralty of London dates from the accession of Richard I, is an absolute perversion of history," and he adds that "there is record evidence which completely confirms the remarkable words of Richard de Devizes, who declares that on no terms whatever would King Richard or his father have ever assented to the establishment of the Commune in London in 1189."

In October 1191 the conflict between John the king's brother and Longchamp, the king's representative, became acute. The latter bitterly opposed the Londoners, who, finding that they could not maintain their position, offered John the office of mayor for the price of their support. A small party of the citizens under Henry of Cornhill remained loyal to the chancellor Longchamp, but at a meeting held at St. Paul's on the 8th of October, the barons welcomed the archbishop of Rouen as chief justice (he having produced the king's sign manual appointing a new commission), and they saluted John as regent. Stubbs, in his introduction to the Chronicle of Roger de Hoveden, writes: "This done, oaths were sworn to John the king and Richard the chancellor, to maintain the Commune of London; the oath of fealty to Richard was then sworn. John taking it first, then the two archbishops, the bishops, the barons, and last the burgheers with the express understanding that the king should confine his residence to Rouen and appoint John as his successor. Referring to this important event, Mr. Round writes: "The excited citizens, who had poured out overnight, with lanterns and torches, to welcome John to the capital, streamed together at the morning of the eventful 8th of October at the well-known sound of the great bell swinging out from its campanile in St. Paul's Churchyard. There they heard John take the oath to the Commune like a French king or lord; and then London for the first time had a municipality of her own."

Little is known as to what the Commune then established really was. Round's remarkable discovery among the manuscripts of the British Museum shows that the British Museum of the Oath of the Commune proclaims for the first time that the Londoners had developed "commune" of the continental pattern. A striking point in this municipal revolution is the new privileges extended to the city of London were entirely copied from those of the French towns, and their growth of the same kind of administrative machinery. Hence, the present-day London is the offspring of that of Rouen. This MS gives us information which was unknown before, but perhaps the opinions as to the early growth of the position of the aldermen. From this we learn that the government of the city was in the hands of a mayor and twelve aldermen (skewini); both these names being French, seem to have been retained by the aldermen. The latter (1205-1206), Round holds that the Court of Sessions and the aldermen, of which at present we know nothing further than what is contained in the terms of the oaths, was the germ of the Common Council. We must not suppose that when the city of London obtained the privilege of appointing a mayor, and a common could boast in 1194 that "come what may the Londoners shall have no king but their mayor," that the king did not occasion the claim in suspending the liberties of the city. There were really constant disagreements, and sometimes the king degraded the mayor and appointed a custos or warden in his place. Several instances might be given of the fact that the king retained the right to appoint a mayor whenever he chose. We must bear in mind that the mayors of London besides holding a very onerous position were mostly men of great distinction. They often held rank outside the city, and naturally took their place among the representatives of the landed interests as well as merchant princes.

There is no definite information as to when the aldermen became the official advisers of the mayor. The various wards were each represented by a number of the aldermen, and we cannot fix the time when they were united as a court of aldermen. Stubbs writes: "The governing body of London in the 13th century was composed of the mayor, twenty-five aldermen of the wards and two sheriffs."

As we do not find any further evidence than the oath of the Commune-alluded to of the existence of "ecchevins" in London, it is possible that aldermen were elected on the mayor's council under the same title in 1189, if not before. Although this is stated, is inclined to believe that the body of ecchevins became in course of time the Court of Common Council. The aldermen are not mentioned as the colleagues of the mayor until the very end of the 13th century, when the office of alderman was created for the first time in 1298-1299. The aldermen were not again mentioned until the 14th century, until 1315, when the office was granted to the seven wards, and this, of course, related specially to the duties of aldermen as heads of the wards of the city.

In March 1296-1299 letters were sent from the "Mayor and Common Council of the City of London" to the municipalities of Bruges, Calais, and Cambrai. Although the official form of "The Mayor and Commune" was continued until the end of the 13th century, and it was not until early in the 14th century that the form "Mayor, Common Council of the City of London" began to prevail, there is insufficient evidence to show that the aldermen and common council before that time were acting as mayors and common council of the city. In 1377 it is ordered that aldermen could be elected annually, but they were not to be re-elected for his ward at the expiration of his year of office without any interval.

In 1394 the Ordinance regulating annual elections was repealed by the king (Richard II). Distinct rank was accorded to aldermen, and in Liber Albus we are told that "it is a matter of experience that ever since the year of our Lord 1350, at the seputation of aldermen, the ancient custom of interment with baronial honours was observed; and those who had been mayor were assessed as an earl and the aldermen as barons."

The government of the city by reeves dates back to a very early period, and these reeves were appointed by the king. The prefix of "the" signifies that the title was a personal one, and that the reeves were selected to make up the office of sheriff, although the office of the sheriff is distinct from the office of mayor.

After the establishment of the Commune and the appointment of a mayor the sheriffs naturally lost much of their importance, and they became, what the Americans called "sheriffs" of the towns. When Middlesex was in farm to London, the two sheriffs were equally sheriffs of London and Middlesex. There is only one instance in the city records of a sheriff of Middlesex being mentioned as distinct from the other. This was in 1298 when Anketin de Bethune was appointed sheriff of London and Walter de Besançons was appointed sheriff of Middlesex.

By the Local Government Act of 1888, the citizens of London were deprived of all right of jurisdiction over the county of Middlesex, which had been expressly granted by various charters and written wills. In 1383 it was ordained and agreed "that no person shall from henceforth be mayor in the said city if he have not first been sheriff of the said city, to the end that he may be tried in governance and not have any control over the sheriff."

The two courts—that of aldermen and that of the common council—were probably formed at the same time, but it is remarkable that we have no definite information as to the number of members of the common council. The number of members of the common council varied greatly at different times, but the right to determine the number was indirectly granted by the charter of Edward III. (1341) which empowers the city to amend customs and usages which have become burdensome.

There have also been many changes in the mode of election. The common council were chosen by the wards until 1376, when the appointments were made by certain companies. In 1376 an ordinance was made by the mayor and aldermen, with the consent of the whole commons, to the effect that the companies should select men
with whom they were content, and none other should come to the elections of mayors and sheriffs; that the greater companies should not elect more than six, the lesser four and the least two. Forty-seven companies nominated 156 members. In 1935, the right of election was transferred to the wards, but was obtained again by the livery companies in 1467.

The Common Hall was the successor of the folkmote, the meetings of which were originally held in the open air at the east end of St Paul's. The jurisdiction of the General Assemblies of the citizens was described in the city records as immensa communitatis or immensa multitudine civium. The elections in Common Hall were by the whole body of citizens and in 1835 the right was transferred to the Court of Common Hall by the mayor. In 1464, the reign the elections of mayor, sheriffs and other officers and members of parliament were transferred to the livery. Various alterations were subsequently made to the system of election of the general officers of the city by the livery. The right to elect the mayor was transferred to the Court of Common Hall by the mayor in 1464. The elections of mayor and other officers and members of parliament were then continued by the mayor, the Common Hall, the Court of Common Hall and the Court of Conduit Ward.

The common serjeant was formerly appointed by the city, but since 1897 by the Lord Mayor. The Recorder is appointed by election from the livery, a former right of the Lord Mayor, and the clerk is appointed by the Corporation.

When the City of London was restored to the King, the city was first governed by a special Act of Parliament, but the Corporation was re-established in 1860, and the Court of Common Hall re-established in 1865, and 1876.

The Corporation was re-established in 1865, and the Court of Common Hall re-established in 1876.

The Corporation was re-established in 1865, and the Court of Common Hall re-established in 1876.

LONDON CLAY—LONDONDERRY, 3rd Marquess of

Constitutional Documents of the City of London (1884, 1887); J. H. Round, The Community of London and Other Studies (1893); Reginald R. Sharpe, London and the Kingdom; a History derived mainly from the Archives at Guildhall (1894); G. L. Gomme, The Governance of London, After the Plague and during the Interregnum (1896); Annals and Exhibitions (1897); Alfred B. Beaven, The Aldermen of the City of London (1898).

In connection with the government of London may be noted works on the City's history, such as Thomas Coe's The History of the Inns of Court and Chancery (1684); Robert P. Pearce, History of the Army (1848). Artillery Company, Anthony Highmore, History of the Artillery Company of London to 1802 (1843); G. A. Radcliffe, History of the Marine Artillery Company (1878). Thomas Arundell published Historical Reminiscences of the Company of London and its Livery Companies. Since then they have appeared The Livery Company of London (1883); The Livery Companies of London, by P. H. Ditchfield (1904); The Guilds and Companies of London, by George Unwin (1908). Separate histories have been published of the chief London companies.

The more important works on the geological history of London have been published: John Graunt, Natural and Political Observations on the Bills of Mortality (1661, other editions 1662, 1665, 1676); Essay in Political Arithmetic (1668); Free Essays on Political Arithmetic (1668–1669); Essays in Political Arithmetic (1669, 1711, 1724, 1755); Essay concerning the Multiplication of Mankind (1682, 1683, 1686), all by Sir William Petty; Corbina Morris, Observations on the Past and Present State of the City of London (1751); Collection of the Yearly Bills of Mortality from 1677 to 1755 (ed. by T. Birch, D.D. 1779); Graunt's Observations, Petty's Another Essay and C. Morris's Observations are reprinted in this collection. Graunt and Petty's Essays are reprinted in Economic Writings by Sir W. Petty (1899).

LONDON CLAY, in geology, the most important member of the Lower Eocene strata in the south of England. It is well developed in the London basin, though not frequently exposed, partly because it is to a great extent covered by more recent gravels and partly because it is not often worked on a large scale. It is a stiff, tenacious, bluish clay that becomes brown on weathering, occasionally it becomes distinctly sandy, sometimes glauconitic, especially towards the top; large calcareous septarian concretions are common, and have been used in the manufacture of cement, being dug for this purpose at Sheppy, near Southend, and at Harwich, and dredged off the Hampshire coast. Nodular lumps of pyrites and crystals of selenite are of frequent occurrence. The clay has been employed for making bricks, tiles and coarse potter, but it is usually too tenacious for this purpose except in well-weathered or sandy portions. The base of the clay is very regularly indicated by a few inches of rounded flint pebbles with green and yellowish sand, partly worked out by being cemented by calcie in a zone of lime. The average thickness of the London Clay in the London basin is about 450 ft.; at Windsor it is 400 ft. thick; beneath London it is rather thicker, while in the south of Essex it is over 480 ft. In Wiltshire it only reaches a few feet in thickness, while in Berkshire it is some 50 or 60 ft. It is found in the Isle of Wight; where it is 300 ft. thick at Whitecliff Bay—here the beds are vertical and even slightly reversed—and in Alum Bay it is 220 ft. thick. In Hampshire it is sometimes known as the Bognor Beds, and certain layers of calcareous sandstone within the clays are called Barnes or Bognor Rock. In the eastern part of the London basin in east Kent the pebbly basement bed becomes a thick deposit (60 ft.), forming part of the Oldhaven and Blackheath Beds.

The London Clay is a lime deposit, and its fossils indicate a moderately warm climate, the flora having a tropical aspect. Among the fossils may be mentioned Panopea intermedia, Briturpa plana, Teredina personata, Conus concinnus, Rossellaria ampila, Nautilus arenatus, foraminifera, and also Ophistocochlias, Podolites obliquus, Sphenomorphus crassidens; birds are represented by Halcyornis Toliaplites, Lithornis and Odonopteryx, and reptiles by Chelone gigas, and other turtles, Palaeophis, a serpent and crocodiles. Helocharium leporinum, Palaeoleporinum and a few other mammals are recorded. In the London Clay, cutaneous conditions are found in great abundance and perfection on the shore of Sheppy; numerous species of palms, screw pines, water lilies, cypresses, yews, leguminous plants and many others occur; logs of coniferous wood bored through by teredo are common and fossil resin has been found at Highgate.

LONDONDERRY, EARLS AND MARQUESSES OF. The 1st earl of Londonderry was Thomas Ridgeway (c.1656–1732), a Devon man, who was treasurer in Ireland from 1660 to 1616 and was engaged in the plantation of Ulster. Ridgeway was made a baronet in 1611, Baron Ridgeway in 1616 and earl of Londonderry in 1623. The Ridgeways held the earldom until March 1714, when Robert, the 4th earl, died without sons. In 1726 Robert's son-in-law, Thomas Pitt (c.1688–1729), son of Thomas Pitt, "Diamond Pitt," governor at Madras and uncle of the great earl of Chatham, was created earl of Londonderry, the earldom again becoming extinct when his youngest son, Ridgeway, the 3rd earl of this line, died unmarried in January 1765.

In 1766 Robert Stewart (1739–1821), of Mount Stewart, Co. Down, was made earl of Londonderry in the Irish peerage. He had been created Baron Londonderry in 1789 and Viscount Castlereagh in 1795; in 1816 he was advanced to the rank of marquess of Londonderry. The 3rd marquess married the heiress of the Vane-Tempests and took the name of Vane instead of Stewart; the 5th marquess called himself Vane-Tempest and the 6th marquess Vane-Tempest-Stewart.

LONDONDERRY, CHARLES WILLIAM STEWART (VANE), 3rd Marquess of (1778–1854), British soldier and diplomatist, was the son of the 1st marquess by a second marriage with the daughter of the 1st Earl Camden. He entered the army and served in the Netherlands (1794) on the Rhine and Danube (1795), in the Irish rebellion (1798), and Holland (1799), rising to the rank of major. As a captain he became secretary for war under his half-brother Castlereagh in 1807. In 1808 he was given a cavalry command in the Peninsula, where he brilliantly distinguished himself. In 1809, and again in the campaigns of 1810, 1811, having become a major-general, he served under Wellington in the Peninsula as his adjutant-general, and was at the capture of Ciudad Rodrigo, but at the beginning of 1812 he was invalided home.

Castlereagh (see LONDONDERRY, 2nd Marquess of) then sent him to Berlin as minister, to represent Great Britain in the allied British, Russian and Prussian armies; and as a cavalry leader he played an important part in the subsequent fighting, while ably seconding Castlereagh's diplomacy. In 1814 he was made a peer as Baron Stewart, and later in the year was appointed ambassador at Vienna, and was a member of the important congresses which followed. In 1822 his half-brother's death made him 3rd marquess of Londonderry, and shortly afterwards, disagreeing with Canning, he resigned, being created Earl Vane (1823), and for some years lived quietly in England, improving his Seamount estates. In 1835 he was for a short time ambassador at St Petersburg. In 1832, after the death of Wellington, when he was one of the pall-bearers, he received the order of the Garter. He died on the 6th of March 1834. He was twice married, first in 1808 to the daughter of the earl of Darley, and secondly in 1820 to the heiress of Sir Harry Vane-Tempest (a descendant of Sir Pieris Tempest, who served at Agincourt, and heir to Sir Henry Vane, Bart.), when he assumed the name of Vane. Frederick William Robert (1805-
1872), his son by the first marriage, became 4th marquess; and on the latter's death in 1872, George Henry (1821-1884), the eldest son by the second marriage, after succeeding as Earl Vane (according to the patent of 1823), became 5th marquess.

In 1884 he was succeeded as 6th marquess by his son Charles Stewart Vane-Tempest-Stewart (b. 1822), a prominent Conservative politician, who was viceregy of Ireland (1866-1869), chairman of the London School Board (1863-1867), postmaster-general (1900-1902), president of the Board of Education (1902-1905) and lord president of the Council (1903-1905).

LONDONDERRY, ROBERT STEWART, 2ND MARQUESS OF (1769-1822), British statesman, was the eldest son of Robert Stewart of Ballylawn Castle, in Donegal, and Mount Stewart in Down, an Ulster landowner, of kin to the Galloway Stewarts, who became baron, viscount, earl and marquess in the peerage of Ireland. The son, known in history as Lord Castlereagh, was born on the 18th of June in the same year as Napoleon and Wellington. His mother was Lady Sarah Seymour, daughter of the earl of Hertford. He went from Armatagh school to St John's College, Cambridge, but left at the end of his first year. With Lord Downshire, then holding sway over the County Down, Lord Stewart had a standing feud, and he put forward his son, in July 1790, for one of the seats. Young Stewart was returned, but at a vast cost to his family, when he was barely twenty-one. He took his seat in the Irish House of Commons at the same time as his friend, Arthur Wellesley, M.P. for Trim, but sat later for two close boroughs in England, still remaining member for Down at College Green.

From 1796, when his father became an earl, he took the courtesy title of Viscount Castlereagh, and becoming keeper of the privy seal in Ireland, he acted as chief secretary, during the prolonged absence of Mr Pelham. From February 1797, Castlereagh's conviction was that, in presence of threatened invasion and rebellion, Ireland could only be made safe by union with Great Britain. In Lord Camden, as afterwards in Lord Cornwallis, Castlereagh found a congenial chief; though his favour with these statesmen was jealously viewed both by the Irish oligarchy and by the English politicians who wished to keep the machine of Irish administration in their own hands. Pitt himself was doubtful of the expediency of making an Irishman chief secretary, but his view was changed by the influence of Cornwallis. In suppressing Lord Edward Fitzgerald's conspiracy, and the rebellion which followed in 1798, Castlereagh's vigilance and firmness were invaluable. His administration was denominated as harsh and cruel—a charge afterwards repudiated by Grattan. Pitt himself, in a letter to Castlereagh, on the side of lenity. The disloyal in Ireland, both Jacobins and priest-led, the Protestant zealots and others who feared the consequence of the Union, coalesced against him in Dublin. Even there Castlereagh, though defeated in a first campaign (1799), impressed Pitt with his ability and tact. With Cornwallis he joined in holding out, during the second Union campaign (1800), the prospect of emancipation to the Roman Catholics. They were aided by free expenditure of money and promises of honours, methods too familiar in Irish politics. When the Act of Union was carried through the Irish parliament, in the summer of 1800, Castlereagh's official connexion with his native land practically ended. Before the Imperial Parliament met he urged upon Pitt the measures which he and Cornwallis thought requisite to make the Union effective. In spite of his services and of Pitt's support, disillusion awaited him. The king's reluctance to yield to the Roman Catholic claims was underestimated by Pitt, while Cornwallis imprudently permitted himself to use language which, though not amounting to a pledge, was construed as one. George III. resented the arguments brought forward by Castlereagh—"this young man" who had come over to talk him out of his coronation oath. He peremptorily refused to sanction emancipation, and Pitt and his cabinet made way for the Addington administration. Thereupon Castlereagh resigned, with Cornwallis. He took his seat at Westminster for Down, the constituency he had represented for ten years in Dublin. The leadership of an Irish party was offered to him, but he declined so to limit his political activity. His father accepted, at Portland's request, an Irish marquessate, on the understanding that in the future he or his heirs might claim the same rank in the Imperial Legislature; so that Castlereagh was able to sit in the House of Commons as Marquess in 1821-1822. Wilberforce discussed with Pitt the possibility of sending out Castlereagh to India as governor-general, when the friction between Lord Wellesley and the directors became grave; but Pitt objected, as the plan would remove Castlereagh from the House of Commons, which should be "the theatre of his future fame."

In 1802, Castlereagh, at Pitt's suggestion, became president of the Board of Control in the Addington cabinet. He had, though not in office, taken charge of Irish measures under Addington, including the repression of the Rebellions Bill, and the temporary suspension of the Habeas Corpus in 1801, and continued to advocate Catholic relief, tithe reform, state payment of Catholic and dissenting clergy and "the steady application of authority in support of the laws." To Lord Wellesley's Indian policy he gave a staunch support, warmly recognized by the governor-general. On Pitt's return to office (May 1804), Castlereagh retained his post, and, next year, took over also the duties of secretary for war and the colonies. Socially and politically, the gifts of his wife, Lady Emily Hobart, daughter of a former Irish viceroy, whom he had married in 1794, assisted him to make his house a meeting-place of the party; and his influence in parliament grew notwithstanding his defects of style, spoken and written. As a manager of men he had no equal. After Pitt's death his surviving colleagues failed to form a cabinet strong enough to face the formidable combination known as "All the Talents," and Castlereagh acquiesced in the resignation. But to the formation of the Fox-Greville ministry and its conduct of the war he was always opposed. His objections to the Whig doctrine of withdrawal from "Continental entanglements" and to the reduction of military expenditure were justified when Fox himself was compelled "to nail his country's colours to the mast."

The cabinet of "All the Talents," weakened by the death of Fox and the renewed quarrel with the king, went out in April 1807. Castlereagh returned to the War Office under Portland, but grave difficulties arose, though Canning at the Foreign Office was then thoroughly at one with him. A priceless opportunity had been missed after Eylau. The Whigs had crippled the transport service, and the operations to avert the ruin of the coalition at Friedland came too late. The Tsar Alexander wished that England would no longer concern herself with the Continental struggle, and Friedland was followed by Tilsit. The secret articles of that compact, denied at the time by the Opposition and by French apologists, have now been revealed from official records in M. Vandal's work, Napoléon et Alexandre. Castlereagh and Canning saw the vital importance of nullifying the aim of this project. The seizure of the Danish squadron at Copenhagen, and the measures taken to rescue the fleets of Portugal and Sweden from Napoleon, crushed a combination as menacing as that defeated at Trafalgar. The expedition to Portugal, though Castlereagh's influence was able only to secure Arthur Wellesley a secondary part at first, soon obscured other issues. In the debates on the Convention of Cintra, Castlereagh defended Wellesley against parliamentary attacks. "A brother," the latter wrote, "could not have done more." The depression produced by Moore's campaign in northern Spain, and the king's repugnance to the Peninsular operations, seemed to cut short Wellesley's career; but early in 1809, Castlereagh, with no little difficulty, secured his friend's appointment as commander-in-chief of the second Portuguese expedition. The merit has been claimed for Canning by Stapleton, but the evidence is all the other way.

Meanwhile, Castlereagh's policy led to a crisis that clouded his own fortunes. The breach between him and Canning was not due to his incompetence in the conduct of the Walcheren expedition. In fact, Castlereagh's election was decided by Canning's intrigues, though concealed from the victim, months before
the armament was sent out to the Scheldt. In the selection of the earl of Chatham as commander the king's personal preference was known, but there is evidence also that it was one of Canning's schemes, as he reckoned, if Chatham succeeded, on turning him into a convenient ministerial figurehead. Canning was not openly opposed to the Walcheren expedition, and on the Peninsular question he mainly differed from Castlereagh and Wellington in fixing his hopes on national enthusiasm and popular uprisings. Military opinion is generally agreed that the plan of striking from Walcheren at Antwerp, the French naval base, was sound. Napoleon heard the news with dismay; in principle Wellington approved the plan. Castlereagh's proposal was for a coup de main, under strict conditions of celerity and secrecy, as Antwerp was unable to make any adequate defence. But Chatham, the naval authorities and the cabinet proceeded with a deliberation explained by the fact that the war secretary had been condemned in secret. The expedition, planned at the end of March, did not reach Walcheren till the end of July 1809; and more time was lost in movements against Batz and Flushing, protracted until an unhealthy autumn prostrated the army, which was withdrawn, disgraced and disabled, in September. Public opinion held the whole blame upon Castlereagh, who then found that, in deference to Canning, his colleagues had decreed his removal half a year earlier, though they kept silence till the troops were brought back from Walcheren. When Castlereagh learned from Percival that the slurr cast on him had its origin in a secret attack on him many months before, he was cruelly hurt. The main charge against him was, he says, that he would not throw over officers on whom unpopularity fell, at the first shadow of ill-fortune. His refusal to rush into censure of Moore, following Canning's sudden change from eulogy to denunciation, requires no defence. According to the ideas then prevailing Castlereagh held himself justified in sending a challenge to the original author, as he held, of a disloyal intrigue against a colleague. In the subsequent duel Canning was wounded and the rivals simultaneously resigned. In private letters to his father and brother, Castlereagh urged that he was bound to show that he "was not privy to his own disgrace." When Canning published a lengthy explanation of his conduct, many who had sided with him were convinced that Castlereagh had been much wronged. The excuse that the protest upon which the cabinet decided against Castlereagh did not mention the minister's name was regarded as a quibble. Men widely differing in character and opinions—Walter Scott, Sidney Smith, Brougham and Cobbett—took this view. Castlereagh loyally supported the government in parliament, after Lord Wellesley's appointment to the Foreign Office. Though Wellington's retreat after Talavera had been included, with the disasters of the Corunna and Walcheren campaigns, in the censures on Castlereagh, and though ministers were often depressed and doubtful, Castlereagh never lost faith in Wellington's genius. Lord Wellesley's resignation in 1812, when the Whigs failed to come to terms with the regent, led to Castlereagh's return to office as foreign secretary (March 1812). The assassination of Percival soon threw upon him the leadership of the House of Commons, and this double burden he continued to bear during the rest of his life.

From March 1812 to July 1827 Castlereagh's biography is, in truth, that of England. Though he never held the technically prime minister, during these years he wielded a power such as few ministers have exercised. Political opponents and personal ill-wishers admitted that he was the ablest leader who ever controlled the House of Commons for so long a period. As a diplomatist, nobody save Marlborough had the same influence over men or was given equal freedom by his colleagues at home. Foreigners saw in him the living presence of England in the camp of the Allies. At the War Office he had been hampered by the lack of technical knowledge, while nature had not granted him, as an organizer, the powers of a Carnot or Roon. But in diplomacy his peculiar combination of strength and charm, of patience and conciliatory adroitness, was acknowledged by all. At the Foreign Office he set himself at once to meet Napoleon's designs in northern Europe, where Russia was preparing for her life-and-death struggle. Lord Wellesley paid a high tribute to Castlereagh's conduct in this situation, and Wellington declared that he had then "rendered to the world the most important service that ever fell to the lot of any individual to perform." Castlereagh wisely rejected Napoleon's insincere overtures for peace. After the Moscow débâcle Napoleon's fate was affected not only by Wellington's progress in Spain, but by the attitude of the northern powers and by the action of Turkey, due to Castlereagh's opportune disclosure to the Porte of the scheme of partition at Tilsit. At home, the repeal of the Orders in Council was carried, the damage to British trade plainly outweighing the injury inflicted on France by the restrictive system. The British subsidies to the Allies were largely increased as the operations of 1813 developed, but all Castlereagh's skill was needed to keep the Coalition together. The Allied powers were willing, even after Leipzig, to treat with France on the basis of restoring her "natural frontiers"—the Rhine, the Alps and the Pyrenees; but Castlereagh protested. He would not allow the enemy to take ground for another tiger-spring. Before the Conference of Châtillon, where Napoleon sent Caulaincourt to negotiate for peace—with the message scribbled on the margin of his instructions—" <l>we shall not hasten Castlereagh's coming. "Everything which has been so long smothered is now bursting forth"; and again, "Your presence has done much and would, I have no doubt, continue to sustain them (the Allies) in misfortune." The Liverpool cabinet then and later were as urgent in pressing him to return to lead the House of Commons. He had lost his seat for Down in 1805, and afterwards sat for British boroughs; but in 1812 he was re-elected by his old constituents; and again in 1818 and 1820, sitting, after he became marquess of Londonderry in 1821, for Orford. Early in 1814 his colleagues reluctantly consented to his visit to the allied head-quarters. The Great Alliance showed signs of weakness and division. Austria was holding back; Prussia had almost broken away; above all, the ambiguous conduct of Alexander bred alarm and doubt. This situation became increasingly serious while Napoleon was giving daily proofs that his military genius, confronting a hesitant and divided enemy, was at its best. Castlereagh strove to keep the Allies together, to give no excuse for those separate arrangements upon which Napoleon was reckoning, to assert no selfish policy for England, to be tied by no theoretical consistency. At the Châtillon conferences England was represented by others, but Castlereagh was present with supreme authority over all, and it was he who determined the result. He declined to commit his country either to a blank refusal to negotiate with Napoleon or to the advocacy of a Bourbon restoration. He was ready to give up almost the whole of England's conquests, but he insisted on the return of France within her ancient limits as the basis of a settlement. Caulaincourt's advice was to take advantage of these overtures; but his master was not to be advised. The counter-projects that he urged Caulaincourt to submit to were advanced after his victory at Montereau, when he boasted that he was nearer to Munich than the Allies were to Paris. Even before the Châtillon conference was dissolved (March 1814), Castlereagh saw that Caulaincourt's efforts would never bend Napoleon. He signed the treaty of Chaumont (March 1814), "my treaty," as Castlereagh called it, with an unusual touch of personal pride; adding "Upon the face of the treaty this year our engagement is equivalent to theirs united." The power of England when she threw her purse into the scale had been just exhibited at Bar-sur-Aube, when at a council of all the representatives of the powers the retreat of the allied armies was discussed. Bernadotte, playing a waiting game in Holland, was unwilling to reinforce Blücher, then in a dangerous position, by the Russian and Prussian divisions of Winzingereon and Bülow, temporarily placed under his orders. Having asked for and received the assurance that the military leaders were agreed in holding the transfer necessary, Castlereagh declared that he took upon himself the responsibility of bringing the Swedish prince to reason. The withholding of the British subsidies was a vital
matter, not only with Bernadotte but with all the powers. Castlereagh's avowed intention to take this step without waiting for sanction from his cabinet put an end to evasion and delay. Blücher was reinforced by the two divisions; the battle of Laon was fought and won, and the ill-starred expedition of the French capital followed.

In April 1814, Castlereagh arrived in Paris. He did not disguise his discontent with Napoleon's position at Elba, close to the French coast, though he advised England not to separate herself at this crisis from her allies. His unbusiness led him to summon Wellington from the south to the Embassy in Paris. He hastened himself to London during the visit of the allied sovereigns, and met with a splendid reception. He was honoured with the Garter, being one of the few commoners ever admitted to that order. When the House of Commons offered to the Crown its congratulations upon the treaty of peace, Castlereagh's triumph was signified by a brilliantly eloquent panegyric from Canning, and by a recantation of his former doubts and denunciations from Whitbread. His own dignified language vindicated his country from the charge of selfish ambition.

His appointment as British representative at Vienna, where the congress was to meet in September, was foreseen; but meanwhile he was not idle. The war with the United States, originating in the non-intercourse dispute and the Orders in Council, did not cease with the repeal of the latter. It lasted through 1814 till the signing of the treaty of Ghent, soon before the flight from Elba. In parliament the ministry, during Castlereagh's absence, had been poorly championed. Canning had thrown away his chance by his unwise refusal of the Foreign Office. None of the ministers had any pretension to lead when Castlereagh was busy abroad and Canning was sitting at home, and Castlereagh's letter to Van Sittart, the chancellor of the exchequer, show how these difficulties weighed upon him in facing the position at Vienna, where it was imperative for him to appear. At Vienna he realized at once that the ambition of Russia might be as formidable to Europe and to Great Britain as that of the fallen tyrant. His aim throughout had been to rescue Europe from military domination; and when he found that Russia and Prussia were pursuing ends incompatible with the general interest, he did not hesitate to take a new line. He brought about the secret treaty (Jan. 3, 1815) between Great Britain, Austria, and France, directed against the plans of Russia in Poland and of Prussia in Saxony. Through Castlereagh's efforts, the Polish and Saxon questions were settled on the basis of compromise. The threat of Russian interference in the Low Countries was dropped.

While the Congress was still unfinished, Napoleon's escape from Elba came like a thunderclap. Castlereagh had come home for a short visit (Feb. 1815), at the urgent request of the cabinet, just before the flight was known. The shock revived the Great Alliance under the compact of Chaumont. All energies were directed to preparing for the campaign of Waterloo. Castlereagh's words in parliament were, "Whatever measures you adopt or decision you arrive at, must rest on your own power and not on reliance on this man." Napoleon promptly published the secret treaty which Castlereagh had concluded with Metternich and Talleyrand, and the last left in the French archives. But Russia and Prussia, though much displeased, saw that, in the face of Bonaparte's return, they dared not weaken the Alliance. British subsidies were again poured out like water. After Napoleon's overthrow, Castlereagh successfully urged his removal to St Helena, where his custodians were charged to treat him "with all the respect due to his rank, but under such precautions as should render his escape a matter of impossibility." Some of the continental powers demanded, after Waterloo, fines and cessions that would have crushed France; but in November a peace was finally concluded, mainly by Castlereagh's endeavours, minimising the penalties exacted, and abandoning on England's part the whole of her share of the indemnity. The war created an immense financial burden but helped to pay for the Appin; the Whigs and Radicals, previously disliked by their hostility to a patriotic struggle. In 1815 the Income Tax was remitted, despite Castlereagh's contention that something should first be done to reduce the Debt Charge. His policy, impressed upon British representatives abroad, was "to turn the confidence Great Britain inspired to the account of peace, by exercising a conciliatory influence in Europe," Brougham's action, at the end of 1814, to repeal the last act of the Holy Alliance, even in the interest of his personal position, was calculated to embarrass England, though she was no party to what Castlereagh described as a "piece of sublime mysticism and nonsense."

While he saw no reason in this for breaking up the Grand Alliance, which he looked upon as a convenient organ of diplomatic intercourse and as essential for the maintenance of peace, he regarded with alarm "the little spirit of German intrigue," and agreed with Wellington that to attempt to crush France, as the Prussians desired, or to keep her in a perpetual condition of tutelage under a European concert from which she herself should be excluded, would be to invite the very disaster which it was the object of the Alliance to avoid. It was not till Metternich's idea of extending the scope of the Alliance, by using it to crush "the revolution" wherever it should raise its head, began to take shape, from the conference of Aix-la-Chapelle (1818) onward, that Great Britain's separation from her continental allies became inevitable. Against this policy of the reactionary powers Castlereagh from the first vigorously protested. As little was he prepared to accept the visionary schemes of the emperor Alexander for founding an effective "confederation of Europe" upon the inclusive basis of the Holy Alliance (see ALEXANDER I. of Russia).

Meanwhile financial troubles at home, complicated by the resumption of cash payments in 1819, led to acute social tension. "Peterloo" and the "Six Acts" were furiously denounced, though the bills introduced by Sidmouth and Castlereagh were carried in both Houses by overwhelming majorities. The danger that justified them was proved beyond contest by the Cato Street Conspiracy in 1820. It is now admitted by liberal writers that the "Six Acts," in the circumstances, were reasonable and necessary. These events, Castlereagh maintained his tranquil ascendency in the House of Commons, though his few colleagues who were capable of standing up against Brougham. Canning, indeed, had returned to office and had defended the "Six Acts," but Castlereagh bore the whole burden of parliamentary leadership, as well as the enormous responsibilities of the Foreign Office. His appetite for work caused him to engage in debates and inquiries on financial and legal questions when he might have delegated the task to others. Althorp was struck with his unseeling energy on the Agricultural Distress Committee; "his exertions, coupled with his other duties—and unfortunately he was always obstinate in refusing assistance—strained his constitution fearfully, as was shown by his careworn brow and increasing paleness." In 1821, on Sidmouth's retirement, he took upon himself the laborious functions of the Home Office. The diplomatic situation had become serious. The policy of "intervention," with which Great Britain had consistently refused to identify herself, had been proclaimed to the world by the famous Troppau Protocol, signed by Russia, Austria, and Prussia (see TROPPAU, CONGRESS OF). The immediate occasion was the revolution at Naples, where the egregious Spanish constitution of 1812 had been forced on the king by a military rising. With military revolts, as with paper constitutions of an unworkable type, Castlereagh had no sympathy; and in this particular case the revolution, in his opinion, was wholly without excuse or palliation. He was prepared to allow the intervention of Austria, if she considered her rights under the treaty of 1815 violated, or her position as an Italian Power imperilled. But he protested against the general claim, embodied in the Protocol, of the European powers to interfere, uninvited, in the internal concerns of sovereign states; he refused to make Great Britain, even tacitly, a party to such interference, and again insisted that her part in the Austrian Alliance was defined by the crisis in which she was not prepared to go.

In no case, he affirmed, would Great Britain "undertake the moral responsibility for administering a general European police," which she would never tolerate as applied to herself.

To Troppau, accordingly, no British plenipotentiary was
sent, since the outcome of the conferences was a foregone conclusion; though Lord Stewart came from Vienna to watch the course of events. At Laibach an attempt to revive the Troppau proposals was defeated by the firm opposition of Stewart; but a renewal of the struggle at Verona in the autumn of 1822 was certain. Castlereagh, now marquis of Londonderry, was again to be the British representative, and he drew up for himself instructions that were handed over unaltered by Canning, his successor at the Foreign Office, to the new plenipotentiary, Wellington. In the threatened intervention of the continental powers in Spain, as in their earlier action towards Naples and Sardinia, England refused to take part. The Spanish revolutionary movement, Castlereagh wrote, "was a matter with which, in the opinion of the English cabinet, no foreign power had the smallest right to interfere." Before, however, the question of intervention in Spain had reached its most critical stage the development of the Greek insurrection against the Ottoman government brought up the Eastern Question in an acute form, which profoundly modified the relations of the powers within the Alliance, and again drew Metternich and Castlereagh together in common dread of an isolated attack by Russia upon Turkey. A visit of King George IV. to Hanover, in October 1821, was made the occasion of a meeting between Lord Londonderry and the Austrian chancellor. A meeting so liable to misinterpretation was in Castlereagh's opinion justified by the urgency of the crisis in the East, "a practical consideration of the greatest moment," which had nothing in common with the objectionable "theoretical" question with which the British government had refused to concern itself. Yet Castlereagh, on this occasion, showed that he could use the theories of others for his own practical ends; and he joined cordially with Metternich in taking advantage of the emperor Alexander's devotion to the principles of the Alliance to prevent his taking an independent line in the Eastern Question. It was, indeed, the belief that this question would be made the matter of comity and of discussion at the congress that led Castlereagh to agree to be present at Verona; and in his Instructions he foreshadowed the policy afterwards carried out by Canning, pointing out that the development of the war had made the recognition of the belligerent rights of the Greeks inevitable, and quoting the precedent of the Spanish American colonies as exactly applicable. With regard to the Spanish colonies, moreover, though he was not as yet prepared to recognize their independence de jure, he was strongly of opinion that the Spanish government should do so since "other states would acknowledge them sooner or later, and it is to the interest of Spain herself to find the means of restoring an intercourse when she cannot succeed in restoring a dominion."

But the tragic ending of Castlereagh's strenuous life was near; and the credit of carrying out the policy foreshadowed in the Instructions was to fall to his rival Canning. Lord Londonderry's exhaustion became evident during the conference sessions; and Wellington was struck by his overwrought condition, which his family attributed to an attack of the gout and the lowering remedies employed. Wellington warned Dr Bankhead that Castlereagh was unwell, and, perhaps, mentally disordered. Bankhead went down to North Cray and took due precautions. Castlereagh's razors were taken away, but a penknife was forgotten in a drawer, and with this he cut his throat (August 12, 1822). He had just before said, "My mind, my mind, is, as it were, gone"; and, when he saw his wife and Bankhead talking together, he moaned "there is a conspiracy laid against me." It was as clear a case of brain disease as any on record. But this did not prevent his enemies of the baser sort from asserting, without a shadow of proof, that the suicide was caused by terror at some hideous and undefined charge. The testimony of statesmen of the highest character and of all parties to Castlereagh's gifts and charm is in strong contrast with the flood of vituperation and calumny poured out upon his memory by those who knew him not.

Bibliography.—Castlereagh's correspondence and papers were published by his brother and successor (1859-1853) in twelve volumes. Sir Archibald Alison's Biography in three volumes came out in 1861, with copious extracts from the manuscripts preserved at Wynyard. It was made the subject of an interesting essay in the Quarterly Review for January 1862, reprinted in Essays by the late Marquis of Salisbury (London, 1895). A graceful sketch of Theresa, Marchioness of Londonderry (London, 1904), originally brought out in the Anglo-Saxon Review, contains some extracts from Castlereagh's unpublished correspondence with his wife, the record of an intimate and passionate attachment which threw a new light on the man.

E. D. J. W.
Protestant Episcopalians. Londonderry (pop. 38,892), Coleraine (6958) and Limavady (2692) are the principal towns, while Magherafelt and Moneymore are lesser market towns. The county comprises six baronies. Assizes are held at Londonderry, and quarter sessions at Coleraine, Londonderry and Magherafelt. The county is represented in parliament by two members, for the north and south divisions respectively. The Protestant and Roman Catholic dioceses of Armagh, Derry and Down each include parts of the county.

At an early period the county was inhabited by the O' Cathans or O'Catrans, who were tributary to the O' Neills. Towards the close of the reign of Elizabeth the county was seized, with the purpose of checking the power of the O' Neills, when it received the name of Coleraine, having that town for its capital. In 1609, after the confiscation of the estates of the O' Neills, the citizens of London obtained possession of the towns of Londonderry and Coleraine and adjoining lands, 60 acres out of every 1000 being assigned for church lands. The common council of London undertook to expend £20,000 on the reclamation of the property, and elected a body of twenty-six for its management; who in 1613 were incorporated as the Irish Society, and retained possession of the towns of Londonderry and Coleraine, the remainder of the property being divided among twelve of the great livery companies. Their estates were sequestered by James I., and in 1637 the charter of the Irish Society was cancelled. Cromwell restored the society to its former position, and Charles II. at the Restoration granted it a new charter, and confirmed the companies in their estates. In the insurrection of 1641 Moneymore was seized by the Irish, and Magherafelt and Bellaghy, then called Vintner's Town, burned, as well as other towns and villages. There are several stone circles, and a large number of artificial caves. The most ancient castle of Irish origin is that of Carrickreagh; and of the castles erected by the English those of Dungiven and Muff are in good preservation. The abbey of Dungiven, founded in 1109, and standing on a rock about 500 ft. above the river Roe, is a picturesque ruin. Maghera, the ancient Roman Catholic barony, included the Barony of Magheraboy, and was situated about two miles from Limavady, was granted by Bishop Madden to the Earl of Strabane, and the property there onward was assigned to the Protestant lands. It was occupied by a quadrangular area from which the main streets diverge. Some old houses with high pyramidal gables remain but are much modernized. The Protestant cathedral of St. Columba, in Perpendicular style, was completed from the design of Sir John Vanbrugh in 1633, at a cost of 4000000. The work was not completed and was enlarged in 1787. The spire was added in 1778 and rebuilt in 1802. The bishop's palace, erected in 1716, occupies the site of the abbey founded by Columba. The abbot of this monastery, on being made bishop, erected in 1164 Temple More or the "Great Church," one of the finest buildings in Ireland previous to the Anglo-Norman invasion. The ancient abbey church was called the "Black Church," but both it and the "Great Church" were demolished in 1600 and their materials used in fortifying the city. There is a large Roman Catholic cathedral, erected c. 1870 and dedicated to St. Eugenius. For Foyle College, founded in 1617, a new building was erected in 1814. This and the Academy Institution, a foundation of 1808, were amalgamated in 1866. Magee College, taking its name from its foundress, Mrs Magee of Dublin, was instituted in 1857 as a training-school for the Presbyterian ministry.

The staple manufacture of the town is linen (especially shirting-making), and there are also shipbuilding yards, iron-foundries, saw-mills, manure-works, distilleries, breweries and flour-mills. The salmon fishery on the Foyle is valuable. The river affords a commodious harbour, its greatest depth being 33 ft. at high tide, and 12 ft. at low tide. It is under the jurisdiction of the Irish Society. The port has a considerable shipping trade with Great Britain, exporting agricultural produce and provisions. Regular services of passenger steamers serve Londonderry from Glasgow, Liverpool, Morecambe, Belfast and local coast stations. In 1808 Londonderry was constituted one of the six county boroughs which have separate county councils.

About 5 m. W. of the city, on a hill 803 ft. high, is a remarkable fort, consisting of three concentric ramparts, and an interior fortification of stone. It is named the Grianan of Aileach, and was a residence of the O' Neills, kings of Ulster. It was restored in 1878.

Derry, the original name of Londonderry, is derived from Doire, the "place of oaks." It owes its origin to the monastery founded by Columba about 546. With the bishopric which arose in connexion with this foundation, that of Raphoe was amalgamated in 1834. From the 9th to the 11th century the town was frequently in the possession of the Danes, and was often devastated, but they were finally driven from it by Murtagh O'Brien about the beginning of the 12th century. In 1131 it was granted by Edward II. to Richard de Burgh. After the Irish Society of London obtained possession of it, it was incorporated in 1613 under the name of Londonderry. From this year until the Union in 1800 two members were returned to the Irish parliament. The fortifications, which were begun in 1600, were completed in 1618. In 1688 Derry had become the chief stronghold of the Protestants of the north. On the 7th of December certain of the apprentices in the city practically put themselves and it in a stage of siege by closing the gates, and on the 10th of April 1689 the forces of James II. began in earnest the famous siege of Derry. The rector of Donaghmore, George Walker, who, with Major Baker, was chosen to govern Derry, established fame for himself for his bravery and hopefulness during this period of privation, and the historic answer of "No surrender" from the watchword of the men of Derry, was given to the proposals of the besiegers. The garrison was at the last extremity when, on the 30th of July, ships broke through the obstruction across the harbour and brought relief. Walker and the siege are commemorated by a lofty column (1828), bearing a statue of the governor, on the Royal Bastion, from which the town standards defied the enemy; and the anniversary of the relief is still observed.

LONG, GEORGE (1800-1879), English classical scholar, was born at Poulton, Lancashire, on the 4th of November 1800, and educated at Macclesfield grammar-school and Trinity College, Cambridge. He was Craven university scholar in 1821 (bracketed with Lord Macaulay and Henry Melden), wrangler and senior chancellor's medallist in 1822 and became a fellow of Trinity in 1823. In 1824 he was elected professor of ancient languages in the new university of Virginia at Charlottesville, U.S.A., but after four years returned to England as the first Greek professor at the newly founded university of London. In 1842 he succeeded T. H. Key as professor of Latin at University College; in 1846-1849 he was reader in jurisprudence and civil law in the Middle Temple, and finally (1849-1871) classical lecturer at Brighton College. Subsequently he lived in retirement at Porfield, Chichester, in receipt (from 1872) of a Civil List pension of £100 a year obtained for him by Gladstone. He was one of the founders (1830), and for twenty years an officer, of the Royal Geographical Society; an active member of the Society for the Diffusion of Useful Knowledge, for which he edited the quarterly Journal of Education (1831-1835) as well as many of its text-books; the editor (at first with Charles Knight, afterwards alone) of the Penny Cyclopaedia and of Knight's Political Dictionary; and a member of the Society for Central Education instituted in London in 1837. He contributed the Roman law articles to Smith's Dictionary of Greek and Roman Antiquities, and wrote also for the companion dictionaries of Biography and Geography. He is remembered, however, mainly as the editor of the Bibliotheca Classica series—the first serious attempt to produce scholarly editions of classical texts
with English commentaries—to which he contributed the edition of Cicero's Orations (1851–1862). He died on the 20th of August 1879.

Among his other works are: Summary of Herodotus (1829); editions of Herodotus (1830–1833) and Xenophon's Anabasis (1831); revised editions of J. A. Maclean's Juvenal and Persius (1867) and Horace's Odes (1890); translations of the Gesta Regum Anglorum and of the Confessio Anglicana, the latter of thirteen of Plutarch's Lives (1844–1848); translations of the Thoughts of Marcus Aurelius (1862) and the Discourses of Epictetus (1877); Decline of the Roman Republic (1864–1874), 5 vols. (See H. J. Matthews, "In Memoriam," reprinted from the Brighthelm College Magazine, 1879.

LONG, JOHN DAVIS (1838– ), American lawyer and political leader, was born in Buckingham, Oxford county, Maine, on the 27th of October 1838. He graduated at Harvard in 1857, studied law at the Harvard Law School and in 1861 was admitted to the bar. He practised in Boston, became active in politics as a Republican, was a member of the Massachusetts House of Representatives in 1873–1878 and its speaker in 1876–1878, lieutenant-governor of the state in 1879, and governor in 1880–1882. In 1882–1889 he was a member of the National House of Representatives, and from March 1890 to May 1902 was secretary of the navy, in the cabinet, first of President McKinley and then of President Roosevelt. In 1902 he became president of the Board of Overseers of Harvard College. His publications include a version of the Aeneid (1879), After-Dinner and Other Speeches (1895) and The New American Navy (1903).

LONG BRANCH, a city of Monmouth county, New Jersey, U.S.A., on the easternmost or "long" branch of the Shrewsbury river and on the Atlantic coast, about 30 m. S. of New York City. Pop. (1890) 7231; (1900) 8872, of whom 1431 were foreign-born and 987 were negroes; (1910 census) 13,298. It is served by the Pennsylvania, the Central of New Jersey, the New York & Long Branch, and electric railways, and by steamboats to New York. It is a resort and the history of the river is good. Long Branch is one of the oldest American watering-places. It is situated on a bluff which rises abruptly 20-35 ft. above the beach, and along the front of which boardwalks and jetties have been erected as a protection from the waves; along or near the edge of the bluff, Ocean Avenue, 60 ft. wide and about 3 m. long (from Seabright to Deal), commands delightful views of the ocean. A "bluff walk" runs above the water for 2 m. The city has one public park, Ocean Park (about 10 acres), and two privately owned parks, one of which is Pleasure Bay Park (25 acres), on the Shrewsbury river, where oars are given in the open air. The principal public institutions are the Monmouth Memorial Hospital and the Long Branch Circulating Library. In Long Branch the Monmouth County House of Records was held annually in July. The southern coast contains some beautiful summer residences—in one of its cottages General U. S. Grant spent his summers for many years, and in another, the Fracklyn, President J. A. Garfield died in 1881. In 1909 a monument to Garfield was erected in Ocean Park. Adjoining Long Branch on the N. is the borough of Monmouth Beach (incorporated in 1906; population, 1910, 485). Before the War of Independence the site of Long Branch was owned by Colonel White, a British officer. It was confiscated as a result of the war, and late in the century its development as a watering-place began. Long Branch was chartered as a city in 1904.

LONGCHAMP, WILLIAM (d. 1107), chancellor of England and bishop of Ely, entered public life at the close of Henry II.'s reign as official to the king's son Geoffrey, for the archdeacon of Worcestershire. Henry II. put him in his diocese as superintendent or "son of two traitors." He soon deserted Geoffrey for Richard, who made him chancellor of the duchy of Aquitaine. He always showed himself an able diplomatist. He first distinguished himself at Paris, as Richard's envoy, when he defeated Henry II.'s attempt to make peace with Philip Augustus (1180). On Richard's accession William became chancellor of the kingdom and bishop of Ely. When Richard left England (Dec. 1189), he put the tower of London in his hands and chose him to share with Hugh de Puiset, the great bishop of Durham, the office of chief justiciar. William immediately quarrelled with Hugh and by April 1190 had ousted him completely from office. In June 1190 he received a commission as legate from Pope Celestine. He was then master in church as well as state. But his disagreeable appearance and manners, his pride, his contempt for everything English made him detested. His progresses through the country with a train of a thousand knights were ruinous to those on whom devolved the burden of entertaining him. Even John seemed preferable to him. John returned to England in 1191; and his adherents were immediately involved in disputes with William, who was always worsted. At last (June 1191) Geoffrey, archbishop of York and William's earliest benefactor, was violently arrested by William's subordinates on landing at Dover. They exceeded their orders, which were to prevent the archbishop from entering England until he had sworn fealty to Richard. But this outrage was made a pretext for a general rising against William, whose legitimate commission had now expired, and whose power was balanced by the presence of the archbishop of Rouen, Walter Courtenay, with a commission from the king. William shut himself up in the Tower, but he was forced to surrender his castles and expelled from the kingdom. In 1193 he joined Richard in Germany, and Richard seems to have attributed the settlement soon after concluded between himself and the emperor, to his "dearest chancellor." For the rest of the reign Longchamp was employed in confidential and diplomatic missions by Richard all over the continent, in Germany, in France and at Rome. He died in January 1197. His loyalty to Richard was unwavering, and it was no doubt through his unscrupulous devotion to the royal interest that he incurred the hatred of Richard's English subjects.

LONGCLOTH, a plain cotton cloth originally made in comparatively long pieces. The name was applied particularly to cloth made in India. Longcloth, which is now commonly bleached, comprehends a number of various qualities. It is heavier than cambric, and finer than medium or Mexican. As it is used principally for underclothing and shirts, most of the longcloth sold in Great Britain passes through the hands of the shirt and underclothing manufacturers, who sell to the shopkeepers, though there is still a considerable if decreasing retail trade in piece-goods. The lower kinds of longcloth, which are made from American cotton, correspond in quality to the better kinds of "shirting" made for the East, but the best longcloths are made from Egyptian cotton, and are fine and fairly costly goods.

LONG Eaton, an urban district in the Ilkeston parliamentary division of Derbyshire, England, 10 m. E.S.E. of Derby, on the Midland railway. Pop. (1891) 9636; (1901) 13,045. It lies in the open valley of the Trent, at a short distance from the river, and near the important Trent Junction on the Midland railway system. The church of St Lawrence has Norman portions, and an arch and window apparently of pre-Conquest date. The large industrial population of the town is occupied in the manufacture of lace, which extended hither from Nottingham; there are also railway carriage works. To the north is the township of Sandiacre (pop. 2954), where the church has a fine Decorated chancel.

LONGEVITY, a term applied to express either the length or the duration of life in any organism, but, as cases of long duration are of high interest, frequently used to denote a relatively unusual prolongation of life. There is no reason to suppose that protoplasm, the living material of organisms, has a necessarily limited duration of life, provided that the conditions proper to it are maintained, and it has been argued that since every living organism comes into existence as a piece of the protoplasm of a pre-existing living organism, protoplasm is potentially immortal. Living organisms exist, however, as particles or communities of particles of protoplasm (see Life), and as such have a limited duration of life. Longevity, as E. Ray Lankester pointed out in 1869, for practical purposes must be understood
LONGEVITY

975

to mean the "length of time during which life is exhibited in an individual." The word "individual" must be taken in its ordinary sense as in the case of partially independent, organized mass produced from a pre-existing organized mass, as otherwise the problem will be confused by arguments as to the meaning of biological individuality.

Empirical Data.—A multitude of observations show that only a very brief life, ranging from a few hours to a few days, is the normal fate of the vast majority of single-celled organisms, whether these be animal or vegetable on the border-line between the two kingdoms. Death comes to them rapidly from internal or external causes, or the individual life ends in conjugation or division or spore-formation. Under special conditions, natural or artificial, the individual life may be prolonged by desiccation, or freezing, or by some similar arrest of functional activity.

The duration of life among plants is varied. The popular division into annuals, biennials and perennials is not absolute, for natural and artificial conditions readily prolong the lives of annuals and biennials for several seasons, whereas the case of perennials is much complicated by the mode of growth, and the problem of individuality, however we desire to exclude it, obstructs itself. In a very few cases, of a simple individual, its life is short, ranging from a few days in the case of fungi, to two seasons in the case of biennial herbs. Most of the simple algae are annual, their life enduring only for part of the year; the branching algae are more often perennial, but in their cases not only are observations as to duration lacking, but however simply we may use the term individual, its application is difficult. The larger terrestrial plants with woody tissues which we denote roughly as shrubs and trees have an individuality which, although different from that of a hyacint or carrot, is usually obvious. Shrubs live from four to ten or more years, and it apparently is the case that odoriferous shrubs such as sage and lavender display the longer duration. Trees with soft wood, such as poplars and willows, last for about fifty years, fruit-trees rather longer. Estimates of the age which large trees can attain, based partly on attempts to count the annual rings, have been given by many writers, and range from about three hundred years in the case of the elm to three to five thousand years in the case of Sequoia gigantea. In the absence of any rings, the age of the baobab (Adansonia digitata) of Cape Verde. It is impossible to place exact reliance on these estimates, but it is at least certain that very many trees have a duration of life exceedingly great in comparison with the longest-lived animals.

The duration of life amongst multicellular invertebrate animals is little known, except in the frequent instances where it is normally brief. Many sponges and polyps die at the end of the season, leaving winter eggs or buds. The much-branched masses of the larger sponges and compound hydrozoa certainly may be perennial. A sea-anemone (Actinia mesembryanthemum), captured in 1828 by Sir John Dalley, a Scottish naturalist, and then guessed to be about seven years old, lived in captivity in Edinburgh until 1887, the cause of death being unknown. As other instances of great ages attained by sea-anemones are on record, it is plain that these animals, although simple polyps, are long-lived. Echinoderms are inferred to live to considerable ages, as they grow slowly and as there is great difference in size amongst fully adult specimens. On similar reasoning, consider the age to be attributed to some large molluscs, but the smaller forms in many cases are known to have very short lives. The variation in the length of life of molluscs appears to be great. Many species of gastropods live only a few years; others, such as Natica horus, have reached thirty years, whilst the large Tridacna gigas is stated to live from sixty to a hundred years. Among insects, the adult stage has usually only a very short duration of life, extending from a few hours to a few months, but the larval stages may last much longer. Including these latter, the range of duration among insects, taking the whole life from hatching to death, appears to lie between the limits of a few weeks in the case of plant-lace to seventeen years in the case of the American Cicada septemdecim, the larva of which lives seventeen years, the adult only a month. Most butterflies are annuals, but those which fail to copulate may hibernate and live through a second season, whilst the lives of some have been preserved artificially for seven years. Worker bees and drones do not survive the season, but queens may live from two to five years. In the case of vertebrates, the duration of life appears to be greater among fish and reptiles than among birds and mammals. The ancient Romans have noted that eels, kept in aquaria, could reach the age of sixty years. Estimates based on size and rate of growth have led to the inference that salmon may live to the age of a hundred years, whilst G. L. Buffon set down the period of life of carp in ponds as one hundred and fifty years, and there is evidence for a pike having reached the age of over two centuries. More recently it has been claimed that the age of fish can be ascertained exactly by counting the annual rings of the otoliths. No great ages have as yet been recorded by this method, whilst, on the other hand, by revealing great variations of weight and size in fishes with the same number of annual rings, it has thrown doubt on the validity of estimates of age based on size and rate of growth. The evidence as a whole is unsatisfactory, but it is highly probable that in the absence of accidents most fish attain an age of not more than five years. The duration of life among batrachia is little known, but small frogs have been recorded as living over twelve years, and toads up to thirty-six years.

Almost nothing is known as to the longevity of snakes and lizards, but it is probable that no great ages are reached. Crocodiles, alligators and caymans grow slowly and are believed to live very long. There is exact evidence as to alligators in captivity in Europe reaching forty years without signs of senescence, and some of the sacred crocodiles of India are believed to be more than a hundred years old. Chelonians live still longer. A tortoise has lived for eighty years in the garden of the governor of Cape Town, and is believed to be at least two hundred years old. There are records of small land-tortoises that have been kept in captivity for over a century, whilst the very large tortoises of the Galapagos Islands certainly attain ages of at least two centuries and possibly much more. A considerable body of information exists regarding the longevity of birds, and much of this has been brought together by J. H. Gurney. From his lists, which include more than fifty species, it appears that the duration is least in the case of small passerine and pipit birds, where it ranges from eight or nine years (goat-suckers and swifts) to a maximum of twenty-five years, the latter age having been approached by larks, canaries and goldfinch. Gulls have been recorded as living over forty years, ducks and geese over fifty years (the duchess of Bedford has recorded the case of a Chinese goose having been in possession of the same family for fifty-seven years). Parrots frequently live over eighty years, swans nearly as long, ravens and owls rather less, whilst there is excellent evidence of eagles and falcons considerably exceeding a hundred years. Notwithstanding their relatively large size, struthious birds do not reach great ages. The records for cassowaries and rheas do not exceed thirty years, and the maximum for ostriches is fifty years, and that on doubtful evidence.

Exact records regarding the longevity of mammals are surprisingly few. There is no evidence as to Monotremes. The life of Marsupials in captivity is seldom long; a phalanger has lived in the London Zoological Gardens and showed no signs of age from thirty to thirty-five years; it may be inferred that the larger forms are capable of living longer. Reliable records as to Edentates do not exist; those in captivity have short lives, but the size and structure of some of the extinct forms suggests that they may have reached a great age. Nothing is known regarding the longevity of Sireniens, except that they do not live long in captivity. In the case of Cetaceans, estimates based on the growth of whale-bone assign an age of several centuries to whale-bone whales; exact records do not exist. More is known regarding Ungulates, as many of these are domesticated, semi-domesticated or are frequently kept in captivity. Great length of life has been assigned to the rhinoceros, but the longest actual
LONGEVITY

record is that of an Indian rhinoceros which lived for thirty-seven years in the London Zoological Gardens. The usual duration of life in the case of horses, asses and zebras is from fifteen to thirty years, but instances of individuals reaching fifty years are fairly well authenticated. Domestic cattle may live from twenty-five to thirty years, sheep and goats from twelve to fourteen years, antelopes rather longer, especially in the case of the larger forms. A giraffe has lived for nineteen years in the London Zoological Gardens. Deer are reputed to live longer than sheep, and records of individuals at the London Gardens confirm this, but it is doubtful if they live as long as cattle. Camels are long-lived, according to repute, but actual records show no great age; a llama which died in the London Gardens at the age of seventeen years showed unmistakable signs of senility. The hippopotamus is another large ungulate to which great longevity has been assigned, but the longest actual record is the case of a female born in the London Gardens which died in its thirty-fifth year. The duration of life assigned to domestic swine is about twenty years; an Indian wild boar, alive in the London Zoological Gardens in 1910, and apparently in full vigour, was fifteen years old. Elephants are usually supposed capable of reaching great ages, but the actual records of menagerie and military animals show that thirty to forty years is a normal limit. Facts as to rodents are not numerous; the larger forms such as hares and rabbits may live for ten years, smaller forms such as rats and mice, for five or six years. Bats have a reputation for long duration of life, and tropical fruit-bats are known to have lived for seventeen years. No great ages have been recorded for Carnivora, but the average is fairly high. Twenty-five years appears to be a limit very rarely exceeded by lions, tigers or bears; domestic cats may live for from twelve to twenty-three years, and dogs from sixteen to eighteen years, though cases of as many as thirty-four years have been noted. Less is known of the smaller forms, but menagerie records show that ages between twelve and twenty are frequently reached. There were in 1910 in the London Zoological Gardens, apparently in good health, a meerkat at least twelve years old, a sand-badger fourteen years and a ratel nineteen years of age. Records regarding monkeys are unsatisfactory, for these creatures are notoriously delicate in captivity, and it is practically certain that under such circumstances they rarely die of old age. A grey lemur eleven years old and a chimpanzee eleven and a half, both in good health in the London Zoological Gardens, appear to be the oldest primates definitely recorded. Estimates based on size, condition of the skull and so forth obtained by examination of wild specimens that have been killed would seem to establish a rough correspondence between the size of monkeys and their duration of life, and to set the limits as between seven or eight and thirty years.

With regard to the human race, there seems to be almost no doubt but that the average duration of life has increased with civilization; the generally improved conditions of life, the greater care of the young and of the aged and the advance in medical and surgical science far more than outweigh any depressing effect caused by the more strenuous and nervous activity required by modern social organization. The expectation of life of those who attain the age of sixty varies with race, sex and occupation, but is certainly increasing, and an increasing number of persons have a chance of reaching and do reach ages between ninety and one hundred. Careful investigation has thrown doubt almost amounting to disproof on the much-quoted cases of great longevity, such as that of Thomas Parr, the Shropshire peasant, who was supposed to have reached his hundred and fifty-third year, and, although the existence of centenarians is thoroughly established, any ages exceeding a hundred by more than two or three years are, at the most, dubious.

A survey of the facts of longevity, so far as these are established on reasonable evidence, discloses that the recorded ages both of men and animals are much shorter than those assigned in popular belief. The duration of life is usually brief in the animal kingdom, and except for some fish and reptiles, and possibly whales, it is certain that a man enjoys the longest average duration of life and that centenarians occur more frequently amongst men than amongst most of the lower animals.

Theories of Longevity.—Ray Lankester has pointed out that several meanings are attached to the word longevity. It may be used of an individual, and in this sense has little importance, partly because of the inevitable variability of the individual, and partly because there may be individuals that are abnormal in duration of life, just as there are abnormalities in weight or height. It may be used for the average duration of life of all the individuals of a species and so be another way of expressing the average mortality rate that affects the species, and that varies not only with structure and constitution but with the kind of enemies, accidents and conditions to which the members of the species are subject. If we reflect on the large incidence of mortality from external causes affecting a species and particularly the young of a species, we shall see that we must conclude that intrinsic, physiological causes can have relatively little weight in determining the average mortality rate. Finally, longevity may be used, and is most conveniently used, to denote the specific potential longevity, that is to say the duration of life that would be attained by normal individuals of a species if the conditions were most favourable. It is necessary to keep in mind these various applications of the term when considering the theoretical explanations that have been associated with the empirical facts.

There is a certain relation between size and longevity. As a general rule small animals do not live so long as larger creatures. Whales survive elephants, elephants live longer than camels, horses and deer, and these again than rabbits and mice. But the relation is not absolute; parrots, ravens and geese live longer than most mammals and than many larger birds. G. L. L. Buffon tried to find a more definite measure of longevity, and believed that it was given by the ratio between the whole period of life and the period of growth. He believed that the possible duration of life was six or seven times that of the period of growth. Man, he said, takes fourteen years to grow, and his duration of life is ninety to one hundred years; the horse has reached its full size at four years of age and may live for a total period of twenty-five to thirty years. M. J. P. Flourens attempted to make Buffon's suggestion more exact; he took the end of the period of growth as the time at which the epiphyses of the long bones united with the bones themselves, and on this basis held that the duration of life was five times the length of the period of growth. The theories of Buffon and Flourens, however, do not apply to all vertebrates and have no meaning in the case of invertebrates. Y. Bunge has suggested that in the case of mammals the period taken by the new-born young to double in weight is an index of the rapidity of growth and is in a definite relation to the possible duration of life. M. Armand has discussed the existence of definite relations between duration of life and size, rate of growth, period of gestation and so forth, and found so many exceptions that no general conclusion could be drawn. He finally suggested that diet was the chief factor in determining the span of life. E. Metchnikoff has provided the most recent and fullest criticism and theory of the physiological causes of longevity. He admits that many factors must be involved, as the results vary so much in different kinds of animals. He thinks that too little is known of the physiological processes of invertebrates to draw any valid conclusions in their case. With regard to vertebrates, he calls attention to the gradual reduction of longevity as the scale of life is ascended. On the whole, reptiles live much longer than birds, and birds than mammals, the contrast being specially notable when birds are compared with the larger mammals, and the difference of the reproductive tax from possible causes of short duration of life, for the obvious reason that longevity is nearly equal in the two sexes, although females have a much greater reproductive drain. He points out that the hind-gut or large intestine is least developed in fishes, relatively small in reptiles, still small but relatively larger in birds and largest in mammals, relatively and absolutely; the caecum or caeca being reckoned as part of the hind-gut. The area of the intestinal tract in question is of relatively little importance in digestion, although a considerable
amount of absorption may take place from it. It serves chiefly as a reservoir of waste matter and is usually the seat of extensive putrefactive changes that produce the putrefactive odors. The products of putrefaction are absorbed by the blood and there results a constant auto-intoxication of the body which Metchnikoff believes to be the principal agent in senile degeneration. Mammals, if they escape from enemies, diseases and accidents, fall victims to premature senility as the result of the putrefactive changes in their intestines, and the average mortality of the species is much too high, the normal specific longevity being rarely if ever attained. Metchnikoff urges, and so far probably is followed by all competent authorities, that improvements in the conditions of life, greater knowledge of disease and of hygiene and simplification of habits are tending to reduce the average mortality of man and the domestic animals, and to bring the average longevity nearer the specific longevity. He adds to this, however, a more special theory, which, although it appears rapidly to be gaining ground, is yet far from being accepted. The theory is that duration of life may be prolonged by measures directed against intestinal putrefaction.

The process of putrefaction takes place in masses of badly-digested food, and may be combated by careful dieting, avoidance of rich foods of all kinds and particularly of flesh and alcohol. Putrefaction, however, cannot take place except in the presence of a particular group of bacteria, the entrance of which to the body can be prevented to a certain extent. But it would be impossible or impracticable to secure a sterilized diet, and Metchnikoff urges that the bacteria of putrefaction can be replaced or suppressed by another set of microbes. He found that there was a widely spread popular belief in the advantage of diet consisting largely of products of soured milk and that there was a fair parallel between unusual longevity and such a diet. Experimentally he showed that the presence of the bacilli which produce lactic acid inhibited the process of putrefaction. Accordingly he recommends that the diet of human beings should include preparations of milk soured by cultures of selected lactic acid bacilli, or that the spores of such bacilli be taken along with food favorable to their development. In a short time the bacilli establish themselves in the large intestine and rapidly stop putrefactive change. The treatment has not yet been persisted in sufficiently long by a sufficient number of different persons to be accepted as universally satisfactory, and there is even more difference of opinion as to Metchnikoff’s theory that the chief agent in senile degeneration is the stimulation of phagocytes by the products of putrefaction with the resulting destruction of the specific cells of the tissues. Metchnikoff, however, gave it to the world, not as a proved and completed doctrine, but as the line of inquiry that he himself had found most promising. He has suggested further that if the normal specific longevity were attained by human beings, old and not degenerate individuals would lose the instinct for life and acquire an instinct for death, and that as they had fulfilled the normal cycle of life, they would accept death with the same relieved acquiescence that they now accept sleep.

The various writers whose opinions have been briefly discussed above are largely agreed that the principal factor of the normal specific longevity, although Metchnikoff alone has urged that this differs markedly from the average longevity, and has propounded a theory of the causes of the divergence. It is common ground that they believe the organism to be wound up, so to say, for a definite period, but have no very definite theory as to how this period is determined. A. Weismann, on the other hand, in a well-known essay on the duration of life, has developed a theory to explain the various fashions in which the gift of life is measured out to different kinds of creatures. He accepts the position that purely physiological conditions set a limit to the number of years that can be attained by each kind of multi-cellular organism, but holds that these conditions leave room for a considerable amount of variation. Duration of life, in fact, according to Weismann, is a character that can be influenced by the environment and that by a process of natural selection can be adapted to the conditions of existence of different species.

If a species is to maintain its existence or to increase, it is obvious that its members must be able to replace the losses caused by death. It is necessary, moreover, for the success of the species, that an average population of full vigour should be maintained. Weismann argues that death itself is an adaptation to secure the removal of useless and worn-out individuals and that it comes as soon as may be after the period of reproductive activity. It is understood that the term reproductive activity covers not merely the production of new individuals but the care of these by the parents until they are self-sufficient. The average longevity, according to Weismann, is adapted to the needs of the species; it is sufficiently long to secure that the requisite number of new individuals is produced and protected. He has brought together a large number of instances which show that there is a relation between duration of life and fertility. Birds of prey, which breed slowly, usually producing an annual brood of no more than one or two, live to great ages, whilst rabbits which produce large litters at frequent intervals have relatively short lives. Allowing to be made in cases where the young are largely preyed upon by enemies, for this counteracts the effect of high fecundity. In short, the duration of life is so adapted that a pair of individuals on the average succeed in rearing a pair of offspring. Metchnikoff, however, has pointed out that the longevity of such fecund creatures must have arisen independently, as otherwise species subject to high risks of this nature would have ceased to exist and would have disappeared, as many species have vanished in the past of the world’s history.

The normal specific longevity, the age to which all normal individuals of a species would survive under the most favourable conditions, must depend on constitution and structure. No doubt selection is involved, as it is obvious that creatures would perish if their constitution and structure were not such that they could live long enough to reproduce their kind. The direct explanation, however, must be sought for in size, complexity of structure, length of period of growth, capacity to withstand the wear and tear of life and such other intrinsic qualities.

The average specific longevity, on the other hand, depends on a multitude of extrinsic conditions operating on the intrinsic constitution; these extrinsic conditions are given by the environment of the species as it affects the young and the adults, enemies, diseases, abundance of food, climatic conditions and so forth. It would seem most natural to suppose that in all cases, except perhaps those of intelligent man and the domestic animals or plants he harbours, the average longevity must vary enormously with changing conditions, and must be a factor of greater importance in the survival of the species than the ideal normal specific longevity. It also seems more probable that the reproductive capacity, which is extremely variable, has been adapted to the average longevity of the species, than that, as Weismann supposed, it should itself be the determining cause of the duration of life.

LONGFELLOW, HENRY WADSWORTH

(1807-1882).

American poet, was born on the 27th of February 1807, at Portland, Maine. His ancestor, William Longfellow, had immigrated to Newbury, Massachusetts, in 1676, from Yorkshire, England. His father was Stephen Longfellow, a lawyer and United States congressman, and his mother, Zilpha Wadsworth, a descendant of John Alden and of “Priscilla, the Puritan maiden.”

Longfellow’s external life presents little that is of stirring interest. It is the life of a modest, deep-hearted gentleman, whose highest ambition was to be a perfect man, and, through sympathy and love, to help others to be the same. His boyhood was spent mostly in his native town, which he never ceased to
LONGFELLOW, HENRY WADSWORTH

love, and whose beautiful surroundings and quiet, pure life he has described in his poem “My Lost Youth.” Here he grew up in the midst of majestic peace, which was but once broken, and that by an event which made a deep impression on him—the War of 1812. He never forgot

“the sea-fight far away,
How it thundered o’er the tide,
And the dead captains as they lay
In their graves o’erlooking the tranquil bay,
Where they in battle died.”

The “tranquil bay” is Casco Bay, one of the most beautiful in the world, studied with bold, green islands, well fitted to be the Hesperides of a poet’s boyish dreams. At the age of fifteen Longfellow entered Bowdoin College at Brunswick, a town situated near the romantic falls of the Androscoggin river, about 23 m. from Portland, and in a region full of Indian scenery and legend. Here he had among his classfellows, Nathaniel Hawthorne, George B. Cheever and J. S. C. Abbott. During the latter years of his college life he contributed to the United States Literary Gazette some half-dozen poems, which are interesting for two reasons—(1) as showing the poet’s early, book-mediated sympathy with nature and legendary heroisms, and (2) as being almost entirely free from that supernatural view of nature which his subsequent residence in Europe imparted to him. He graduated in 1825, at the age of eighteen, with honours, among others that of writing the “class poem”—taking the fourth place in a class of thirty-eight. He then entered his father’s law office, without intending, however, it would appear, to devote himself to the study of the law. For this profession he was, both by capacity and tastes, utterly unfitted, and it was fortunate that, shortly after his graduation, he received an offer of a professorship of modern languages at Bowdoin College. In order to better qualify himself for this appointment, he went to Europe (May 13th, 1826) and spent three years and a half travelling in France, Italy, Spain, Germany, Holland and England, learning languages, for which he had unusual talent, and drinking in the spirit of the history and life of these countries. The effect of Longfellow’s visit was twofold. On the one hand, it widened his sympathies, gave him confidence in himself and supplied him with many poetical themes; on the other, it traditionalized his mind, coloured for him the pure light of nature and rendered him in some measure unfit to feel or express the spirit of American nature and life.

His sojourn in Europe fell exactly in the time when, in England, the reaction against the sentimental atheism of Shelley, the pagan sensitiveness of Keats, and the sublime, Satanic outcastness of Byron was at its height; when, in the Catholic countries, the negative exaggerations of the French Revolution were inducing a counter current of positive faith, which threw men into the arms of a half-sentimental, half-aesthetic medievalism; and when, in Germany, the aristrocratic paganism of Goethe was being swept aside by that tide of dutiful, romantic patriotism which flooded the country, as soon as it began to feel that it still existed after being run over by Napoleon’s war-chariot. He returned to America in 1829, and remained six years at Bowdoin College (1829-1835), during which he published various text-books for the study of modern languages. In his twenty-fourth year (1831) he married Miss Mary Story Potter, one of his “early loves.” In 1833 he made a series of translations from the Spanish, with an essay on the moral and devotional poetry of Spain, and these were incorporated in 1835 in Outre-mer: a Pilgrimage beyond the Sea.

In 1835 Longfellow was chosen to succeed George Ticknor as professor of modern languages and belles-lettres in Harvard. On receiving this appointment, he paid a second visit of some fifteen months to Europe, this time devoting special attention to the Scandinavian countries and Switzerland. During this visit he lost his wife, who died at Rotterdam, the 29th of November 1835.

On his return to America in December 1836, Longfellow took up his residence in Cambridge, and began to lecture at Harvard and to write. In his new home he found himself amid surroundings entirely congenial to him. Its spaciousness and free rural aspect, its old graveyards and towering elms, its great university, its cultivated society and its vicinity to humane, substantial, busy Boston, were all attractions for such a man. In 1837–1838 several essays of Longfellow’s appeared in the North American Review, and in 1839 he published Hyperion: a Romance, and his first volume of original poetry, entitled Voices of the Night. Hyperion, a poetical account of his travels, had, at the time of its publication, an immense popularity, due mainly to its sentimental romanticism. At present few persons beyond their teens would care to read it through, so unnatural and stilted is its language, so thin its material and so consciously mediated its sentiment. Neverthe less it has a certain historical importance, for two reasons—(1) because it marks that period in Longfellow’s career when, though he had left nature, he had not yet found art, and (2) because it opened the sluices through which the flood of German sentimental poetry flowed into the United States.

The Voices of the Night contains some of his best minor poems, e.g., “The Psalm of Life” and “Footsteps of Angels.” In 1842 Longfellow published a small volume of Ballads and Other Poems, containing some of his most popular pieces, e.g., “The Skeleton in Armour,” “The Wreck of the Hesperus,” “The Village Blacksmith,” “To a Child,” “The Bridge,” “Excelsior.” In the same year he paid a third brief visit to Europe, spending the summer on the Rhine. During his return-passage across the Atlantic he wrote his Poems on Slavery (1842), with a dedication to Channing. These poems went far to wake in the youth of New England a sense of the great national wrong, and to prepare them for that bitter struggle in which it was wiped out at the expense of the lives of so many of them. In 1843 he married again, his wife being Miss Frances Elizabeth Appleton of Boston, a daughter of Hon. Nathan Appleton, one of the founders of Lowell, and a sister of Thomas G. Appleton, himself no mean poet.

About the same time he bought, and fixed his residence in, the Craige House, where he had formerly only been a lodger, an old “revolutionary house,” built about the beginning of the 18th century, and occupied by General Washington in 1776. This quaint old wooden house, in the midst of a large garden full of splendid elms, continued to be his chief residence till the day of his death. Of the lectures on Dante which he delivered about this time, James Russell Lowell says: “These lectures, illustrated by admirable translations, are remembered with grateful pleasure by many who were thus led to learn the full significance of the great Christian poet.” Indeed, as a professor, Longfellow was eminently successful. Shortly after the Poems on Slavery, there appeared in 1843 a more ambitious work, The Spanish Student, a Play in Three Acts, a kind of sentimental “Morality,” without any special merit but good intention. If published nowadays it would hardly attract notice; but in those gushing, emotion-craving times it had considerable popularity, and helped to increase the poet’s now rapidly widening fame. A huge collection of translations of foreign poetry edited by him, and entitled The Poets and Poetry of Europe, appeared in 1845, and, in 1846, a few minor poems—songs and sonnets—under the title The Belfry of Bruges. In 1847 he published at Boston the greatest of all his works, Evangeline, a Tale of Acadie. It was, in some degree, an imitation of Goethe’s Hermann and Dorothea, and its plot, which was derived from Hawthorne’s American Note-Books, is even simpler than that of the German poem, not to say much more touching. At the violent removal by the British government of a colony of French settlers from Acadie (Nova Scotia) in 1755, a young couple, on the very day of their wedding, were separated and carried in different directions, so that they lost all trace of each other. The poem describes the wanderings of the bride in search of her lover, and her final discovery of him as an old man on his death-bed, in a public hospital which she had entered as a nurse. Slight as the story is, it is worked out into one of the most affecting poems in the language, and gives to literature one of its most perfect types of womanhood and of affection that hopes and endures and is patient. Though written in a metre deemed foreign
to English ears, the poem immediately attained a wide popularity, which it has never lost, and secured to the dactylic hexameter a recognized place among English metres.

In 1849 Longfellow published a novel of no great merit, *Kavanagh*, and also a volume of poems entitled *The Seaside and the Fireside*, a title which has reference to his two homes, the seaside one on the charming peninsula of Nahant, the fireside one in Cambridge. One of the poems in this collection, “Resignation,” has taken a permanent place in literature; another, “Hymn for my Brother’s Ordination,” shows plainly the nature of the poet’s Christianity. His brother, the Rev. Samuel Longfellow, was a minister of the Unitarian Church.

Longfellow’s genius, in its choice of subjects, always oscillated between America and Europe, between the colonial period of American history and the Middle and Romantic Ages of European feeling. When tired of the broad daylight of American activity, he sought refuge and rest in the dim twilight of medieval legend and German sentiment. In 1851 appeared *The Golden Legend*, a long lyric drama based upon Hartmann von Aue’s beautiful story of self-sacrifice, *Der arme Heinrich*. Next to *Evangeline*, this is at once the best and the most popular of the poet’s longer works, and contains many passages of great beauty. Bringing his imagination back to America, he next applied himself to the elaboration of an Indian legend. In 1854 he resigned his professorship. In the following year he gave to the world the Indian Edda, *The Song of Hiawatha*, a conscious imitation, both in subject and metre, of the Finnish epic, the *Kalevala*, with which he had become acquainted during his second visit to Europe. The metre is monotonous and easily ridiculed, but it suits the subject, and the poem is very popular. In 1858 appeared *The Courtship of Miles Standish*, a charming incident in the early history of the Plymouth colony, and, along with it, a number of minor poems, included under the modest title, *Birds of Passage*. One of these is “My Lost Youth.”

Two events now occurred which served to cast a gloom over the poet’s life and to interrupt his activity,—the outbreak of the Civil War, and the tragic fate of his wife, who, having accidentally allowed her dress to catch fire, was burnt to death in her own house in 1861. It was long before he recovered from the shock caused by this terrible event, and in his subsequent published poems he never ventured even to allude to it. When he did in some measure find himself again, he gave to the world his charming *Tales of a Wayside Inn* (1863), and in 1865 his *Household Poems*. Among the latter is a poem entitled “The Children’s Hour,” which is a picture of the home life of the widowed poet, who had been left with five children,—two sons, Ernest and Charles, and three daughters.

“A Grave Alice, and laughing Allegra,
And Edith with golden hair.”

A small volume entitled *Fleur de Luce* (1867) contains, among other fine things, the beautiful “threnos” on the burial of Hawthorne, and “The Bells of Lynn.” Once more the poet sought refuge in medieval life by completing his translation of the *Divina Commedia*, parts of which he had rendered into English as much as thirty years before. This work appeared in 1867, and gave a great impulse to the study of Dante in America. It is a masterpiece of literal translation. Next came the *New English Tragedies* (1868) and *The Divine Tragedy* (1871), which found no large public. In 1868–1869 the poet visited Europe, and was everywhere received with the greatest honour. In 1872 appeared *Three Books of Song*, containing translated as well as original pieces, in 1873 *Aftermath* and in 1875 *The Mask of Pandora* and other Poems. Among these “other poems” were “The Hanging of the Crane,” “Morituri Salutatus” and “A Book of Sonnets.” *The Mask of Pandora* is a proof of that growing appreciation of pagan naturalism which marked the poet’s later years. Though not a great poem, it is full of beautiful passages, many of which point to the riddle of life as yet unsolved, a conviction which grew ever more and more upon the poet, as the ebulliency of romanticism gave way to the calm of classic feeling. In the “Book of Sonnets” are some of the finest things he ever wrote, especially the five sonnets entitled “Three Friends of Mine.” These “three friends” were Cornelius Felix, Louis Agassiz and Charles Sumner, whom he calls “The noble three.”

Who had my life were more friends to me.

The loss of Agassiz was a blow from which he never entirely recovered; and, when Sumner also left him, he wrote:—

“Thus hast thou left me but Tom and Gid gone to bed;

I stay a little longer, as one stays

To cover up the embers that still burn.”

He did stay a little longer; but the embers that still burnt in him refused to be covered up. He would fain have ceased writing, and used to say, “It’s a great thing to know when to stop”; but he could not stop, and did not stop, till the last. He continued to publish from time to time, in the magazines, poems which showed a clearness of vision and a perfection of workmanship such as he never had equaled at any period of his life. Indeed it may be said that his finest poems were his last. Of these a small collection appeared under the title of *Keramos, and Other Poems* (1878). Besides these, in the years 1875–1878 he edited a collection of *Poems of Places* in thirty-one small volumes. In 1880 appeared *Ultima Thule*, meant to be his last work, and it was nearly so. In October 1881 he wrote a touching sonnet on the death of President Garfield, and in January 1882, when the hand of death was already upon him, his poem, *Hermes Trismegistus*, in which he gives utterance, in language as rich as that of the early gods, to that strange feeling of awe without fear, and hope without form, with which every man of spotless life and upright intellect withdraws from the phenomena of time to the realities of eternity.

In the last years of his life he suffered a great deal from rheumatism, and was, as he sometimes cheerfully said, “never free from pain.” Still he remained as sunny and genial as ever, looking from his Cambridge study windows across the Brighton meadows to the Brookline hills, or enjoying the “free wild winds of the Atlantic,” and listening to “The Bells of Lynn” in his Nahant home. He still continued to receive all visitors, and to take occasional runs up to Castine and Portland, the homes of his family. About the beginning of 1882, however, a serious change took place in his condition. Dizziness and want of strength confined him to his room for some time, and, although after some weeks he partially recovered, his elasticity and powers were gone. On the 19th of March he was seized with what proved to be peritonitis, and he died on the 24th. The poet was buried two days afterwards near his “three friends” in Mount Auburn cemetery. The regret for his loss was universal; for no modern man was ever better loved or better deserved to be loved.

Longfellow was made an LL.D. of Bowdoin College in 1858, at the age of twenty-one, of Harvard in 1859 and of Cambridge (England) in 1868, and D.C.L. of Oxford in 1869. In 1873 he was elected a member of the Russian Academy of Science, and in 1877 of the Spanish Academy.

In person, Longfellow was rather below middle height, broad shouldered and well built. His head and face were extremely handsome, his forehead broad and high, his eyes full of clear, warming fire, his nose straight and graceful, his chin and lips rich and full of feeling as those of the Praxitelean Hermes, and his voice low, melodious and full of tender cadences. His hair, originally dark, became, in his later years, silvery white, and its wavy locks combined with those of his flowing beard to give him that leonine appearance so familiar through his later portraits. Charles Kingsley said of Longfellow’s face that it was the most beautiful human face he had ever seen. A bust to his memory was erected in the Poet’s Corner in Westminster Abbey in 1884.

In Longfellow, the poet was the flower and fruit of the man. His nature was essentially poetic, and his life the greatest of his poems. Those who knew only the poems he wrote could form but a faint notion of the harmony, the sweetness, the manliness and the tenderness of that which he lived. What he would have been as a poet, if, instead of visiting Europe in early life and drinking in the spirit of the middle ages under the shadows of cathedral towers, he had, like
Whittier, grown old amid American scenery and life, we can only guess from his earlier poems, which are as naturalistic, fresh and unmythical as could be desired; but certain it is that, from his long familiarity with the medieval view of nature, and its semi-pagan offspring, he was able to throw off the accretions of years, and live as a poet, to look upon the world of men and things either as the middle scene of a miracle play, with a heaven of rewarding happiness above and a purgatory of purifying pain below, or else as a garment concealing, but not concealing from his eye, the spiritual splendour of life. During this time he could hear "the trailing garments of the night sweep through her marble halls," and see "the stars come out to listen to the music of the seas." Later on, as he approached his second youth, he was able to see a second childhood, and himself his life, as if he were a child, opening out the world of thought and the semi-pagan view. About the time when he was writing The Mask of Pandora, he could see "in the sunset Jason's fleece of gold," and hear "the waves of the distracted sea piteously calling and lamenting his lost maid."

Whittier was a pagan, a

Longfellow's poetry is for the most part, aspects of nature as influencing human feeling, either directly or through history, the individual's personal way of life, or heroic deeds preserved in legend or history. He had a special fondness for records of human devotion and self-sacrifice, whether they were monastic legends, Indian tales, Norse dendrochronology or bits of American history. Whether the records were of the real or the fictitious, of the past or the present, or of the deep past of the world, was essentially religious and subjective, and, consequently, his manner of dealing with it was hymnal or lyric. This fact, even more than his merits as an artist, serves to account for his immense popularity. Too much is said, to our advantage and too much coming from the veil of the "grand old masters," or one of these "stars that come in sight once in a century," he made it his aim to write something that 

He had no sympathy with either secticism or formal dogmatism, and no need to hazard rash guesses respecting man's destiny. He disliked the psychological school of art, believing it to be essentially morbid and unhealthy. He had no sympathy with "an attitude that views the world as a miracle, or as a charade, or as a dream," and so 

If we look in Longfellow's poetry for originality of thought, profound psychological analysis or new insights into nature, we shall be disappointed. Though very far from being hampered by any dogma, he was yet a religious poet, and the religious past, until near the end, found sufficient satisfaction in the Christian view of life to make it indifferent to the restless, inquiring spirit of the present, and inclined to play with any new current suggestion of life. He never wholly abandoned the originality of the pagan, and many of the minor poems; they are all subjective. This is not the highest praise that can be given to works of art: but it implies less displace in Longfellow's case than in almost any other, by men of greater activity.

The population (52,647 in 1891; 46,672 in 1901) decreases seriously, owing to emigration. About 90% of the total are Roman Catholics. The only towns of any importance are Longford (the county town, pop. 3747) and Granard (1622). The county includes six baronies. Anseis is held at Longford, and Ballymahon and Edgeworth at Granard and Longford. The county is in the Protestant diocese of Ardagh, and the Roman Catholic dioceses of Ardagh and Meath. It is divided into two parliamentary divisions, north and south, each returning one member.

The early name of Longford was Annaly or Analé, and it was a principality of the O’Farrells. Along with the province of Meath, in which it was then included, it was granted by Henry II. to Hugh de Lacy, who planted an English colony. On the division of Meath into two counties in 1534, Annaly was included in Westmeath, but under a statute of 1559, for the shiring of countries not already shired, it was made shire ground, and thus entered in the name of Longford.

Among antiquities, the chief ruin is the rath called the Moat of Granard, at the end of the main street of that town. There are monastic remains at Ardagh, a former bishopric, Longford, Moydow, and on several of the islands of Lough Ree. The principal old castles are those of Rathcline near Lanesborough, and Ballymahon on the Inn. The principal modern seats are those of Carrickglass on the Camlin, and Castle Forbes, the seat of the earls of Granard. Oliver Goldsmith was born at Pallas, a village near Ballymahon, in this county; and at Edgeworthstown the family of Edgeworth, of which the famous novelist Maria Edgeworth was a member, established themselves in the 18th century.

LONGFORD, the county town of Co. Longford, Ireland, on the river Camlin, and on a branch of the Midland Great Western railway, 75 m. W.N.W. of Dublin. Pop. (1901) 3747. The principal building is St Mel’s Roman Catholic cathedral for the diocese of Ardagh, one of the finest Roman Catholic churches in Ireland. The town has a considerable trade in grain, butter and bacon. There are corn-mills, a soap factory and tanneries. Longford is governed by an urban district council. The ancient name of the town was Athfada, and here a monastery is said to have been founded by St Idus, a disciple of St Patrick. The town obtained a fair and market from James I. and a charter of incorporation from Charles II., as well as the right to return two members to Parliament. It was disfranchised at the Union in 1800.

LONGHI, PIETRO (1702-1752), Venetian painter, was born in Venice. He was a pupil of Antonio Paeatra and Giuseppe Maria Crespi at Bologna, and devoted himself to the painting of the elegance of the social life in 18th-century Venice. The republic was dying fast, but her sons, even in this period of political decline, retained their love of pageants and ceremonies and of extravagant splendour in attire. The art of Venice was vanishing like her political power; and the only painters who attempted to stem the tide of artistic decadence were the Canaletto, Guardi, Tiepolo and Longhi. But whilst the Canaletti and Guardi dwelt upon the architectural glories of Venice, and Tiepolo applied himself to decorative schemes in which he continued the tradition of Paolo Veronese and Tintoretto, Longhi became the chronicler of the life of his countrymen. In a way his art may be set beside Hogarth’s, though the Venetian did not play the part of a satirical moralist. He has aptly been called the Goldoni of painting. His subject is that of light social comedy—the life at the café, the hairdresser’s, at the dancing-school, at the dressmaker’s. The tragic, or even the serious, note is hardly sounded in his work, which, in its colour, is generally distinguished by a rich mellow quality of tone. Most of his paintings are in the public and private collections of Venice. They are generally on a small scale, but the staircase of the Palazzo Grassi in Venice is decorated by him with seven frescoes, representing scenes of fashionable life. At the Venice academy are a number of his genre pictures and a portrait of the architect Temanza; at the Palazzo Quirini-Stampa the portrait of the Duchess of Daniele Dolfini, “The Seven Sacraments” (etched by Pitteri), a “Temptation of St Anthony,” a “Circus,” a “Gambling Scene,” and several other genre pictures and portraits; at the Museo Correr a dozen scenes of Venetian life and a portrait of Goldoni. In England the National Gallery owns “The Exhibition of a Rise Longinus,” “On a Arena,” a “Domestic Group,” “The Fortune-Teller,” and the portrait of the Chevalier Andrè Tron; two genre pictures are at Hampton Court Palace, and others in the Richter and Mond collections. Many of his works have been engraved by Alessandro Longhi, Bartolozzi, Cattini, Faldoni and others. Longhi died in Venice in 1762.

LONGINUS, CASSIUS (c. A.D. 213–273), Greek rhetorician and philosophical critic, surnamed PHILOLOGUS. The origin of his gentle name Cassius is unknown; it can only be conjectured that he adopted it from a Roman patron. He was possibly a native of Emesa (Homs) in Syria, the birthplace of his uncle Fronto the rhetorician. He studied at Alexandria under Origen the heathen, and taught for thirty years at Athens, one of his pupils being the Neoplatonist Porphyry. Longinus did not embrace the new speculations then being developed by Plotinus, but continued a Platonist of the old type. He upheld, in opposition to Plotinus, the doctrine that the Platonic ideas existed outside the divine Nous (or ἐκ τοῦ νοῦ ὕποκάτω τοῦ νοῦ: see F. Ueber, Grundriss der Geschichte der Philosophie, 9th ed., 1903, i. § 72) Plotinus in teaching his treatise Ἑνίστ. (On First Principles), remarked that Longinus tried to be a scholarch (Φιλολόγος), but that he was no philosopher (Φιλόσοφος). The reputation which Longinus acquired by his learning was immense; he is described by Porphyry as “a public teacher,” and by Eunapius as “a living library and a walking museum” or encyclopaedia. During a visit to the East he became teacher in Greek, and subsequently chief counsellor in state affairs, to Zenobia, queen of Palmyra. It was by his advice that she endeavoured to regain her independence; Aurelian, however, crushed the attempt, and while Zenobia was led captive to Rome to grace Aurelian’s triumph, Longinus paid the forfeit of his life.

Longinus was the author of a large number of works, nearly all of which have perished. Among those mentioned by Suidas are Questiones Homericae, An Homerus fuerit philosophus, Problematum Homeri et solutiones, Aticorum vocabularium editione dedicato, the most important of his philosophical works, Philologou (Philological Discourses) consisting of at least 21 books, is omitted. A considerable fragment of the Εἰσίν οὖν (De finibus, On the Chief End) is preserved in the Life of Plotinus by Porphyry (§ 20). Under his name there is an extant Prolegomena to the Encheiridion of Hephaestion on Homer (printed in R. Westphal, SCRIPTORES METRICI GRAICI, i. 1866) and the fragment of a treatise on rhetoric (L. Spengel, RHETORES GRACII, i. pp. 299-320), inserted in the middle of a similar treatise by Apsines. It gives brief practical hints on invention, arrangement, style, memory and other things useful to the student. Some important excerpts from the Λόγια Λογισμον (Spengel, i. 325-328) possibly from his the Φιλολογος ἄμβλα. It is as the reputed author of the well-known and remarkable work Παραμορφος (generally, but inadequately, rendered On the Sublime) that Longinus is best known. Modern scholars, however, with few exceptions, are agreed that it cannot with any certainty be ascribed to him, and that the question of authorship cannot be determined (see Introduction to Robert’s edition). The following are the chief arguments against Longinus as the author. (1) This treatise is not mentioned by any classical author, nor in any lists of the works written in his name. (2) The evidence of the MSS. shows that doubts existed even in early times. In the most important (No. 2036) in the Paris Library, 17th century, the headdesk is blank, thus giving an alternative author Dionysius; in the Laurentian MS. at Florence the title has Λογισμον, implying that the author was unknown. The ascription in the Paris MS. led to the addition of Dionysius to the name of the reputed author—Cassius Longinus, accounted for by the supposition that his early name was Cassius being subsequently adopted from a Roman patron whose client he had been. (3) The absence of any reference to the famous writers on rhetoric of the age of the Antonines, such as Hermogenes and Alexander son of the Athenians, the supposed author of On the Παραμορφος was written with a view of correcting the faults of style and method in a treatise by Caecilius (p.p.) of Calacte on the same subject. As Caecilius flourished during the reign of Augustus, it is hardly likely that his work would have been selected for purposes of criticism in the 3rd century. (5) General considerations of style and language and of the point of view from which the work is written. In favour of Longinus: (1) The traditional ascription, which held its ground
LONG ISLAND

unchallenged till the beginning of the 18th century. (2) The philosophical colouring of the first chapter and the numerous quotations from Plato are in accordance with what is known of his philosophical opinions. (3) The treatise is the kind of work to be expected from one who was styled, "the first of critics." (4) The Dionysius referred to (xiii. 3) is supposed to be Ammonius Saccas (c. 175-242), but it appears from the Venetian scholia to the Iliad that there was an earlier Ammonius (c. 140 B.C.), a pupil and successor of Aristarchus of Alexandria, who, judging from the context, is no doubt the writer in question. The reference is therefore an argument against Longinus.

The work is dedicated to a certain Terentianus, of whom nothing is known (see Rohde, C. X., 18).

The alternative author Dionysius of the MSS. has been variously identified with the rhetorician and historian Dionysius of Halicarnassus, the Attic Aelius Dionysius of Halicarnassus, Dionysius Atticus, and various others. Dionysius reports as claimants to the authorship are Plutarch (L. Vauquer in Études critiques sur le traité du sublime (Geneva, 1854) and Aelius Theon of Alexandria (W. Christ), the author of a work on the Arrangement of Speech. But it seems most probable that the author was an unknown writer who flourished in the 1st century soon after Caecilius of Hermogenes. Willamowitz-Möllendorff gives his date as A.D. 40.

The rendering On the Sublime implies more that is intended by the Greek word ὑπόθεσις ("impressive style," etc.). Nothing abnormal, such as is associated with the word "sublime," is the subject of discussion; it is rather a treatise on style. According to the author's own definitions, "Sublimity is a certain distinction and excellence of thought and expression. Sublimity consists in expression, "sublimity is the echo (or expression) of a great soul" (see note in Roberts).

The treatise is especially valuable for the numerous quotations from classical authors, all of which, for the preservation of the famous fragment of Sappho, the ode to Anactoria, beginning ἐπεταλαζέται πανεπός ἐν βουκέοιν, initiated by Catullus (I. 4) Ad Lebiam, "Il mi par esse deo videtur."

"Its main object is to point out the essential elements of an impressive style which, avoiding all turgidity, puerility, affectation and affectation and futility, leads to grandeur of thought and intensity of feeling, and its expression in nobility of diction and in skillfully ordered composition" (Sandys).

A full bibliography of the subject will be found in the edition by W. R. Roberts (Cambridge, 2nd ed., 1907), containing an Introduction, Analysis, Transition and Appendices (textual, linguistic, literary and bibliographical), to which may be added F. Marx, Wiener Studien, xx. (1898), and F. Kabel, Hermes, xxv. (1899), who respectively advocate and reject the claim of Longinus to the authorship of the work. "Dionysius of Halicarnassus" and "ancient its undoubted author," pp. 288, 338, should also be consulted. The number of translations in all the languages of Europe is large, including the famous one by Boileau, which made the work a favourite text-book of the helle.

The text and translation was published by A. O. Prickard (1907-1908).

LONG ISLAND, an island, 118 m. long and 12 to 23 m. wide, with its axis E.N.E. and W.S.W., roughly parallel with the S. shore of Connecticut, U.S.A., from which it is separated by Long Island Sound (115 m. long and 20-25 m. wide) and lying S.E. of the mainland of New York state, of which it is a part, and immediately E. of Manhattan Island. Area, 1682 sq. m. The east end is divided into two narrow peninsulas (the northern culminating in Orient Point about 25 m. long, the southern ending in Montauk Point, the eastern extremity of the island, about 40 m. long) by the three bays, Great Peconic, Little Peconic (in which lies Shelter Island) and Gardiners (in which lies Gardiners Island). The N. shore is broken in its western half by the Shirley and Fluetschs Flats; the Long Island, Barclays Bay, Cold Spring Harbor, Huntington Bay (nearly landlocked), Smithtown Bay and Port Jefferson Harbor, which also is nearly landlocked. East of Port Jefferson the N. shore is comparatively unbroken. The S. shore has two bays, Jamaica Bay with many low islands and nearly cut off from the ocean by the narrow spur of Rockaway Beach; and the ill-defined Great South Bay, which is separated from the Atlantic by the narrow Long Beach, Jones Beach and Oak Island Beach, and by the long peninsula (35 or 40 m.), called Fire Island or Great South Beach. Still farther E. and immediately S. of Great Peconic Bay is Shinnecock Bay, about 10 m. long and cut off from the ocean by a narrow beach.

The N. side of the island was largely built by deposits along the front of the continental glacier, and its peculiar surface is due to such deposits. At Astoria the dark gneiss bed rock is visible. The S. half of the island is mostly built of a light sandy or loamy soil and is low, except for the hills (140-195 ft.) of Montauk peninsula, which are a part of the "back-bone" of the island elsewhere remaining through the Pleistocene, and the "beach" of the 11th to 12th centuries. From the extreme, Oakview's High Hill (384 ft.) and Hempstead Hill, W., of which are the flat and fertile Hempstead Plains. North of the back-bone or central ridge the country is hilly with glacial drift and in the central part there are many small fertile plains. The S. side of the "back-bone" is that of the "South Side." There is good clay at Whitestone and at Lloyd's Point on the north side. This north shore is comparatively well wooded; the middle of the island is covered with stunted oaks and maples. The oaks sometimes reach a height of 40 ft.

The rendering Island is a meeting-place for equatorial and arctic species of birds and fish; in winter it is visited occasionally by whales and other Arctic species. E. DeKay in his botanical and zoological survey (1842-1849) of New York state estimated that on Long Island there were representatives of two-thirds of the species of land birds of the United States. The Long Island Surf is one of the largest and best-known of the "surf tides" in America. It is estimated that there are snipe and duck shooting, especially on the shores of the Great South Bay; there is good deer hunting, especially in Islip town; and there are many fishing grounds for all kinds of fish, but especially for game-fish, such as cod, mackerel, and flounder, within 50 m. of New York City. There are many excellent trout streams and the island was known in aboriginal times for its fresh and salt water fish. Indian names referring to fishing places are common in Long Island. Boreas (Ambrose Bierce's "Some Initials Upon a Long Island") was the name of a New York State Fish Commission has a hatchery at Cold Spring Harbor on the N. shore. The largest commercial fisheries are on the south side, in the ocean. The Long Island Sound is a fine place for boating. Long Island is the home of the famous "South Shore," in which captured fish are kept alive before shipment to market. Sag Harbor and East Hampton on the E. end of the island were important whaling ports in the 18th century and the first part of the 19th, and they and other fishing villages afterward did a large business in the capture of menhaden (Brevortia melas), a small edible fish, which, following the custom of the Indians, they manufactured into fertilizer. At Glen Cove there are now great starch factories.

The west end of the island has been called New York's market garden. On Long Island there are many large farms and immediately E. of them along the north shore great quantities of cabbage and cucumbers are grown and manufactured into saucerkraut and pickles. There are large cranberry fields near the village of Calverton, immediately N. of Great South Bay.

There are a few large farms on Long Island, mostly on the north side, but it is becoming more and more a place of suburban residence. This change is due in part to cool summer and warm winter winds from the ocean, which makes the July mean temperature 68° to 70° F. at the east end and the south side, and 72° on the north shore, as contrasted with 74° for the west end and New York City. The range of temperature is said to be less than in any other place in the United States with the exception of Corpus Christi (Tex.), Eureka (California), Galveston (Texas), and Key West (Florida). Even on the south shore the humidity for August and September is less than that of any location on the Atlantic coast, as Los Angeles and San Diego on the Pacific, according to Dr Le Grand N. Denslow in a paper, "The Climate of Long Island" (1901). Surf-bathing on the south shore, 3

G. K. Gilbert, in an article, "The Deflection of Streams" in the American Journal of Science (xxvii. 427-432), points out that each of these streams is "bounded on the west or right side by a bluff 10 to 20 ft. high."
LONG ISLAND

yachting and boating on the Sound, the Great South Bay and the Ocean, and hunting and fishing are attractions. At Garden City, Nassau (Glen Cove), Great River and Shinnecock Hills are well-known golf links; there are several hunt clubs; and at Southampton are some of the best turf tennis-courts in the United States. Few parts of the island are summer resorts in the ordinary use of the word; there are large hotels hardly anywhere save on Coney Island, at Far Rockaway, on Long Beach and on Shelter Island; and a large part of the summer population lives in private mansions. Some Long Island "country places" are huge estates with game and fish preserves and luxurious "châteaux." The roads are good. The course of the Vanderbilt automobile races is along the roads of the Hempstead Plains. Also on the Hempstead Plains are the Creedmoor Rifle Range, where, in an Interstate Park, E. of Jamaica, annual international rifle shooting tournaments for the championship of America were held until 1909; Garden City, which was founded by A.T. Stewart for the purpose of providing comfortable homes at low cost to his employees and others, and where are the Protestant Episcopal Cathedral of the Incarnation, St. Paul's School for Boys and St. Mary's School for Girls; and, near Hempstead, the grounds of the Meadowbrook (hunt and polo) Club and those of the Farm Kennel Club. The only railway is the Long Island Railroad (owned by the Pennsylvania Railroad) with western termini on Manhattan and in Long Island City and Brooklyn, whence lines meet at Jamaica, and thence three principal lines branch, the north shore to Wading River, the main line to Greenport, and the south side to Montauk.

Long Island is a part of New York State, its western third forming Brooklyn and Queens boroughs of New York City—these boroughs were formed respectively from Kings county and from the W. half of Queens county on the erection of Greater New York. What was formerly the E. half of Queens county then became Nassau county (area 252 sq. m.; pop., in 1900, 35,548; in 1905, 69,477), whose county-seat is Mineola. The townships of the larger part of the island is the less thickly settled Suffolk county with an area of 918 sq. m. and a population in 1900 of 77,582 and in 1905 of 81,653. The county-seat of Suffolk county is Riverhead, so named from its position at the head of the Peconic river on the W. end of Great Peconic Bay. The ten townships of Suffolk county are large governmental units, showing, by their similarity to the towns of New England, the relation of the early settlers to the towns of New England. The largest in area is Brookhaven, which reaches all the way across the island near its central part. The townships of Suffolk county with their population in 1905 were: Huntington (10,236), Babylon (7,910), Smithtown (3,325), Islip (13,721), Brookhaven (16,050), Riverhead (4,502), Shelter Island (1,105), Easthampton (4,403), Southold (8,589) and Southampton (11,024). The total population of Long Island was 1,423,221 in 1800, and 1,718,936 in 1905 (state census), the population of the borough of Brooklyn alone for these years being 1,166,582 and 1,358,086.

History—The first settlers on Long Island at the time of the first settlement by the whites were the Montauk, on the eastern end of the island, where they gave their name to the "point" and where their last "king," David Pharaoh, died in 1653; the Shinnecock, who, much addicted with negro blood, now live on the reservation between Canoe Place and Shinnecock Hills; the Manhasset, on what is now Shelter Island; the Patchogue, near the present village of that name; the Massapequa, between the Hempstead Plains and what is now Islip, who were defeated and practically exterminated in 1653 by John Underhill; the Canarsie, who lived near the present Jamaica; and on the north side the Nesaquague or Nissequogue (in the present town of Smithtown), and the Seauncoc who gave their name to Setauket in Brookhaven town. The first pastor of the church (Presbyterian-Congregational) at Easthampton, Thomas James (c. 1620—1666), is supposed to have translated a catechism and parts of the Bible into the dialect of the Montauk, among whom Samson Occum had a school between 1755 and 1765.

The territory of Long Island was included in the grant of 1620 by James I. to the Plymouth Company and in 1635 was conveyed to William Alexander, earl of Stirling. The conflicting claims of English and Dutch were the subject of the treaty concluded at Hartford, Connecticut, in 1650, by which the Dutch were to hold everything west of Oyster Bay, the English everything east—a provision which accomplished no agreement, since Oyster Bay itself was the matter of contention, and English settlers on what the Dutch called the west side of Oyster Bay refused to remove. Long Island was included in the territory assigned to the duke of York in 1663—1664, when the New England towns on the island objected to separation from Connecticut. On the recovery of New York by the Dutch in 1673 the eastern towns refused to submit to the Dutch governor. In 1674 by the treaty of Westminster Long Island became a part of the British colony of New York. The Dutch settlements were more important ethnically than historically; on the west end of the Island the Dutch Reformed Church is still strong and there are many Dutch names; at West Sayville, on the "south side," almost 120 m. from New York, in a settlement made about 1786 by Gustav Tukker, who did much to develop the oyster fisheries, Holland Dutch was the common speech until the last quarter of the 19th century. The "Five Dutch Towns" were: Nieuw Amersfoord (after 1803 officially called Flatlands), on Jamaica Bay, where the first settlement was made about 1623 and the first grant in 1636; Midwout (later Vlacke-Bosch and Flatbush), settled between 1643 and 1650 and having in 1654 the first Dutch church; Nieuw Utrecht, settled soon after 1650 and incorporated in 1660; Breuckelen (now Brooklyn), which was settled a little before its organization as a town in 1646; and Boswijck (Bushwick), first settled by Swedes and Norwegians and incorporated in 1660. These five towns became one administrative district in 1665.

Apparently the earliest English settlement was at Hempstead in 1640 by colonists from Lynn, Massachusetts, who based their claim on the patent (1629) of Nova Scotia to Robert Stirling, but were almost immediately driven out by the Dutch. In 1643 another English settlement was made at Hempstead by men from Stamford, Connecticut, who in 1644 secured a patent from Governor Kieft of New Netherland. In 1645 Kieft granted land at Gravesend to Lady Deborah Moody, who had settled there about 1643, when she had left Lynn and the Salem church because of her anti-pedobaptist views. At Gravesend in 1646 Colonel Richard Nicolls first landed the English troops which occupied the island; and in 1643 it became one of its three ports of entry. The Connecticut towns on Long Island were as follows: Southampton was settled in 1640 by the Lynn men driven out of Hempstead by the Dutch, and in 1644-1664 was in the Connecticut jurisdiction. Southold (the "South Hold of New Haven"), called from 1640 until 1644 by the Indian name Yennicock, had a church in 1649, and a court based on the Levitical law, which was abolished in 1643 upon the remonstrance of the authorities of New Haven. The Southold settlers were from Hingham, Norfolk and New Haven, and the colony joined New Haven in 1648, in which year the colony of Forrett's (now Shelter) Island also submitted to New Haven. Easthampton was settled in 1648 from Lynn. Oyster Bay was also settled by Lynn men in 1640 and contested by the Dutch and English. Newtown, officially called Middleburgh, was settled in 1652, purchased from the Indians in 1656, "annexed to the other side of the Sound" in 1662, in the same year took the name of Hastings, in 1706 was the scene of the arrest of the Presbyterian itinerants Francis Mackenzie and John Hampton, and in 1766 was the site of the Methodist Episcopal Society at Middle Village, the second oldest of that denomination in America. Huntington was settled in 1653 from New Haven, Hempstead, Southold and Southampton. Other early settlements were: Jamaica, about 1657; Brookhaven, first settled at Ashford (now Setauket) from Boston in 1655, and Smithtown, patented in 1677 to Richard Smith of Setauket, who was said to be a soldier of Cromwell, and of whom there is a story that having bargained with the Indians for as much land as a bull could cover in a day he rode his trained bull in a great circuit about the land he coveted and
was thereafter known as “Bull” Smith. Almost all these English settlements were made by Presbyterians and from Jamaica east this was the prevailing denomination. During the War of Independence the battle of Long Island (see below) was fought within what is now the borough of Brooklyn.

Prime, _History of Long Island_ (New York, 1845), especially valuable for ecclesiastical history, particularly of the Presbyterian church; Martha B. Flint, _Early Long Island_ (1896); George Turner, _Long Island_ (New York, 1875), edited by Frank Moore; and the publications of the Long Island Historical Society (of Brooklyn) and of the Suffolk County Historical Society (of Riverhead). (R. We.)

_Battle of Long Island, 1776._—The interest of this battle lies in the fact that it was the first engagement in the campaign of 1776 (see _American War of Independence_) and was expected in England to be decisive of the contest in the colonies. After the evacuation of Boston (March 1776) Lord Howe undertook the attack against New York City, which he thought would afford a better base of operations for the future. The Americans undertook its defence although recognizing the difficulties in the case, as the bay and rivers adjoining would enable the British fleet to co-operate effectively with the army. To protect his left flank Washington was forced to throw a portion of his troops over to the Long Island side of the East river; they fortified themselves there on the site of the present Borough of Brooklyn. Lord Howe, who had encamped on Staten Island at the entrance to the harbour, determined to attack this isolated left wing, and on the 22nd of August landed at Gravesend Bay, Long Island, with about 20,000 men. The Americans maintained strong outposts in the wooded hills in advance of their fortified lines. On the morning of the 27th Howe, after four days' reconnaissance, attacked these posts with three columns, the left and centre delivering the holding attack, and the right and strongest column turning the enemy's left by a détour. Howe himself, accompanied by Generals (Sir H.) Clinton and Lord Cornwallis, led the turning movement, which came upon the rear of the enemy at the moment when they were engaged with the two other columns. By noon the Americans had been driven back into the Brooklyn lines in considerable confusion, and with the loss of about half their number. This constituted the battle. The completeness of the English victory was due to the neglect of the Americans in guarding the left of their outposts. Howe has been criticized for not immediately assaulting the American works which he might have carried on the evening of the battle. In view of the fact that he had only defeated a small portion of the American forces, and that the works were of considerable strength, he decided to make a formal siege, and Washington took advantage of the delay in operations to retreat across the river to New York on the night of the 29th. This successful movement repaired to some extent the bad moral effect of the defeat of the 27th in the American camp. In the engagement of Long Island Washington lost about 1200 prisoners and 30 guns, and 400 killed and wounded; of the latter the British lost nearly the same number. (C. F. A.)

LONG ISLAND CITY, formerly a city of Queens county, New York, U.S.A., and since the 1st of January 1808 the first ward of the Borough of Queens, New York City. Pop. (1880) 17,129, (1890) 30,506, (1900) 48,272, of whom 15,809 were foreign-born. It has a river front, on East river and Long Island Sound, of 10 m., and is the eastern terminal and the headquarters of the Long Island railway, having a large Y.M.C.A. building (the gift of Mrs Russell Sage) for employees of this railway. Among manufactures are chemicals, pottery, varnish, silk, &c., and there are oil-storage warehouses. Most of the borough offices of Queens county are in Long Island City, which was formerly the county-seat of Queens county. The first settlement within the limits of what subsequently became Long Island City was made in 1640 by a Dutch blacksmith, Hendrick Harmensen, who soon afterward was murdered by an Indian. Other settlers, both Dutch and English, soon followed, and established detached villages, which became known as Hunter's Point, Blissville, Astoria, Ravenswood, Dutch Kills, Middleton and Steinway.

In 1853 this group of villages, by that time virtually one community, was called Long Island City, and it was formally incorporated under that name in 1875. In 1871-1872 the city was laid out by a commission of which General W. B. Franklin was president. Political convictions, economic considerations and fear combined to make the residents in this region largely loyalist in their attitude during the War of Independence. From 1776 to 1783 British troops occupied Newtown, a village to the S.E. In January 1776 the committee on the state of New York in Congress reported a resolution that "Whereas a majority of the inhabitants of Queens county, in the colony of New York, being incapable of resolving to live and die free men, . . . all such persons as voted against sending deputies to the present convention in New York . . . be put out of the protection of the United Colonies," &c., an action which led to the arrest and imprisonment of many of the accused persons.

See J. S. Kelsey, _History of Long Island City_ (Long Island City, 1896).

LONGITUDE (from Lat. _longitude_, “length”), the angle which the terrestrial meridian from the pole through a point on the earth's surface makes with some standard meridian, commonly that of Greenwich. It is equal to the difference between local time on the standard meridian, and at the place defined, one hour of time corresponding to 15° difference of longitude. Formerly each nation took its own capital or principal observatory as the standard meridian from which longitudes were measured. Another system had a meridian passing through or near the island of Ferro, defined as 20° W. of Paris, as the standard. While the system of counting from the capital of the country is still used for local purposes, the tendency in recent years is to use the meridian of Greenwich for nautical and international purposes. France, however, uses the meridian of the Paris observatory as its standard for all nautical and astronomical purposes (see T. L. J.). In astronomy, the longitude of a celestial body is the distance of its projection upon the ecliptic from the vernal equinox, counted in the direction west to east from 0° to 360°.

LONGLEY, CHARLES THOMAS (1794–1868), archbishop of Canterbury, was born at Rochester, and educated at Westminster and Oxford. He was ordained in 1818, and was appointed vicar of Cowley, Oxford, in 1823. In 1827 he received the rectory of West Tytherley, Hampshire, and two years later he was elected headmaster of Harrow. This office he held until 1836, when he was consecrated bishop of the new see of Ripon. In 1836 he was translated to the see of Durham, and in 1860 he became archbishop of York. In 1862 he succeeded John Bird Sumner as archbishop of Canterbury. Soon afterwards he was made Lord Bishop of London, and in 1867 he was made Archbishop of Canterbury. For a time he was concurrently Archbishop of Canterbury and Archbishop of York. He was a strong advocate of the Unitarian cause and was a member of the British and Foreign Bible Society. He died on the 27th of October 1868 at Addington Park, near Croydon.

LONGMANS, a firm of English publishers. The founder of the firm, Thomas Longman (1) (1669–1755), born in 1669, was the son of Ezekiel Longman (d. 1708), a gentleman of Bristol. Thomas was apprenticed in 1716 to John Osborn, a London bookseller. At the expiration of his apprenticeship he married Osborn's daughter, and in August 1724 purchased the stock and household goods of William Taylor, the first publisher of _Robinson Crusoe_, for £282 9s. 6d. Taylor's two shops were known respectively as the Black Swan and the Ship, and occupied the ground in Paternoster Row upon which the present publishing-house stands. Osborn, who afterwards entered into partnership with his son-in-law, held one-sixth of the shares in Ephraim Chambers's _Cyclopaedia of the Arts and Sciences_, and Thomas Longman was one of the six booksellers who undertook the responsibility of Samuel Johnson's _Dictionary_. In 1754 Thomas
Longman took his nephew into partnership, the title of the firm becoming T. and C. Longman.

Upon the death of his uncle in 1759, Thomas Longman (2) (1730-1797) became sole proprietor. He greatly extended the colonial trade of the firm. He had three sons. Of these, Thomas Norton Longman (3) (1771-1842) succeeded to the business. In 1794 Owen Rees became a partner, and Thomas Brown, who was for many years after 1811 a partner, entered the house as an apprentice. Brown died in 1839 at the age of 92. In 1790 Longman purchased the copyright of Lindley Murray's English Grammar, which had an annual sale of about 50,000 copies; he also purchased, about 1800, the copyright, from Joseph Cottle, of Bristol, of Southey's Jsoon of Arc and Wordsworth's Lyrical Ballads. He published the works of Wordsworth, Coleridge, Southey and Scott, and acted as London agent for the Edinburgh Review, which was started in 1802. In 1804 two more partners were admitted; and in 1824 the title of the firm was changed to Longman, Hurst, Rees, Orme, Brown & Green. In 1814 arrangements were made for the publication of Lalla Rookh, for which he received £3000; and when Archibald Constable failed in 1826, Longmans became the proprietors of the Edinburgh Review. They issued in 1829 Lardner's Cabinet Encyclopaedia, and in 1832 M'Callough's Commercial Dictionary.

Thomas Norton Longman (3) died on the 29th of August 1842, leaving his two sons, Thomas (4) (1804-1870) and William Longman (1813-1877), in control of the business in Paternoster Row. Their first success was the publication of Macaulay's Lays of Ancient Rome, which was followed in 1849 by the issue of the first two volumes of his History of England, which in a few years had a sale of 40,000 copies. The two brothers were well known for their literary talent; Thomas Longman edited a beautifully illustrated edition of the New Testament, and William Longman was the author of several important books, among them a History of the Three Cathedrals dedicated to St. Paul (1850) and the History of the Life and Times of Edward III. (1873). In 1863 the firm took over the business of Mr. J. W. Parker, and with it Fraser's Magazine, and the publication of the works of John Stuart Mill and J. A. Froude; while in 1890 they incorporated with their own all the publications of the old firm of Rivington, established in 1711. The family control of the firm (now Longmans, Green & Co.) was continued by Thomas Norton Longman (5), son of Thomas Longman (4).

LONGOMONTANUS (or Longreco), CHRISTIAN SEVERIN (1562-1647). Danish astronomer, was born at the village of Longberg in Jutland, Denmark, on the 4th of October 1562. The appellation Longomontanus was a Latinized form of the name of his birthplace. His father, a poor labourer called Sören, or Severin, died when he was eight years old. An uncle thereupon took charge of him, and procured him instruction at Lemvig; but after three years sent him back to his mother, who needed his help in field-work. She agreed, however, to permit him to remain with her for a year and a half. During the winter months with the clergyman of the parish; and this arrangement subsisted until 1577, when the ill will of some of his relatives and his own desire for knowledge impelled him to run away to Viborg. There he attended the grammar-school, defraying his expenses by manual labour, and carried with him to Copenhagen in 1585 a high reputation for learning and ability. Engaged by Tycho Brahe in 1580 as his assistant in his great astronomical observatory of Uraniborg, he rendered him invaluable services there during eight years. He quitted the island of Hven with his master, but obtained his discharge at Copenhagen on the 1st of June 1597, for the purpose of studying at some German universities. He rejoined Tycho at Prague in January 1600, and having completed the Tychoan lunar theory, turned homeward again in August. He visited Fraenenburg, where Copernicus had made his observations, took a master's degree at Rostock, and at Copenhagen found a patron in Christian Friis, chancellor of Denmark, who gave him employment in his household. Appointed in 1603 rector of the school of Viborg, he was elected two years later to a professorship in the university of Copenhagen, and his promotion to the chair of mathematics ensued in 1607. This post he held till his death, on the 8th of October 1647.

Longomontanus, although an excellent astronomer, was not an advanced thinker. He adhered to Tycho's erroneous views about refraction, held comets to be messengers of evil and imagined that he had squared the circle. He found that the circle whose diameter is \(43\) has for its circumference the square root of \(1825\)—which gives \(3\cdot1415\). . . for the value of \(\pi\). John Pell and others vainly endeavoured to convince him of his error. He inaugurated, at Copenhagen in 1632, the erection of a stately astronomical tower, but did not live to witness its completion. Christian IV. of Denmark, to whom he dedicated his Astronomia Danica, an exposition of the Typhonian system of the world, conferred upon him the canonry of Lunden in Schleswig.

The following is a list of his more important works in mathematics and astronomy: Systematicus Mathematici, &c. (1611); Cycloometria et Luminometrica demonstrata, &c. (1613); Disputatio Ecclesiastica (1616); Astronomia Danica, &c. (1622); Disputationes quatuor Astronomicae (1622); Penias Problematum Philosophiae (1623); De Chronologia Historico, seu de Tempore Disputations tres (1627); Geometriae quaestia XI, de Cycloometria rationali et vera (1628); Inuentatio Quadraturae Circuli (1634); Disputatio de Mathematicis Indole (1636); Coronis Problematum ex Mysteriis trium Numerorum (1637); Problematum duo Geometrica (1638); Problema contra Paulum Guicciardini de Circulo Mensura Astronomicum (1639); Rotundi in Plano, &c. (1644); Admiringa Operatio trium Numerorum 6, 7, 8, &c. (1645); Caput tertium Libri primi de absoluta Mensura Rotundi plani, &c. (1646). See also F. Virgile, Hist, de la mathématique et de la physique, p. 212 (1665); R. Neyer and Kraft, Almindeligst Litteraturleskun, p. 250 (1800); Ch. T. LONGSTREET, JAMES (1821-1904). American soldier, lieutenant-general in the Confederate army, was born on the 8th of February 1821 in Edgefield district, South Carolina, and graduated at West Point in 1842. He served in the Mexican War, was severely wounded, and received two brevets for gallantry. In 1861, having attained the rank of major, he resigned when his state seceded, and became a brigadier-general in the Confederate army. In this rank he fought at the first battle of Bull Run, and subsequently at the head of a division in the Peninsular campaign and the Seven Days. This division subsequently became the nucleus of the I. corps, Army of Northern Virginia, which was commanded throughout the war by Longstreet. This corps took part in the battles of second Bull Run and Antietam, and held the left of Lee's front at Fredericksburg. Most of the corps was absent in North Carolina when the battle of Chancellorsville took place, but Longstreet, now a lieutenant-general, returned to Lee in time to take part in the campaign of Gettysburg. At that battle he disapproved of Lee's tactics, and the consequence was that he occupied a secondarily strong position of the Federals. He has been charged with tardiness in getting into the action, but his delay was in part authorized by Lee to await an absent brigade, and in part was the result of instructions to conceal his movements, which caused circuitous marching. The most conspicuous fighting in the battle was conducted by Longstreet. In September 1863 he took his corps to the west and bore a conspicuous part in the great battle of Chickamauga. In November he commanded the unsuccessful expedition against Knoxville. In 1864 he rejoined Lee's army in Virginia, and on the 6th of May arrived upon the field of the Wilderness as the Confederate right had been turned and routed. His attack was a model of impetuosity and skill, and drove the enemy back until their entire force upon that flank was in confusion. At this critical moment, as Longstreet in person, at the head of fresh troops, was pushing the attack in the forest, he was fired upon by mistake by his own men and desperately wounded. Thenceforth he remained in the Confederate assault for several hours, and enabled the enemy to provide effective means to meet it. In October 1864 he resumed command of his corps, which he
LONGTON—LONGUS

retained until the surrender, although paralysed in his right arm. During the period of Reconstruction Longstreet's attitude towards the political problem, and the discussion of certain military incidents, notably the responsibility for the Gettysburg failure, brought the general into extreme unpopularity, and in the course of a controversy, which lasted for many years, much was said and written by both sides which could be condemned only by irritation. His acceptance of a Federal office at New Orleans brought him, in a riot, into armed conflict with his old Confederate soldiers. His admiration for General Grant and his loyalty to the Republican party accentuated the ill-feeling of the Southern people. But in time his services in former days were recalled, and he became once more "General Lee's war-horse" to his old soldiers and the people of the South. He held several civil offices, among them being that of minister to Turkey under Grant and that of commissioner of Pacific railways under Presidents McKinley and Roosevelt. In 1866 he published From Manassas to Appomattox, and in his later years he prepared an account of Gettysburg, which was published soon after his death, with notes and reminiscences of his whole military career. General Longstreet died at Gainesville, Georgia, on the 2nd of January 1904.

See Lee and Longstreet at High Tide, by Helen D. Longstreet (Gainesville, Ga., 1904).

LONGTON, a market-town of Staffordshire, England, on the North Staffordshire railway, 2 ½ m. S.E. of Stoke-on-Trent, within which parliamentary and municipal borough it is included. Pop. (1901) 33,815. The town is in the Potteries district, and in the neighbourhood of coal and iron mines. It was governed by a mayor, 10 aldermen and 30 councillors until the "Potteries Federation" scheme (1908) it became part of the borough of Stoke-on-Trent in 1910.

LONGUEVILLE, the name of a French family which originated with Jean, count of Dunois, the "Bastard of Orleans," to whom Charles VII. gave the countshhip of Longueville in Normandy in 1443. François of Orleans, count of Longueville, was created Duke in 1505. The marriage of his brother Louis with Jeanne, daughter and heiress of Philip, count of Baden-Hochberg-Sausenberg (d. 1505), added considerable estates to the house of Longueville. Henry, duke de Longueville (d. 1663), took an important part in the Fronde, and for a long time held the royal troops in check in Normandy. His wife, Anne Geneviève (see below), was a leading figure in the political dissensions of the time. The last of the family was Jean Louis, the Abbe d'Orellián, who died in 1694. The numismatist, Charles d'Orléans-Rothelin (1601-1744), belonged to a bastard branch of the family.

LONGUEVILLE, ANNE GENEVIÈVE, DUCHESE DE (1619-1679), was the only daughter of Henri de Bourbon, Prince de Condé, and his wife Charlotte Marguerite de Montmorency, and the sister of Louis, the great Condé. She was born on the 28th of August 1619, in the prison of Vincennes, into which her father and mother had been thrown for opposition to Marshal D'Ancre, the favourite of Marie de' Medici, who was then regent in the minority of Louis XIII. She was educated at the convent of the Carmelites in the Rue St Jacques at Paris. Her early years were clouded by the execution of the duke de Montmorency, her mother's only brother, for intriguing against Richelieu in 1631, and that of her mother's cousin the comte de Montmorency-Bouetteville for dwelling in 1635; but her parents made their peace with Richelieu, and being introduced into society in 1635 she soon became one of the stars of the Hôtel Rambouillet, at that time the centre of all that was learned, witty and gay in France. In 1642 she was married to the duc de Longueville, governor of Normandy, a widower twice her age.

The marriage was not happy. After Richelieu's death her father became chief of the council of regency during the minority of Louis XIV., her brother Louis won the great victory of Rocroy in 1633 (see Condé), and the duchess became of political importance. In 1646 she accompanied her husband to Münster, where he was sent by Mazarin as chief envoy, and where she charmed the German diplomats who were making the treaty of Westphalia, and was addressed as the "goddess of peace and concord." On her return she fell in love with the duc de la Rochefoucauld, the author of the Maxims, who made use of her love to obtain influence over her brother, and thus win honours for himself.

She was the guiding spirit of the first Fronde, when she brought over Armand, Prince de Conti, her second brother, and her husband to the malcontents, but she failed to attract Condé himself, whose loyalty to the court overthrew the first Fronde. It was during the first Fronde that she lived at the Hôtel de Ville and took the city of Paris as god-mother for the child born to her there. The peace did not satisfy her, although La Rochefoucauld won the titles he desired. The second Fronde was largely her work, and in it she played the most prominent part in attracting to the rebels first Condé and later Turenne. In the last year of the war she was accompanied into Guienne by the duc de Nemours, her intimacy with whom gave La Rochefoucauld an excuse for abandoning her, and who himself immediately returned to his old mistress the duchesse de Chevreuse. Thus abandoned, and in disgrace at court, the duchess betook herself to religion. She accompanied her husband to his government at Rouen, and devoted herself to good works. She took for her director M. Simonin, famous in the history of Port Royal. She chiefly lived in Normandy till 1663, when her husband died, and she came to Paris. There she became more and more Jansenist in opinion, and her piety and the remembrance of her influence during the disastrous days of the Fronde, and above all the love her brother, the great Condé, bore her, made her conspicuous. The king pardoned her and in every way showed respect for her. She became the great protectress of the Jansenists; it was in her house that Arnauld, Nicole and De Lane were protected; and to her influence must be in great part attributed the release of Lemaistre De Sacy from the Bastille, the introduction of Pomponne into the ministry and of Arnauld to the king. Her famous letters to the pope are part of the history of Port Royal (q.v.), and as long as she lived the nuns of Port Royal des Champs were left in safety. Her elder son resigned his title and estates, and became a Jesuit under the name of the Abbe d'Orelliéons, while the younger, after leading a debauched life, was killed leading the attack in the passage of the Rhine in 1673. As her health failed she hardly ever left the convent of the Carmelites in which she had been educated. On her death in 1679 she was buried with great splendour by her brother Condé, and her heart, as she had directed, was sent to the nuns of the Port Royal des Champs.

The chief authority for Madame de Longueville's life is a little book in two volumes by Villevire the Jansenist, published in 1738. Victor Cousin has devoted four volumes to her, which, though immensely diffuse, embody a great deal of biographical knowledge. In his Souvenirs de Madame de Port-Royal, Brissot de Warville (q.v.) has the history of Port Royal. The connexion with Port Royal should be studied in Arnauld's Mémoirs, and in the different histories of that institution.

LONGUS, Greek sophist and romancer, author of Daphnis and Chloé. Nothing is known of his life, and all that can be said is that he probably lived at the end of the 2nd or the beginning of the 3rd century A.D. It has been suggested that the name Longus means "long" in the sense of "stretched out," and that it was in some way connected with the word for "eunuch" (Greek αὐτώρωμα λέγεται Λόγυρος in the Florentine MS.; Seilor also observes that the best MS. begins and ends with λόγυρος (not λόγυρον) τοιχικούς. If his name was really Longus, he was probably a freedman of some Roman family which bore it. Longus's style is rhetorical, his shepherds and shepherdesses are wholly conventional, but he has imparted human interest to a purely fanciful picture. As an analysis of feeling, Daphnis and Chloé makes a nearer approach to the modern novel than its chief rival among Greek erotic romances, the _Aethiopis_ of Heliodorus, which is remarkable mainly for the ingenious succession of incidents. Daphnis and Chloé, two children found by shepherds, grow up together, nourishing a mutual love which neither suspects. The development of this simple passion forms the chief interest, and there are few incidents. Chloé is carried off by a pirate, and ultimately regains her family. Rivals alarm the peace of mind of Daphnis; but the two lovers are recognized by their parents, and return to a happy married life in the country. Daphnis and Chloé was the model of La Sireine of Honoré d'Urfé, The Diana enamoured of

---

[Note: The text continues with additional information and context related to Longus and his work. However, due to the length and complexity of the extract, a detailed transcription is not provided here.]
Montemayor, the Aminta of Tasso, and The Gentle Shepherd of Allan Ramsay. The celebrated Paul et Virginie is an echo of the same vein.

See J. Dunlop’s History of Prose Fiction (1888), and especially E. Rohde, Der griechische Roman (1900). Longus found an incomparable translator in Jacques Amyot, bishop of Auxerre, whose French version, as revised by Paul Louis Courier, is better known than the original. In 1879, there was published an edition of the Greek text at Florence by Columbani. The chief subsequent editions are those by G. Jungmann (1665), J. B. de Viloisot (1778, the first standard text with commentary), Aronies (Coray) (1804), P. L. Courier (1810), with a newly discovered manuscript by E. Seiler (1835), R. Hercher (1858), N. Piccolos (Paris, 1866) and Kiefer (Leipzig, 1904), W. D. Lowe (Cambridge, 1908). A. J. Pons’s edition (1878) of Courier’s version contains an exhaustive bibliography. There are also editions of the Persian (1760), the Hebrew (1863), C. V. Le Grice (1803), Smith (in Bohn’s Classical Library, 1845), and the rare Elizabethan version by Angel Day from Amyot’s translation (ed. J. Jacobs in Tudor Library, 1896). The illustrated editions, generally of Amyot’s version, have added some beautiful, Prudhon’s designs being especially celebrated.

LONGWY, a fortified town of north-eastern France in the department of Meurthe-et-Moselle, 89 m. N.N.W. of Nancy by rail. Pop. (1906) 8,253. Longwy is situated on a plateau overlooking the Chiers, a right-bank affluent of the Meuse, near the frontiers of Belgium and Luxemburg. It comprises an upper and a lower town; the former, on a hill, 390 ft. above the Chiers valley, commands the Luxembourg road, and is strengthened by an encinte and a few outlying fortifications. There is garrison accommodation for 5,000 men and 800 horses, but the permanent garrison is small. The lower town is the industrial centre. The 17th-century church has a lofty square tower, the hôtel de ville dates from 1730, and there is a fine hospital.

Iron is extensively mined in the district, and supplies numerous blast furnaces. Several iron and steel works are in operation, and metal utensils, fire-proof ware and porcelain are manufactured. Longwy (1,003 ft.) came into the possession of the French in 1678 and was at one time fortified by Vauban. It was captured by the Prussians in 1792, 1815 and 1871.

LÖNNROT, ELIAS (1802-1884), Finnish philologist and discoverer of the Kalevala, was born at Nyland in Finland on the 9th of April 1802. He was an apothecary’s assistant, but entered the university of Åbo in 1822, and after taking his successive degrees became a physician in 1832. But before this, as early as 1827, he had begun to publish contributions to the study of the ancient Finnish language, and to collect the national ballads and folk-lore, a field which was at that time uncultivated. In 1833 he settled as a doctor in the country district of Kajana, and began to travel throughout Finland and the adjoining Russian provinces in his leisure time, collecting songs and legends. In this way he was able to put together the great epic of Finland, the Kalevala, the first edition of which he published in 1835, a second in 1839, and a third in 1840. In 1839 Lönnrot issued his important collection of the Kanteletar, or folk-songs of ancient Finland, which he had taken down from oral tradition. The Proverbs of Finland followed in 1842. In 1853, on the death of Castén, Lönnrot became professor of the Finnish language and literature at the high school of Helsingfors; he retired from this chair in 1862. He died on the 10th of March 1884.

LONSDALE, EARLS OF. This English earldom is held by the ancient family of Lonsdale, which traces its descent to Sir Hugh Lowther, who flourished in the reign of Edward I. Sir Hugh’s descendant Sir Richard Lowther (1529-1607) received Mary queen of Scots on her flight into England in 1568, and in the two following years was concerned with his brother Gerard in attempts to release her from captivity. He was sheriff of Cumberland and lord warden of the west marches. A house built by Gerard Lowther at Penrith is now the “Two Lions Inn.” Sir Richard’s eldest son, Sir Christopher Lowther (1617), was the ancestor of the later Lorthwars, and another son, Sir Gerard Lowther (d. 1624), was judge of the common pleas in Ireland.

One of Sir Christopher’s descendants was Sir John Lowther, Bart. (d. 1706), the founder of the trade of Whitehaven, and another was John Lowther (1655-1700), who was created Viscount Lonsdale in 1666. Before this creation John had succeeded his grandfather, another Sir John Lowther (d. 1675), as a baronet, and had been member of parliament for Westmorland from 1675 to 1666. In 1688 he was serviceable in securing Cumberland and Westmorland for William of Orange; in 1690 he was first lord of the treasury, and he was lord privy seal from March 1690 until his death in July 1700. Lonsdale wrote Memoirs of the Reign of James II., which were printed in 1808 and again in 1857. His family became extinct when his nephew, the 3rd viscount (1604-1751), died unmarried in March 1751.

John Lowther, 1st earl of Lonsdale (1736-1802), was a son of Robert Lowther (d. 1745) of Maulds Meaburn, Westmorland, who was for some time governor of Barbados, and was descended from Sir Christopher Lowther; through his mother Catherine Pennington, James was a great-grandson of the 1st viscount Lonsdale. He inherited one of the family baronetcies in 1751, and from three sources he obtained immense wealth, being the heir of the 3rd viscount Lonsdale, of Sir James Lowther, Bart. (d. 1755) of Whitehaven, and of Sir William Lowther, Bart. (d. 1756). From 1752 to 1784 he was a member of parliament, exercising enormous influence on elections in the north of England and usually controlling nine seats in the House of Commons, where his nominees were known as “Sir James’s ninepins.” He secured the election of William Pitt as member for his borough of Appleby in 1781, and his dispute with the 3rd duke of Portland over the possession of the sojourn manor of Carlisle and the forest of Inglewood gave rise to lengthy proceedings, both in parliament and in the law courts. In 1784 Lowther was created earl of Lonsdale and in 1797 Viscount Lowther with an extended remainder. The earl’s enormous wealth enabled him to gratify his political ambitions. Sir N. W. Wraxall (Historical and Personal Memoirs, ed. H.B. Wheatley, 1884), who gives interesting glimpses of his life, speaks of his “prodigious property” and quotes Junius, who called him “the little contemptible tyrant of the north.” He was known as the “bad earl,” and Horace Walpole and others speak slightly of him; he was, however, a benefactor to Whitehaven, where he boasted he owned the “land, fire and water.”

He married Mary (1768-1824) daughter of George III’s favourite, John Stuart, 3rd earl of Bute, but died childless on the 24th of May 1802, when the earldom became extinct; but a kinsman, Sir William Lowther, Bart. (1757-1844), of Swillington, became 2nd viscount Lowther. This viscount, who was created earl of Lonsdale in 1807, is chiefly famous as the friend of Wordsworth and the builder of Lowther Castle, Penrith. His son, William Lowther, 3rd earl of Lonsdale (1787-1872), held several subordinate positions in various Tory ministries, and was lord president of the council in 1852. He died unmarried, and was succeeded by his nephew Henry (1818-1879), whose son Hugh Cecil (b. 1857) succeeded his brother as 6th earl of Lonsdale in 1882.

Other prominent members of the Lowther family are the Right Hon. James William Lowther (b. 1855), who became speaker of the House of Commons in 1905; Sir Gerard Augustus Lowther (b. 1858), who became British ambassador at Constantinople in 1908; and the Right Hon. James Lowther (1840-1904), who was a well-known Conservative member of parliament from 1865 onwards, and chief secretary for Ireland from 1878 to 1880.

LONSDALE, WILLIAM (1794-1871), English geologist and palaeontologist, was born at Bath on the 9th of September 1794. He was educated for the army and in 1810 obtained a commission as ensign in the 4th (King’s Own) regiment. He served in the Peninsular War at the battles of Salamanca and Waterloo, for both of which he received medals; and he retired as lieutenant. Residing afterwards for some years at Bath he collected a series of rocks and fossils which he presented to the Literary and Scientific Institution of Bath. He became the first honorary curator of the natural history department of the museum, and worked until 1829 when he was appointed assistant secretary and curator of the Geological Society of London.
at Somerset House. There he held office until 1842, when ill-
health led him to resign. The ability with which he edited the publica-
tions of the society and advised the council “on every obscure and difficult point” was commented on by Murchison in his presidential address (1843). In 1829 Lonsdale read before the society an important paper “On the Oolitic District of Bath” (Trans. Geol. Soc. ser. 2, vol. iii.), the results of a survey begun in 1827; later he was engaged in a survey of the Oolitic strata of Gloucestershire (1832), at the instigation of the Geological Society, and he laid down on the one-inch ordnance maps the boundaries of the various geological formations. He gave particular attention to the study of corals, becoming the highest authority in England on the subject, and he described fossil forms from the Tertiary and Cretaceous strata of North America and from the other strata of Britain and Russia. In 1837 he suggested from a study of the fossils of the South Devon lime-
stones that they would prove to be of an age intermediate between the Carboniferous and Silurian systems. This suggestion was adopted by Sedgwick and Murchison in 1839, and may be regarded as the basis on which they founded the Devonian system. Lonsdale’s paper, “Notes on the Age of the Limestones of South Devonshire” (read 1840), was published in the same volume of the Transactions of the Geological Society (ser. 2, vol. v.) with Sedgwick and Murchison’s famous paper “On the Physical Structure of Devonshire”, and these authors observe that “the conclusion arrived at by Mr Lonsdale, we now apply without reserve both to the five groups of our North Devon section, and to the fossiliferous slates of Cornwall.” The latter years of Lonsdale’s life were spent in retirement, and he died at Bristol on the 11th of November 1871. (H. B. Wo.)

LONS-LE-SAUNIER, a town of eastern France, capital of the department of Jura, 76 m. N.N.E. of Lyons on the Paris-Lyons railway, on which it is a junction for Chalon-sur-Saône, Dôle, Besançon and Champagnole. Pop. (1906) 10,648. The town is built on both sides of the river Vallière and is surrounded by the vine-clad hills of the western Jura. It owes its name to the salt mines of Montmort, its western suburb, which have been used from a very remote period. The church of St Désiré, a member of the 12th and 13th centuries, preserves a huge Romanesque crypt. The town is the seat of a prefect and of a court of assizes, and there are tribunals of first instance and of commerce, a chamber of commerce, lycées and training-colleges for both sexes, and a branch of the Bank of France. There is an important industry of the use of the mineral waters, which are soda-chlorinated and have strengthening properties. The principal industry of the place is the manufacture of sparkling wines, the Étoile growth being the best for this purpose. Trade is in cheese, cereals, horses, cattle, wood, &c.

Lons-le-Saunier, known as Lado in the time of the Gauls, was fortified by the Romans, who added the surname Salinarus to the Gallic name. An object of contention owing to the value of its salt, it belonged for a long time during the medieval period to the powerful house of Chalon, a younger branch of that of Burgundy, and afterwards passed to the English, and again in 1337, when it was seized by the duke of Longueville for Louis XIII. It became definitively French in 1674. It was here that the meeting between Ney and Napoleon took place, on the return of the latter from Elba in 1815. Rouget de l’Eule, the author of the Marseillaise, was born at Montaigu near this town, where there is a statue erected to him.

LOO (formerly called "Lanterloo," Fr. lanturie, the refrain of a popular 17th-century song), a round game of cards, played by any number of persons; from five to seven makes the best game. "Three-card loo" is the game usually played. An ordinary pack of fifty-two cards is used and the deal passes after each round. Each player must have the same number of deals; but if there is a "loo" (the sum forfeited by a player who plays, but does not win a trick) in the last deal of a round, the game continues till there is a hand without a loo. The dealer deals three cards face downwards, one by one, to each player and an extra hand called "miss," and turns up the top of the undealt cards for trumps. Each player contributes to the pool a sum previously agreed upon. The unit for a single stake should be divisible by three without a remainder, e.g. three counters or three pence. The players are bound to put in the stake before the deal is completed. Each player in rotation, beginning from the dealer’s left, looks at his cards, and declares whether he will play, or pass, or take "miss." If the former, he says "I play." If he takes miss he places his cards face downwards in the middle of the table, and takes up the extra card. If he passes, he similarly places his cards face downwards in the middle of the table. If miss is taken, the subsequent players only have the option of playing or passing. A player who takes miss must play. Those who are now left in play one card each in rotation, beginning from the dealer’s left, the cards thus played constituting a trick. The trick is won by the highest card of the suit led, or, if trumped, by the highest trump, the cards ranking as at whist. The winner of the trick leads to the next, and so on, until the hand is played out. The cards remain face upwards in front of the persons placing them. If the leader holds ace of trumps he must lead it (or king, if ace is turned up). If the leader has two trumps he must lead one of them, and if one is ace (or king, ace being turned up) he must lead it. With this exception the leader is not bound to lead his highest trump if more than two declare to play; but if there are only two declared players the leader with more than one trump must lead the highest. Except with trumps as above stated he may lead any card he chooses. The subsequent players must head the trick if able, and must follow suit if able. Holding none of the suit led, they must head the trick with a trump, if able. Otherwise they may play any card they please. The winner of the trick is subject to the rules already stated respecting the lead, and in addition he must lead a trump if able (called trump after trick).

When the hand has been played out, the winners of the tricks divide the pool, each receiving one-third of the amount for each trick. If only one has declared to play, the dealer plays miss either for himself or for the pool. If he plays for the pool he may for "miss" deal an Irish "loo," i.e. play by allowing himself any tricks he may win, when playing for the pool, remain there as an addition to the next pool. Other rules provide that the dealer must play, if only one player stands, with his own cards or with "miss." If miss is gone against him, he may defend with the three top cards of the pack, excluding the trump card; these cards are called "master." If each declared player wins at least one trick it is a single, i.e. a fresh pool is made as already described; but if one of the declared players fails to make a trick he is looed. Then only the player who is looed contributes to the next pool. If more than one player is looed, each has to contribute. At unlimited "loo" each player looed to has to put in the amount there was in the pool. But it is often agreed to limit the loo, so that it shall not exceed a certain fixed sum. Thus, at eighteen-penny loo, the loo is generally limited to half a guinea. If there is less than the limit in the pool the payment is regulated as before; but if there is more than the limit, the fixed sum is added to.

The game is sometimes varied by "forces," i.e. by compelling everyone to play in the first deal, or when there is no "loo" the previous deal, or whenever clubs are trumps ("club law"). When there is an "Irish loo" the dealer deals an Irish "loo" and has also at declared players to exchange some or all of their cards for cards dealt from the top of the pack. There is no "miss," and it is not compulsory to lead a trump with two trumps, unless there are only two declared players. After each "Irish loo" there are five cards instead of three, and a single stake should be divisible by five. "Passes" (knave of clubs) ranks as the highest trump, whatever suit is turned up. There is no "miss," and cards may be exchanged as at Irish loo. If ace of trumps is led, the leader says, "I am civil," when the holder of that card must pass the trick if he does not wish to play. A flush (five cards of the same suit, or four with Pam) "loos the board," i.e. the holder receives the amount of a loo from every one, and the hand is not played. A trump flush takes precedence of flushes in other suits. If one flush beats another, the player of the higher flush is exempted from payment. As between two flushes which do not take precedence, the elder hand wins. A single stake should be divisible by five.

LOOE, a seaport and market town in the Bodmin parlia-
mentary division of Cornwall, England, 17 m. by sea W. of Plymouth, a terminus of the Liskeard & Looe light railway.
LOOM—LOOP

Pop. (1901) 2548. It is divided by the river into East Looe and West Looe; and is sheltered so completely by the surrounding hills that myrtles, geraniums, fuchsias and other delicate plants flourish at all seasons in the open air. Its lanes are narrow, steep and winding; many of the houses are entered by wooden staircases; and though considerably modernized the town has a medieval air. Inland, the shores of the river are richly wooded; and towards the sea they rise on the south into rugged cliffs. The parish church of St Martin, which stands 1 m. outside the town, has a Norman doorway and font. Among other buildings may be mentioned the ancient chapel of St Nicholas in West Looe, restored in 1862; and the old town-hall, where the ancient pillory is preserved. A considerable export trade in copper, tin and granite was formerly carried on, and the last is still exported, but the chief trade is in grain; while timber, coal and limestone are imported. There are also thriving fisheries, the Looe fishermen being particularly expert with the seine on a rocky bottom. The inlet of Trelawne is one of the most exquisite wooded coombes in Cornwall. At its head are the remains of a camp, connected with the Giant’s Hedge, a raised earthwork which extends for 7 m. in a straight line, as far as a larger camp, on Bury Down, and is of Danish or Saxon construction. Trelawne, a fine old mansion belonging to the family of Trelawny, dates in part from the 15th century, but has been very largely restored.

The harbourage was probably the original cause of settlement at Looe. At the time of the Domesday Survey East Looe was assessed under Pendracy, which was of the king’s demesne and West Looe under Hamelin’s manor of Trelowra. In the 14th century the former manor was held by the family of Bodrugan; the latter by that of Dauney, who had inherited it from the Treverbynys. In 1357 Henry Bodrugan received the grant of a market on Fridays and a fair at Michaelmas in his manor of Pendracy. In 1395 his grandson and namesake granted to East Looe a market and fair, with the privilege of erecting their own portmee and controlling the trade of the town. This grant was in 1558 under which the common council was to consist of a mayor and 8 chief burgesses. There was to be a court of record, a market on Saturdays and fairs at Michaelmas and Candlemas. In 1685 James II. provided that there should be a mayor and 11 aldermen, 36 free burgesses, 4 fairs and a court of pie powder. East Looe was governed under this charter until 1885. West Looe (known also as Perrigian or Porbuann) benefited by a charter granted by Richard king of the Romans to Odo Treverbyn and ratified in 1325 constituting it a free borough whose burgesses were to be free of all custom throughout Cornwall. Residence for a year and a day within the borough conferred freedom of servitude. There were to be a market on Wednesdays and a fair at Michaelmas. Hugh son of Odo Treverbyn gave West Looe the privileges enjoyed by Helston and Launceston. Upon the attainder of the earl of Devon in 1393 the borough fell to the crown and was annexed to the duchy. In 1574 a charter of incorporation was granted, providing for the nomination of a mayor, 12 aldermen, and two fairs. West Looe continued to be administered under this charter until 1869, when the death of the mayor deprived the council of its only surviving member and elector. Parliamentary representation was conferred upon East Looe in 1571 and upon West Looe in 1553. In the debate on the reform bill O’Connell stated that there was but one borough more rotten than East Looe and that was West Looe. West looe was second only to Fowey as a port in the 15th century. It furnished 20 ships for the siege of Calais. Of the markets and fairs only the markets on Wednesdays and Saturdays and a fair on the 6th of May remain.

LOOM, or LOON (Icelandic, Ljomr), a name applied to water-birds of three distinct families, remarkable for their clumsy gait on land. 1 The first is the Colymbidae, to which the term diver (g.v.) is usually restricted in books; the second the Podicipitidae, or grebes (g.v.); and the third the Alcidae. The form loom is most commonly used both in the British Islands and in North America for all species of the genus Colymbus, or Eudyptes according to some ornithologists, frequently with the prefix sprat, indicating the fish on which they are supposed to prey; though it is the local name of the great crested grebe (Podiceps cristatus) wherever that bird is sufficiently well known to have one; and, as appears from Green (Mus. Reg. Soc. p. 69), it was formerly given to the little grebe or dabchick (P. flavirostris or minor). The other form loom seems more confined in its application to the north, and is said by T. Edmonston (Etym. Gloss. Scotl. and Ork. Dialect, p. 67) to be the proper name in Shetland of Colymbus septentrionalis; but it has come into use among Arctic seamen as the name of the guillemot (Alca arctica or brunnichi) which throngs the cliffs of northern lands, from whose "loomers" they obtain a wholesome food; while the writer believes he has heard the word locally applied to the razorbill (g.v.). (A.N.)

LOOM, a machine for weaving fabrics by intersecting the longitudinal threads, the "warps," i.e., "that which is thrown across." (O.E. værf, from weoran, to throw, cf. Ger. werfen) with the transverse threads, the "welt," i.e., "that which is woven." (O.E. wefa, from wefan, to weave, cf. Ger. weben.) The O.E. geloma and M.E. lome meant an implement or tool of any kind. In the sense of property, furniture, &c., it appears in heirloom (g.v.). The earliest example with its specific meaning quoted by the New English Dictionary is from the Nottingham Records of 1404 (see WEAVING).

"Loom" in the sense of "to appear indistinctly," to come into view in an exaggerated indistinct shape, must be distinguished from the warping, or "looming" of a word. This appears to have been a sailor's term for the indistinct or exaggerated appearance of a land, a vessel or other object through haze or darkness at sea. It is of obscure origin, but has been connected with the O. Fr. lamer, modern allumer, with Lat. lamina, light, and which is not seen in lame, in the sense of moving slowly towards one.

LOON, the largest town of the province of Bohol, island of Bohol, Philippine Islands, on the extreme W. coast. Pop. (1903) 18,114. Loon is picturesquely situated on the W. slope of a hill, and is reached from the sea by steps cut in the rocks. The harbour is in a sheltered bay on the N. side of the town. The cultivation of coco-nuts, coffee, cocoa, maguey, tobacco, cotton and Indian corn, and the raising of livestock are the principal industries; there is also considerable commerce and some manufacturing. The language is chiefly Bohol-Visayan.

LOOP. (1) A curve or bend, particularly a bend in a string, rope, &c., formed by doubling back one part so as to leave an opening; similarly a ring of metal or other material leaving an aperture. (2) In architecture or fortification, "loop," more usually in the form "loophole," is an opening in the wall of a building, very narrow on the outside and splayed within, from which arrows or darts might be discharged on an enemy, or through which light might be admitted. They are often in the form of a goss, and generally have round holes at the ends, (see OILLET). (3) The word is also a term in iron and steel manufacturing for a mass of metal ready for hammering or rolling, a "bloom."

This last word is represented in French by loupe, from which it is probably adapted. The earlier English form was also loupe, and it was also applied to precious stones which were of inferior brilliancy; the same also appears in French. Of the word in its two meanings, the first is perhaps the bond of string, metal, rails, &c., and "loophole," the derivation is uncertain. Skeat takes the word in both meanings to be the same and to be of Scandinavian origin, the old Norwegian loopa, a leap, being the direct source. The base is the Teutonic lope, to leap, and loopa is simply an old Germanic borrowing. The New English Dictionary considers the Swedish example, lop-knut, "running knot," and others given by Skeat in support of his derivation to be Germanisms, and also that the pronunciation of the word would have been leap rather than lab. Loop is also taken to be a different word, and is derived from Dutch luspen, to peer, watch. In modern Dutch the word for a narrow opening is glip. 1 Dunn and Saxby, however, agree in giving "rain-goose" as the name of the species in Scotland.
LOOSESTRIFE, in botany, the common name of *Lythrum salicaria*, an erect plant, 2 to 4 ft. high, common on river banks in England, with red flowers in tassel-like racemes or spikes, and terminal panicles of rather large deep yellow flowers. It is a member of the primrose family, *L. vulgaris*, yellow pimpernel, or wood loosestrife, a low-growing plant with slender spreading stem, and somewhat similar yellow flowers standing singly in the leaf-axils, is frequent in copses. *L. salicaria* is the well-known creeping Jenny or money-wort, a larger plant with widely creeping stem, pairs of shining leaves and large solitary yellow flowers; it is found on banks of rivers and damp woods, and is a common rockery plant. Purple loosestrife, *Lythrum Salicaria*, belongs to a different family, *Lythraceae*. It is a handsome plant growing 2 to 6 ft. high on river banks and ditches, with a branched angled stem bearing whorls of narrow pointed stalkless leaves and ending in tall tapering spikes of beautiful rose-purple flowers. The flowers are tri-morphic, that is to say, exist in three forms which differ in the relative length of the styles and stamens and are known as long-styled, mid-styled and short-styled forms respectively; the size and colour of the petals also differ. These differences play an important part in the pollination of the flower.

LOOT, plunder or spoil taken from an enemy in war, especially the indiscriminate plunder taken by the victor after the capture of a city. The word came into English from India. It is adapted from the Hindi lāt, which is either from Sanskrit līvat, to rob, plunder, or lōtra, lōpra, booty.

LOPES, FERNÃO (1380–1457), the patriarch of Portuguese historians, was appointed keeper of the royal archives, then housed in the castle of St George in Lisbon, by King John I. in November 1418. He acted as private secretary to the Infants D. Duarte and D. Fernando, and when the former ascended the throne he charged Lopes, by letter of the 19th of March 1434, with the work of “putting into chronicles the stories of the kings of old time as well as the great and lofty actions of the most virtuous king my lord and father” (John I.). The form of the appointment marked its limits, and is a sufficient reply to those modern critics who have censured Lopes for having written his official title of chief chronicler of the realm, he was the king’s man (*Vassallo do Rei*), and received his salary from the royal treasury. King Alphonso V confirmed him in his post by letter of the 3rd of June 1449, and in 1454, after thirty-six years’ service in the archives and twenty as chronicler, he resigned in favour of Gomez Eannes de Azurara. The latter pays a tribute to his predecessor as “a notable person, a man of rare knowledge and great authority,” and the modern historian Herculano says, “there is not only history in the chronicles of Fernão Lopes, there is poetry and drama as well; there is the middle age with its faith, its enthusiasm, its love of glory.” Lopes has been called the Portuguese Froissart, and that rare gift, the power of making their subjects live, is common to the two writers; indeed, had the former written in a better-known language, there can be little doubt that the general opinion of critics would have confirmed that of Robert Southey, who called Lopes “the best point of comparison the Portuguese literature offers with the national literature of any country.” The first to put a record of the stories of the earlier Portuguese monarchs, and he composed a general chronicle of the kingdom, which, though it never appeared under his name, almost certainly served as a foundation for the chronicles of Ruy de Pina (*p.s.*). Lopes prepared himself for his work with care and diligence, as he tells us, not only by wide reading of books in different languages, but also by a study of the archives belonging to municipalties, monasteries and churches, both in Portugal and Spain. He is usually a trustworthy guide in facts, and charms the reader by the naive simplicity of his style.

His works that have come down are: (1) *Chronica del Rei D. J90001. de boa memoria,* parts 1 and 2 (Lisbon, 1644). The third part relating the capture of Ceuta was added by Azurara. A corrected text of the chronicle has been issued by installments in the *Archivo Histórico Portugues*, (2) “ Chronica do senhor rei D. Fernando published in the same volume and collection. The British Museum has some important 16th-century MSS. of the chronicles. See Damião de Goes, *Chronica del Rei Dom Manuel,* part iv, ch. 38; Anulo Morato, in redaction to vol. iv. of the above collection; Herculano, *Opusculos,* vol. v. (E. P. R.)

LOPES, CARLOS ANTONIO (1790–1862), Paraguayan autocrat, was born at Asuncion on the 4th of November 1790, and was educated in the ecclesiastical seminary of that city. He attracted the hostility of the dictator, Francia, and he was forced to keep in hiding for several years. He acquired, however, so unusual a knowledge of law and governmental affairs that, on Francia’s death in 1840, he obtained an almost undisputed control of the Paraguayan state, which he maintained uninterruptedly until his death on the 10th of September 1862. He was successively secretary of the ruling military junta (1840–1841), one of the two consuls (1841–1844), and president with dictatorial powers (1844–1862) by successive elections for ten and three years, and in 1857 again for ten years, with power to nominate his own successor. Though nominally a president acting under a republican constitution, he ruled despotically. His government was in general directed with wise energy towards developing the material resources and strengthening the military power of the country. His jealousy of foreign approach several times involved him in diplomatic disputes with Brazil, England, and the United States, which nearly resulted in war, but each time he extricated himself by skilful evasions.

His eldest son, FRANCISCO SOLANO LOPES (1826–1870), was born near Asuncion on the 24th of July 1826. When in his nineteenth year he was made commander-in-chief of the Paraguayan army, during the spasmatic hostilities then prevailing with the Argentine Republic. He was sent in 1853 as minister to England, France and Italy, and spent a year and a half in Europe. He purchased large quantities of arms and military supplies, together with several steamers, and organized a project for building a railroad and establishing a French colony in Paraguay. He also formed the acquaintance of Madame Lynch, an Irish adventurer of many talents and popular qualities, who made, his mistress, and strongly influenced his later ambitious schemes. Returning to Paraguay, he became in 1853 minister of war, and on his father’s death in 1862 at once assumed the reins of government as vice-president, in accordance with a provision of his father’s will, and called a congress by which he was chosen president for ten years. In 1864, in his self-styled capacity of “protector of the equilibrium of the La Plata,” he demanded that Brazil should abandon her armed interference in a revolutionary struggle then in progress in Uruguay. No attention being paid to his demand, he seized a Brazilian merchant steamer in the harbour of Asuncion, and threw into prison the Brazilian governor of the province of Matto Grosso who was on board. In the following month (December 1864) he despatched a force to invade Matto Grosso, which seized and sacked its capital Cuyabá, and took possession of the province and its diamond mines. Lopes next sought to send an army to the relief of the Uruguayan president Agüero against the revolutionist Tigrean Flores, who was sustained by the French troops. The refusal of the Argentine president, Mitre, to allow this force to cross the intervening province of Corrientes, was seized upon by Lopes as an occasion for war with the Argentine Republic. A congress, hastily summoned, and composed of his own nominees, bestowed upon Lopes the title of marshal, with extraordinary war powers, and on April 13, 1865, he declared war, at the same time seizing two Argentine war-vessels in the bay of Corrientes, and on the next day occupied the town of Corrientes, instituted a provisional government of his Argentine partisans, and summarily announced the annexation to Paraguay of the provinces of Corrientes and Entre Rios. Meantime the party of Flores had been successful in Uruguay, and that state on April the 18th united with the Argentine Republic in a declaration of war on Paraguay. On the 1st of May Brazil joined these two states in a secret alliance, which stipulated that they should unitedly prosecute the war “until the existing government of Paraguay should be overthrown.”
and "until no arms or elements of war should be left to it."

This agreement was literally carried out. The war which ensued, lasting until the 1st of April 1870, was carried on with great stubbornness and with alternating fortunes, though with a steadily increasing tide of disasters to Lopez (see PARAGUAY).

In 1868, when the allies were pressing him hard, his mind, naturally suspicious and revengeful, led him to conceive that a conspiracy had been formed against his life in his own capital and by his chief adherents. Thereupon several hundred of the chief Paraguayan citizens were seized and executed by his order, including his brothers and brothers-in-law, cabinet ministers, judges, prefects, military officers, bishops and priests, and ninetenths of the civil officers, together with more than two hundred foreigners, among them several members of the diplomatic legations. Lopez was at last driven with a mere handful of troops to the northern frontier of Paraguay, where, on the 1st of April 1870, he was surprised by a Brazilian force and killed as he was endeavouring to escape by swimming the river Aquidaban.

LOPEZ DE GÓMARA, FRANCISCO (1510?-1555?). Spanish historian, was educated at the university of Alcalá, where he took orders. Soon after 1540 he entered the household of the famous Cortés, who supplied him with most of the material for his Historia de las Indias (1552), and Crónica de la conquista de Nueva España (1552). The pleasing style and novel matter enriched the Spanish public, but the unmeasured laudation of Cortés at the expense of his lieutenants and companions brought about a violent reaction. Though the Historia was dedicated to Charles V., both works were forbidden on the 17th of November 1553, and no editions of them were issued between 1554 and 1777. Italian and French versions of his books were published in 1556 and 1578 respectively.

LOP-NOR or Lob-nor, a lake of Central Asia, in the Gobi Desert, between the A斯坦tagh (Altyn-tagh) on the south and the Kuruk-tag on the north. Previous to 1876 it was placed in nearly all maps at 42° 30' N., a position which agreed with the accounts and the maps of ancient Chinese geographers. In the year mentioned the Russian explorer Przhevalsky discovered two closely connected lake-basins, Kara-buran and Kara-koshun, fully one degree farther south, and considerably east of the site of the old Lop-nor, which lake-basins he nevertheless regarded as being identical with the old Lop-nor of the Chinese. But the water they contained he pronounced to be fresh water. This identification was disputed by Baron von Richthofen, on the ground that the Lop-nor, the "Salt Lake" of the Chinese geographers, could not be filled with fresh water; moreover, being the final gathering basin of the desert stream, the Tarim, it was bound to be salt, more especially as the lake had no outflow. Przhevalsky visited the Lop-nor region again in 1885, and adhered to his opinion. But ten years later it was explored anew by Dr Sven Hedin, who ascertained that the Tarim empties part of its waters into another lake, or rather string of lakes (Avuluk-köl, Kara-köl, Tayek-köl and Arka-köl), which are situated at 42° 30' N., and thus so far justified the views of von Richthofen, and confirmed those of the Chinese accounts. At the same time he advanced reasons for believing that the old Lop-nor of Przhevalsky, the southern Lop-nor, are of quite recent origin—indeed, he fixed upon 1720 as the probably approximate date of their formation, a date which von Richthofen would alter to 1750. Besides this, Sven Hedin argued that there exists a close inter-relation between the northern Lop-nor lakes and the southern Lop-nor lakes, so that as the water in the one group increases, it decreases to the same proportion and volume in the other. He also argued that the four lakes of northern Lop-nor are slowly moving westwards under the incessant impetus of wind and sandstorm (buran). These conclusions were afterwards controverted by the Russian traveller, P. K. Kozlov, who visited the Lop-nor region in 1863-1864—that is, before Dr Sven Hedin's examination. He practically only reiterated Przhevalsky's contention, that the ancient Chinese maps were erroneously drawn, and that the Kara-koshun, in spite of the freshness of its water, was the old Lop-nor, the Salt Lake par excellence of the Chinese. Finally, in 1900, Dr Sven Hedin, following up the course of the Kum-darya, discovered—at the foot of the Kuruk-tag, and at the E. (lowest) extremity of the now desiccated Kuruk-darya, with traces of dead forest and other vegetation beside it and beside the river-bed—the basin of a desiccated salt lake, which he holds to be the true ancient Lop-nor of the Chinese geographers, and at the same time he found that the Kara-koshun or Lop-nor of Przhevalsky had extended towards the north, but shrunk on the south. Thus the old Lop-nor no longer exists, but in place of it there are a number of much smaller lakes of newer formation. It may fairly be inferred that, owing to the uniform level of the region, the sluggish flow of the Tarim, its unceasing tendency to divide and reunite, conjoined with the violence and persistence of the winds (mostly from the east and north-east), and the rapid and dense growth of the weed-beds in the shallow marshes, the drainage waters of the Tarim basin gather now in greater volume in one depression, and now in greater volume in another; and this view derives support from the extreme shallowness of the lakes in both Sven Hedin's northern Lop-nor and Przhevalsky's southern Lop-nor, together with the uniformly horizontal level of the entire region.

LOQUAT, JAPANESE PLUM or JAPANESE MEDLAR, known botanically as Eriobotrya japonica, small evergreen tree belonging to the natural order Rosaceae, with large thick oval-oblong leaves borne near the ends of the branches, and dark green above with a rusty tomentum on the lower face. The fruit is pear-shaped, yellow, about 1½ in. long and contains large stony seeds; it has an agreeable acid flavour. The plant is a native of China and Japan, but is widely grown for its fruit and as a decorative plant. It is a familiar object in the Mediterranean region and in the southern United States.

LORAIN, a city of Lorain county, Ohio, U.S.A., on Lake Erie, at the mouth of the Black river, and about 25 m. W. by S. of Cleveland. Pop. (1890) 4863; (1900) 16,628, of whom 4730 were foreign-born and 350 negroes; (1910 census) 28,883. Lorain is served by the New York, Chicago & St. Louis, and the Baltimore & Ohio railways, by the Lake Shore Electric railway, and by several of the more important steamboat lines on the Great Lakes. It has a Carnegie library, the Lake View Hospital and the Saint Joseph's Hospital. There is a good harbour, and the city's chief interest are in the shipping of great quantities of coal, iron-ore, grain and lumber, in the building of large steel vessels, in railway shops, and in the manufacture of iron pipes, gas engines, stoves and automatic steam shovels. The value of the factory products increased from $6,481,388 in 1900 to $14,491,091 in 1905, or 52.8%. The municipality owns and operates the waterworks. A Mormon mission was established here in 1878-1879, and a trading post in 1897, but no permanent settlement was made until several years later. In 1836 the place was incorporated as a village under the name "Charleston"; in 1874 the present name was adopted, and in 1896 Lorain became a city of the second class.

LORALAI, a town and district of India, in Baluchistan. The town, which is situated 4700 ft. above the sea, 35 m. by road from the railway station of Harnai, was occupied as a military station in 1886, and has quarters for a native cavalry and a native infantry regiment. Pop. (1901) 3561.

The District of Loralai was formed in 1903. It consists of a series of long, narrow valleys, hemmed in by rugged mountains, and bordered E. by Dera Ghazi Khan district of the Punjab. Area 7999 sq. m.; pop. (1901) 67,864, of whom the majority are Afghans. The principal crops are wheat and millet; but the chief wealth of the inhabitants is derived from their herds of cattle, sheep and goats.
LORCA—LORD ADVOCATE

LORCA, a town of eastern Spain, in the province of Murcia, on the right bank of the river Sangonera (here called the Guadalantin or Guadalentin) and on the Murcia-Baza railway. Pop. (1900) 60,836. It occupies a height crowned by a medieval fortress, among the foothills of the Sierra del Caño. Its older parts, Moorish in many features and with narrow irregular streets, contrast with the modern parts, which have broad streets and squares, and many fine public buildings—theatre, town hall, hospitals, courts of justice and a bridge over the Sangonera. There is an important trade in agricultural products and live stock, as well as manufactures of woollen stuffs, leather, gunpowder, chemicals and porcelain. Silver, sulphur and lead are found in the neighbourhood.

Lorca is the Roman Eliatroca (perhaps also the Ilorci of Pliny, N.H. iii. 3) and the Moorish Lurka. It was the key of Murcia during the Moorish wars, and was frequently taken and retaken. On the 30th of April 1802 it suffered severely by the bursting of the reservoir known as the Pantano de Fuentes, in which the waters of the Sangonera were stored for purposes of irrigation (1775-1785); the district adjoining the river, known as the part of San Cristóbal, was completely ruined, and more than six hundred persons perished. In 1810 Lorca suffered greatly from the French invasion. In 1886 the Pantano, which was one of the largest of European reservoirs, being formed by a dam 800 ft. long and 160 ft. high, was successfully rebuilt.

LORCH, a town in the Prussian province of Hesse-Nassau, romantically situated on the right bank of the Rhine, 8 m. below Rüdesheim by the railway Frankfort-on-Main-Wiesbaden-Cologne. Pop. (1905) 2209. It has a fine Gothic Roman Catholic church—St Martin's—dating from the 14th century. The slopes of the hills descending to the Rhine are covered with vineyards, which produce excellent wine. In the neighbourhood of Lorch, which was mentioned as early as 832, is the ruined castle of Nollich.

LORCH, a town in the kingdom of Württemberg, on the Rems, 26 m. E. from Stuttgart by the railway to Nördlingen. Pop. (1905) 3033. It possesses a fine Protestant church dating from the 14th century. Its industries include carriage-building and the manufacture of cement and paper. On the Marienberg lying above the town stands the former Benedictine monastery of Lorch, founded about 1108 by Frederick of Hohenstaufen, and in 1563 converted into an Evangelical college. Here Schiller passed a portion of his school days. The church contains several tombs of the Hohenstaufen family. The Roman limes began at Lorch and Roman remains have been found in the neighbourhood of the town.

See Kirn, Führer durch das Kloster Lorch (Lorch, 1888); and Steinle, Kastel Lorch (Heidelberg, 1897).

LORD, JOHN (1810-1894), American historical writer and lecturer, was born in Portsmouth, New Hampshire, on the 27th of December 1810. He was the nephew of Nathan Lord (1792-1870), president of Dartmouth College from 1828 to 1863. He graduated at Dartmouth in 1833, and at Andover Theological Seminary in 1837. His course at the Seminary was interrupted by a period of teaching—at Windham, Connecticut (1834), and at Norwich (1834-1835)—and by a tour in 1836 through New York and Ohio, in which he lectured on the dark ages. He was chaplain for the American Peace Society (1837-1839), and for a brief time was a Congregational pastor in turn at New Marlboro and West Stockbridge, Massachusetts, and at Utica, New York. About 1840 he became a professional lecturer on history. He lectured extensively for fifty years, especially in the United States and Great Britain, and introduced, with success, the mid-day lecture. He was lecturer on history in Dartmouth from 1860 to 1876. He received, in 1864, the degree of LL.D. from the University of the City of New York. From 1854 he made his home in Stamford, Connecticut, where he died on the 15th of December 1894. His works include, besides several school and college histories, The Old Roman World: the Grandeur and Failure of Civilization (1867); Ancient States and Empires (1860); Two German Giants: Frederick the Great and Bismarck (1885); and Beacon Lights of History (8 vols., 1884-1896), his chief contribution to historical literature.

LORD (O. Eng. hlâford, i.e. hlâfwâder, the warder or keeper of bread, hlâf, loaf; the word is not represented in any other Teutonic language), in its primary sense, the head of a household, the master of those dependent on him for their daily bread, correlative to O. Eng. hlâf-ælda, loaf-eater, servant; the word frequently occurs in this sense in the Bible, cf. Matt. xxiv. 45. As a term implying the ownership of property, “lord” survives in “lord of the manor” and “landlord.” The chief applications are due to its use as the equivalent of Lat. dominus, Gr. κύριος and Fr. seigneur; thus in the Old Testament it represents Yahweh, Jehovah, and in the New Testament κύριος, as a title of Jesus Christ. Selden’s words may be quoted for the more general meanings of “lord”; “the name Dominus is...to be thought of only as a distinguishing attribute of Greatness and as our English word Lord is; and that without any relation to the term lord for lord of property or to servitude, and only as it denotes such Superiors as King or Subjects of the greater Nobility with us and men of special Eminency in other States, known by the names of Heeren, Dons, Sieurs, signiors, seigneurs...and the like.” It is thus not only a general word for a prince or sovereign, but also the common word for a feudal superior, and particularly of a feudal tenant holding directly of the king, a baron (q.v.), hence a peer of the realm, a member of the House of Lords, constituted of the lords temporal and the lords spiritual; this is the chief modern usage. The prefix “lord” is ordinarily used as a less formal alternative to the full title, whether held by right or by courtesy, of marquess, earl or viscount, and is always so used in the case of a baron (which in English usage is generally confined to the holder of a foreign title). Where the name is territorial, the “of” is dropped, thus, the marquess of A., but Lord A. The younger sons of dukes and marquesses have, by courtesy, the title of Lord prefixed to the Christian and surname, e.g. Lord John Russell. In the case of bishops, the full and formal title of address is the Lord Bishop of A., whether he be a spiritual peer or not. Many high officials of the British government have the word “lord” prefixed to their titles; some of them are treated in separate articles; for lord privy seal see Privy Seal. In certain cases the members of a board which has taken the place of an office of state are known as lords commissioners or, shortly, lords of the office in question, e.g. lords of the treasury, civil or naval lords of the admiralty. For lord lieutenant and lord mayor see Lieutenant and Mayor. As the proper form of address “my lord” is used not only to those members of the nobility to whom the title “Lord” is applicable, and to bishops, but also to all judges of the High Court in England, and of the Scottish and Irish Superior Courts, and to lord mayors and lord provosts (see also Lady).

LORD ADVOCATE, or king’s advocate, the principal law-officer of the crown in Scotland. His business is to act as a public prosecutor, and to plead in all causes that concern the crown. He is at the head of the system of public prosecutions by which criminal justice is administered in Scotland, and thus his functions are of a far more extensive character than those of the English law-officers of the crown. He is aided by a solicitor-general and by subordinate assistants called advocates-depute. The office of king’s advocate seems to have been established about the beginning of the 16th century. Originally he had no power to prosecute crimes without the concurrence of a private party; but in the year 1597 he was empowered to prosecute crimes at his own instance. He has the privilege of pleading in court with his hat on.
